1881 CALIFORNIA  
STATE LIBRARY.

No. 153241

*Extract from the Political Code.*

SECTION 2296. Books may be taken from the Library by the MEMBERS OF THE LEGISLATURE, DURING THE SESSIONS THEREOF, and by other State officers at any time.

SEC. 2298. The Controller, if notified by the Librarian that any officer has failed to return books taken by him within the time prescribed by the Rules, and after demand made, must not draw his warrant for the salary of such officer until the return is made, or three times the value of the books, or of any injuries thereto, has been paid to the Librarian.

SEC. 2299. Every person who injures or fails to return any book taken is liable to the Librarian in three times the value thereof.

No person shall take or detain from the General Library more than two volumes at any one time, or for a longer period than two weeks. BOOKS OF REFERENCE SHALL NOT BE TAKEN FROM THE LIBRARY AT ANY TIME.—[Extract from the Rules.]

The foregoing Regulations will be strictly enforced.

VOLUME XLII.  
Number 1.

## A Pulley Turning Lathe.

The engraving given herewith represents one of the Niles Tool Works Company's pulley turning lathe, a specimen of which can be seen at Parke & Lacy's, in this city. This one turns to 50 inches in diameter and 24-inch face, and will be found a most useful special tool in machine shops.

This lathe is designed solely for the purpose of turning pulleys, gears (either bevel, miter or spur), rolls, and works of this nature. It is an entirely new departure, and may be called a perfect illustration of "the means being adapted to the end." All other tools designed to do this work, follow in the old beaten track, with but slight modifications on which to base claims of superiority. This machine has novel and distinctive features that may be briefly recited as follows: A large cone pulley, with six steps for a belt four inches wide, transmits the power through tangent gearing, to the main spindle;

## California Weather.

The people in the Eastern States have been lately crowing and congratulating themselves on their business boom, and commiserating with us on our dull time. Now they have a cold weather boom, and the commiseration is on our side. At the same time, we can congratulate ourselves that that part of the boom is going to stay where it belongs—on the other side of the mountains. It is our turn to be thankful, and to be thankful for a good deal. The telegraph tells us of snow, ice, sleet, blockaded roads, frozen rivers, frozen people, shrinking thermometers and heavy storms. In New York heavy storms interfering with travel, and loss of property on the beaches; Washington and all the avenues blocked with snow, and Potomac frozen over; worst storm since 1857. Columbus, Georgia; Greenboro, N. C.; Shreveport, Montgomery, Ala.; Norfolk, Va.; Columbia, S. C.; Chicago, Buffalo, Boston—all wrapped up in

San Diego; 51° above; Sacramento, 50° above; Visalia, 48° above; Red Bluff 50° above.

These figures speak volumes for the climate of this State. In this month of December the barometer varied very greatly. Between the 10th and 14th it fell from 30.445 to 29.486. On that day we had one inch and thirty-two hundredths between 1:30 and 8 P. M.

People who like a comfortable climate to live in, who don't care to sit by fires and wrap in furs and wool at all times, will still stick to California, even if there is a business boom in New York. They can make that but they can't make pleasant winters which are ready made for us here.

## Our Drift Mines.

To drift mining, a method by which hydraulic mining operations are sometimes very effectually supplemented, the remarks in an article on hydraulic mining last week may be largely applied; this branch of the business, like the others, having worked itself year

has been distinguished for its large profitable production; the East New York, which is now yielding liberally with heavy deposits of rich gravel opened up, and the Morgan claim, adjoining the Swamp Angel on the north, and in which the developments are represented to be first-class in every respect, if they lie not ahead of anything yet found on this ridge. This mine has also been explored and equipped in a very superior manner, having had the benefit of ample capital and an able management. The gravel in these mines yields from \$150 to \$300 per carload, a higher grade than the average throughout the State. At Forest City, Sierra county, the Bald Mountain mine maintains the forward position which it has for many years held as a drift enterprise, there being a number of other companies operating in that vicinity with an already achieved success, or prospects that may be considered equivalent to the same. The basin of Slate creek, lying a few miles farther to the northwest, is also the scene of many prosperous drift operations, of which latter there may also be counted not a few in Yuba, Butte and Plumas counties. In the northwestern

THE NILES SPECIAL PULLEY TURNING LATHE.

this is a steady and powerful method of driving, and is held in high estimation in England, where it has been tested through a range of work that demands the utmost steadiness, such as cylinder boring, etc. The carrier plate is of the equalizing type, obviating unequal and lateral strains. On each side of the solid bed piece is placed rests, which slide in and out on graduated surfaces to suit to the diameter of pulley to be turned; these rests can be set angularly to get any desired degree of "crown," tools are thus operated on both sides of the machine. The feeds are continuous, not intermittent. The feeds can be instantly engaged, disengaged or changed. Another feature of this tool is that the spindle of cone pulley runs at so much higher velocity than the main spindle, that its speed is suitable for polishing when the latter is turning; a steel mandrel and a suitable rest are provided for polishing, this arrangement secures a combination of machines. The countershaft has two pulleys 20 inches in diameter, 5½-inch face, which should run 130 revolutions per minute. Weight, 7,500 lbs.

The upper part of Montana is a very rich mining region, the mountains being full of iron, copper, lead, silver and gold, the latter being both in quartz and placer mines.

snow and ice. Some places with thermometer down to 30° below zero. Lots of places with thermometer at zero.

Here we are in San Francisco to-day (Thursday, Dec. 30th), with a warm sunshine, unclouded skies and pleasant weather. The thermometer to-day is 57° above. On the 24th, 25th and 26th we had the thermometer at 61° above zero. Think of that for Christmas temperature! These figures are for four o'clock in the morning, too, the coldest part of the day. We have had the thermometer up to 50° every day this month. The maximum range has been 51° to 61°, and the minimum range 56° to 42°. We had it down to 42° on one day, only. This for December!

Now note carefully the following figures for the 29th inst., Wednesday, at the time which corresponds to Washington time of seven A. M., which is about four A. M. here in San Francisco. On that day (29th), at Cheyenne, the thermometer was 13° below; Davenport, Iowa, 14° below; Des Moines, 17° below; North Platte, 23° below; Omaha, 13° below. The dispatches tell us of other places 15°, and 20°, and 25° below.

On our coast on that date (Wednesday), in San Francisco, at the hour named, the thermometer registered 53° above; Los Angeles, 49° above;

by year into a better position, its present status hardly suffering by comparison with any kind of mining extant. While drift mining is, to some extent, practiced wherever placer deposits abound, still in only a few localities do we find it prosecuted with system, and by methods that involve the employment of much engineering skill and necessitate expenditure of large sums of money. The following may be accounted the sites of its greatest activity and largest success in this State; where the business is carried on upon a scale not even approximated in any other part of the country: On the Forest Hill divide, Placer county, where the most noted mines consist of the Weske claim, near Michigan Bluff; the Hidden Treasure, at Sunny South; the Mountain Gate, at Damascus; the Bruce & Wheeler, at Bath, and the Dardenelles, lying near the town of Forest Hill. The Sunny South Co. extracted from their claim, last year, \$98,000 in gold dust, of which \$37,000 were paid, in the shape of dividends, to the owners; this being about the average rate of production made by the leading companies on this divide.

The ridge that separates Bear river from Steep hollow in the same county constitutes another noted drift locality, the prominent mines here being the Swamp Angel, which for several years

group of counties, before alluded to, much gold is taken out by the drift method, though the claims there are for the most part worked only in a small way. Drift mining, though it yields hardly more than a third or a fourth as much gold as is taken out by the hydraulic process, possesses some advantages over the latter in that it calls for less capital, and can be more generally engaged in. In short, the requirements necessary to success are, as a general thing, more easily met in this than in the hydraulic department of the business.

A REMARKABLY good sample of a paper that gives full justice to the specialty to which it is devoted, is the *Paper World*, a journal of information, discussion and recital as to paper, conducted by Clark W. Bryan, at Holyoke, Mass. Late copies of this monthly are replete with information about paper, interesting to users as well as manufacturers of that much used article.

SALT LAKE is supplying the mills and smelters of Idaho and Montana with salt, and that necessary commodity is costing during the present condition of the roads, from \$30 to \$40 per ton.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Ede;

### Glacial Observations in the Wind River Mountains.

(Written for the Press by CHARLES F. BLACKBURN.)

Much has been written of late years by various physicists about the geology and natural history of this noble range. The object of this letter is to give some information regarding the very interesting glacial region which occurs along the summit of these mountains.

During the months of August and September last, the writer, accompanied by Messrs. Johnson and Menefee, were engaged in investigating the glacial, geological and physical phenomena of the range; with, however, the objective purpose of determining the metallic wealth of the region. So, as my work lacked much of gathering full data of the glaciers, and, moreover, as this communication will give only a resume taken from my itinerary, I am fully aware of the fact that the description may lack much in giving important details, which are inevitably omitted.

For the topographical features of the region, I take the liberty to refer the reader to the excellent maps of Dr. F. V. Hayden. Along the summit of the Wind River range, between Wind River peak and the head of Tory creek, occurs a very interesting and

#### Extensive Glacial Field.

This important region has the venerable Fremont's peak for its keystone center. Living glaciers exist in the immediate vicinity, while others of considerable magnitude occur for a distance of 30 miles each way from Fremont along the trend of the range.

The writer ascended four of the higher summit peaks; also others that seem to vie with those that divide the continental waters, around all of which glaciers (some living) were observed. The great center, however, is in the immediate vicinity of Fremont's peak, the trend of range being north 45° west. Altitude of the summit peaks varying, according to Dr. Hayden, from 13,400 to 13,790 ft.; the former being the elevation of Wind River and the latter that of Fremont's peak. My own observations give higher elevations to all of these points—e. g., I found Fremont's peak to be 14,500 ft. However, as my estimates were taken with aneroid alone, I concede my results as merely approximations, and will not question the decision, but rather accept the determinations of Dr. Hayden as competent authority, unless proved erroneous by future investigations.

The latitude of this glacial region includes about 1° lying between 42° 45' and 43° 45' north; longitude, between 109° and 110° west. Along the northeast base of Fremont's peak occurs the great

#### Ice Sheet,

Extending for fully 20 miles, and lacking only a few rods at places of being contiguous throughout. At the heads of all the canyons the depressions may be observed heaped up with these dynamical frozen giants. From the foot of the glaciers to the base of the range occur profound gorges, over the surface of which exists *roches moutonnées*, lateral and terminal moraines, and many beautiful perpetual frozen lakes, over which the writer walked in August. Some of these

#### Remarkable Lakes

Were really frozen solid; no water being visible. The depth of the glaciers about the northeast base of Fremont's peak are evidently from 50 to 500 ft.; width, varying from one-half to two miles; length, from one to four miles. Many were observed to be moving, but, as usual, at a very slow rate. Another very interesting phenomena, regarding the glaciers of this region, is the profound attrition and erosion wrought by those that have long since vanished. Those yet lingering on these Alpine heights are mere pigmies, merely remnants of former greatness. It is very easy for the geologist to read their awe-inspiring records, while meandering over these frozen and solitary heights. Their history is legible in hold relief. The hot-toms of these glacial canyons are composed principally of groups of *roches moutonnées*, granite and gneiss hummocks, retaining their myriads of grooves and scorings. While often these crystalline tops present a beautiful polish, all done by the moving, but now vanished, mountain of ice.

Agassiz's fondlings (glaciated boulders) were observed all around the range, often several miles from its base. Large terminal moraines occur along the base, between Buffalo lake and Tory creek, especially in the vicinity of Dinwiddie creek. Also about the head of the latter stream the largest living glaciers may be observed, that exist in the Wind River mountains. While investigating the

#### Orological Phenomena

Of this great range, the mind is almost bewildered in grasping, or comprehending, the magnitude of causes and effects that lie before his vision. Chemical and mechanical denudation has wrought such profound topographical changes in the contour of the range, that its present

orographical relief seems almost incredible; Alpine heights and isolated pinacles—awe-inspiring—wearing their blue glacial gems in majestic silence; huge blocks of granite and gneiss, hills in themselves, occur on all sides, while deep chasms exist, filled with snow and ice which never melt.

Great amphitheaters, or horseshoe-like canyons, occur about Fremont's peak—vertical walls standing more than 2,000 ft. high—while, looming still above these, occur rugged crags, or granite domes, from which magnificent views of the surrounding country may be had. From these dizzy heights the observer may look over thousands of square miles, many of which show true rugged grandeur. So intense is the sublimity that pervades the noble sights from these lofty points that the observer becomes lost at his own insignificance, and hardly ventures a conception of his greatness to be more than "simply a terrestrial parasite." Lowering the eyes he meets the great organic records; the fossiliferous tomb, or Nature's profound hook of evolution. Beginning with the primordial and glancing through the series to the quaternary, the observer is again lost in trying to grasp, or comprehend, the great antiquity of this great natural hook (the only true history of creation), and for a consolation he can truly congratulate himself on being so fortunate as to be classed with the humble *genus homo*, and allowed the blessed privilege to live in the glorious circle of scientific light.

As I have previously said, my description regarding the glaciers would not give any details, it gives me much pleasure to announce to scientific men that such a region does exist in our country, and to those who wish to become acquainted with glacial phenomena need not go to the far-away Alps to acquire his information.

Lander, Wyoming Territory, Dec. 15, 1880.

### Simple Mining Laws.

EDITORS PRESS:—I concur in the views expressed in your issue of the PRESS hearing the date of Dec. 18, 1880, that our mining laws should be so simple that any miner could construe them without doubt, and the simpler the mining code of the country the better. If you are correct—and I do not doubt it—that Senator Teller proposes amendments to our mining statutes, one of which is that 1,500 linear ft. shall be the limit of a location in length, on lodes or veins, by any one, or more persons, and 300 ft. the limit in width on each side of the surface projection of the lode—such an amendment, it would appear to me, would be entirely useless, for the mining statute of May 10, 1872, Section 2, contains the following language which can be susceptible of but one construction: "A mining claim located after the passage of this act, whether located by one or more persons, may equal, but shall not exceed 1,500 ft. in length along the vein or lode. No claim shall extend more than 300 ft. on each side of the middle of the vein at the surface," etc. Does it not appear evident then, that our mining statute does not need amending in that particular? There is, however, an amendment needed to our mining laws, and I deem it a very important one. In the act of May 10, 1872, we find the following language: "On each claim located after the passage of this act, and until a patent shall have been issued therefor, not less than \$100 worth of labor shall be performed, or improvements made during each year." It would seem that this language is plain enough, and meant all that is expressed in it, viz., that every mining claim should have annually expended upon it \$100 worth of labor or improvements. It does not mean anything of the sort. No sir! It is true it says that clearly, plainly, emphatically; but consult any lawyer, and he will tell you that it refers to lode claims alone; that it is, and has been long settled in our courts, that it refers to lode claims only. I hold differently. Take the whole of the act together, the intention and meaning of it was to apply to all mines. "The miners of each mining district may make rules and regulations not in conflict with the laws of the United States governing the location, manner of recording and amount of work necessary to hold possession of the mining claim," etc. Why should not that part of the act, with equal force, apply to lodes and veins only? The language is in the same Section of the act. Yet our courts hold that this last applies to all mining claims, while the first applies only to quartz claims. Higher authority still, no less than the Hon. Commissioner of the General Land Office, interprets the language of the act as our courts do. The necessity of amending the act of May 10, 1872, so that its language and intent cannot be mistaken, lies in the fact that any man, or company of men, may go upon and locate 20, or 160 acres of placer mining ground, and the law—outside of a mining district—is silent as to what shall be done in the way of labor or improvements to hold the claim. Years subsequent to a location of a placer mine, under the operations of the act of May, 1872, some miner discovers a good mine, and proceeds to develop it, expending in the prosecution of such development thousands of dollars. Just at the point where he has begun to realize and make it pay, the original locator sets up his claim to the ground, and under the construction of that act by our courts, the mine is awarded to him. Here a great injustice is done unintentionally by a law that was designed and formed for the purpose of protecting miners and mining interests. I could call your attention

to thousands of acres of mining ground in this State, held by no other title than the above; but my letter is already too long, and I will close for the present. THOS. W. REECE, Oroville, Butte Co., Cal.

### A Rare Coleopterous Insect.

At the regular meeting of the Arthrozoic Club of this city, held this week, L. Edgar Ricksecker read a paper describing a very rare specimen of coleopterous insect. He said: I have the pleasure of exhibiting to you to-night a specimen of great rarity and exquisite beauty. It is the coleopteran *Plusiotis gloriosa*, Lec., which was procured for me lately by a friend traveling through the mining regions of Arizona. The genus *Plusiotis* belongs, according to Dr. Le Conte's classification, to the *Scarabaeidae pleu. rosticti*, which is the third division of the family, *Scarabaeidae*. It is purely American, five of its seven described species being found in Mexico, one in Chile, and this one in Arizona, and possibly as far west as San Diego, Cal.

It is nearly allied to the genus *Pelidnota*, of which the common grapevine beetle, *Pelidnota punctata*, Linn., of the Atlantic States, is the well-known representative; and in the same group with *Pelidnota* and *Plusiotis* is the genus *Cotalpa*, to which belongs the familiar *Cotalpa lanigera*, of a golden yellow color, and the hairy *Cotalpa granicollis*, the latter being found in Utah and as far north as eastern Washington Territory—possibly also in California.

All the species of this group are handsome insects; but this one, with its broad stripes and margins of polished gold, not only outshines all its near relations, but, in the language of Dr. Le Conte, "is the most beautiful coleopterous insect known." Many tropical species are more grotesque in form, more conspicuous in size, more gaudy in color, but in its exquisite neatness and brilliancy, *Plusiotis gloriosa* is not surpassed by any.

In size, this specimen is 27 m. m. (or a little more than an inch) in length, and 14 m. m. in breadth. Its form is more elongate and more convex than either *Cotalpa* or *Pelidnota*. The antennae are 10-jointed; the legs strong and massive, with the tarsal claws—like all the species of this tribe—of unequal lengths. The color, above, is a delicate, pale green. The thorax has a smooth, shining appearance, but under the lens shows fine, shallow punctures; its narrow, reflexed margin is banded by a continuous fillet of gold  $\frac{1}{2}$  m. m. in width. The head is of the same green color, rather rougher than the thorax. The eye large and black, with an occipital band of dull gold color connecting them. The elytra are striated with three broad stripes on each elytron, and a narrower, more imperfect one near the outer margin, each of these being rendered conspicuous by a smooth lining of pure, burnished gold. On the ridges between the striae are rows of fine punctures and specks of gold. Near the outer margins are two rows of fine punctures, and the margin itself is moderately reflexed and banded with gold. On each shoulder is a minute black dot. Beneath the head and thorax are of a brilliant gold color, running to green in the middle of the body. The legs and abdominal rings are green, banded with gold. All the under parts are more or less fringed with fine white hairs.

Of the life-history of this insect nothing is known; but we may well infer that it is similar to that of *Pelidnota* and other species of this group. They are leaf-eaters. The larvae subsist on decayed wood and vegetable matter, often remaining in the soil for several years before undergoing their final metamorphosis. *Pelidnota* lives on the grapevine; *Cotalpa*, if I remember correctly, on the willow;—*Plusiotis* is so rare that I doubt if its favorite food plant has ever been observed. The person from whom this specimen was obtained, informed me that but three had ever been found in that neighborhood. However, as this was at an altitude of perhaps 4,000 ft. above the sea, I doubt whether that particular locality can be considered as a part of its regular habitat. I think the valley of the Gila river is its most natural home. Here, under the all-pervading influence of a blazing, almost tropical sun, reared in the rich, metalliferous soil for which southern Arizona is famous, is brought forth the golden luster of this superb beetle.

Many species of the sub-family show a strong tendency to take on metallic hues. In this instance the combined influences of the intense solar heat, and the auriferous and argentiferous nature of the soil in which the larvae dig, and delves for its food, seems to augment this tendency to such a degree as to produce the brilliant result which we see in *Plusiotis gloriosa*.

The Harshaw mining company, of Arizona, is running 20 stamps night and day and is producing from \$100,000 to \$130,000 per month. No dividends have yet been paid.

The Osceola Con. Copper mining company, of Michigan, has declared a dividend of \$1.50 per share, aggregating \$75,000, payable in New York on the 2d of January.

The members of the U. S. Geological Survey who have for 16 months been at work in the vicinity of Eureka, Nevada, have finished their surveying work.

### Academy of Sciences.

Want of space in our last week's issue prevented our giving a report of this meeting of the California Academy of Sciences, which was held on the 20th ult. Prof. Davidson presided and a number of donations were made. The committee appointed to nominate a regular ticket for officers for the coming year reported in favor of the old officers as follows: President, George Davidson; First Vice-President, Justin P. Moore; Second Vice-President, Dr. Herman Behr; Recording Secretary, Charles G. Yale; Corresponding Secretary, S. B. Christy; Treasurer, Elisha Brooks; Librarian, Chas. T. Meyer; Director of Museum, W. G. W. Harford; Trustees, Wm. Ashburner, Col. George E. Gray, Robert E. C. Stearns, B. B. Redding, Thos. P. Madden, Ralph C. Harrison and J. M. McDonald.

Mr. C. D. Gibbs, who presented the Academy with a very valuable set of geological specimens, some 200 in number, read a paper on "The Geological Specimens Collected in San Francisco and Vicinity." This paper we give in another column.

#### Aleutian Mummies.

An interesting paper was then read, entitled "Contributions to the History of the Aleutian Isles," prepared by Dr. Arthur B. Stout, Curator of the Department of Comparative Anatomy, to whom was referred for investigation the two mummies presented to the Academy in 1874 by the Alaska Commercial Co., who received them in response to their instructions to their agents to collect and forward all material for scientific purposes, to be placed in scientific museums here and at the East. These mummies came from the Island of Kagamil, one of the group known as the Four Mountains, or craters. The island contains active volcanoes, and is not now inhabited. In the immediate vicinity of the cave from which these mummies were taken, etiam continually arises from a colfatar, and the soil is warm to the touch. Traditions place their age about the year 1756, or when Russians were first seen by the natives. They possess great interest as containing relics indicating the pursuits and handicraft of the Inuits before they were modified by the introduction of any adjuncts of civilization. No implements whatever were found about them. One was that of a woman, the other a man 5 ft. 11 inches high. The wrappings next the bodies were of sealskin. The crania were found entirely empty, and no traces of the viscera remained. The limbs were carefully folded against the body, apparently to make the embalmed package as tight and small as possible. The work is done with evident care and solicitude.

#### The Hurricane at Sitka.

A paper by Commander Henry Glass, of the U. S. S. *Jamestown*, now at Sitka, was read by Mr. Brooke. The hurricane took place October 20th, 1880. Careful observations were made on board the *Jamestown* every 10 minutes, of the height of the barometric temperature of the air, force and direction of the wind, and forms and general movement of the clouds. At 10 h. 35 m., October 25th, the barometer stood at 28.20, the wind blowing in terrific squalls, accompanied by rain. The wind marked 11 to 12, in the Beaufort system of notation. The temperature of the air fell from 53° to 44° Fahr. The first indications of the gale were noted October 23d, from which time the barometer gradually fell. The rotary column of the hurricane advanced at the rate of five to six miles per hour, and its course was determined by the configuration of the high land, the storm extending only 1,000 ft. high, to which height trees on the hillsides were prostrated, and above which they escaped injury. A heavy shock of earthquake occurred, as the storm-center passed over the southern flank of Mount Edgecumbe, an apparently extinct volcano, whose ancient crater was then exposed to the area of lowest barometrical pressure. Commander Glass inquires, did the sudden removal of an enormous atmospheric pressure over the crater of a recent volcano offer sufficient cause to account for the shock of earthquake noted simultaneously with the lowest barometrical observation? He thinks there was something more than a mere coincidence in this awakening of seismic activity. Several shocks succeeded, gradually decreasing in severity, in close correspondence with the rise of the barometer to its normal height in that latitude. Reports from the interior prove beyond question that Mt. Edgecumbe was the center of oscillation, decreasing in severity as their distance from Sitka increased. He concluded by requesting the Academy to scientifically investigate the important question of the relation of hurricanes and earthquakes, as indicated by their coincidence with areas of low barometrical pressure, or high electric tension.

Mr. B. B. Redding read a very valuable and interesting paper on "The Future of Fish Culture." This paper will shortly be published in full.

The Evening Star mining company, of Colorado, paid a dividend of five cents per share, aggregating \$25,000, at New York on the 10th. This makes \$100,000 paid by this company to date.

THOMAS H. FLETCHER, a resident of Sierra county since 1850, died last week. He was at one time Supt. of the Gold Bluff mine.

## MECHANICAL PROGRESS.

## The Roberts Locomotive.

Col. E. A. L. Roberts, of Titusville, has made a contract with the Baldwin Locomotive Works to build a passenger engine which he expects will be able to run 80 miles an hour, and maintain this rate of speed for 100 miles without stopping. The locomotive is to weigh 38 tons. The driving wheels will be six ft. in diameter. The forward trucks and those on the tender will be made of paper, which it is said will endure more strain and wear than iron or steel. The most important features of the locomotive will be the introduction of the Roberts patent cylinder and piston, the exhaust parts being in a continuous circle around the cylinder. The tender will be so constructed as to carry a foot of water under the coal, as well as the usual amount on the sides. There will be a water chamber on the locomotive so arranged that compressed air from the air pump can be admitted in the top of the chamber upon the water, by which means a stream may be forced upon any hot bearing connected with the engine or tender. This is expected to overcome the trouble of hot boxes. The nozzles through which the steam is to pass and create a draft will be eight inches in diameter, and the boiler will be the largest that can be put upon the standard gauge trucks. Col. Roberts, the inventor, says that he built a similar locomotive a few years ago which drew the fast mail train over a portion of the Lake Shore railway, but it was not a success, owing to its poor construction. The improvements it suggested will be taken advantage of in building the new engine.

**STEEL AS A STRUCTURAL MATERIAL.**—At a recent meeting of the Society of Engineers, Paris, a paper, entitled "Modern Steels as Structural Materials," was read by Mr. W. W. Beaumont, C. E., the object of which was to call attention to the structural inferiority of the modern very soft steel as compared with the structural value which steel made by the Bessemer and other processes promised to possess ten years or so ago. At that time the high tenacity of steel then being produced seemed to indicate that it would afford engineers considerable facility for building lighter structures than was possible with iron. Attempts to employ this steel for bridge and boiler work, however, showed that it was necessary to impart greater toughness to it, and since that time steel manufacturers had labored to effect this by producing very soft and ductile steels. If necessarily accompanied by a low elastic limit it involved a loss in efficiency. It thus appeared that constructors were in danger of losing all the advantages which the application of steel to structural purposes promised a dozen years ago to secure, although steel may now be obtained of greater uniformity and trustworthiness than was possible at that time.

**CARBON IN STEEL.—BURNED STEEL.**—Prof. Leeds has found that the amount of carbon in a piece of steel which had been purposely burned, was the same as in a similar piece which had not been burned; the burning, however, was of the steel itself, which contained a large amount of the oxide of iron, that is, the metal instead of the carbon burned. The heat, he says, does not harm steel or iron, and consequently they may be heated and cooled an unlimited number of times, provided they are not brought in contact with the air and so take up oxygen. In heating a piece of steel, the amount of blast has more to do with the burning than the heat; and if the extra amount of oxygen which a burnt piece of steel has taken up is taken out of it, it can be made to work just as well as it did before. The proof that the heat does not harm the steel is found in the fact that if the steel is put in a closed box, and luted up so as to keep out the air, it can be heated and cooled an unlimited number of times without injury.

**CRANK PINS.**—There are few things more troublesome to an engineer than a hot crank pin, and it is sometimes very difficult to get at the real reason why it heats. Among the principal reasons for heating are: The mainshaft is not "square" with the engine, or, that the pin is not properly fitted to the crank, or perhaps it is too small in diameter; defects which are to be remedied as soon as practicable. Heating is often caused by the boxes being keyed too tightly, or by insufficient lubrication. There are now several good self-feeding lubricators in the market which will supply the oil to a crank pin continuously; these are recommended rather than the old style of oil cup, which was not only uncertain, but doubtful in its action.—*The Indicator.*

**STRENGTH OF IRON CHAINS FOR BRIDGES.**—Prof. Banschinger has lately tested some iron taken from a chain bridge built in 1829, and found that after 50 years of service its strength and elasticity had not altered perceptibly from what they were reported to be at the time they were put into service. The fact that age has little effect on the quality of iron, is likewise verified by the result of tests made by Prof. Thurston of pieces of wire cable of the historic Fairmount suspension bridge at Philadelphia, lately taken down after 40 years of service. The tested pieces were found to have a tenacity, elasticity and ductility fully equal to the best wire of the same size found in the market to-day.

## Hardening and Testing.

To really test the hardness of the surface of metal, we must take a new, or at least a good, dead smooth file, and apply one corner of it to a corner rather than on a flat surface of the metal to be tested, pressing the file very firmly against the work. A coarse file, even if a new one, is useless to test with. The greatest degree of hardness is obtained by plunging the red-hot steel into mercury. Steel hardened from the surface inward is hardest on the surface, while in steel that has been tempered the exterior is the softest. In the one case, because the surface was cooled in advance; in the other, because it was heated in advance. Files are hardened in the following mixture: Two parts (by weight) of salt, 15 of rye grit and 30 of burnt cow hoofs, all ground together and mixed with a sufficient quantity of water to make a pasty mass, with which the files are covered. When dry they are placed in a fire. If, during the heating, the coating should drop off at certain places, the files are promptly withdrawn and the place exposed is covered with dry roof powder. It is returned to the fire, where it is left until a temperature is reached which best suits the steel of which the file is made. Then it is plunged vertically into the bath, care being taken not to move it to the right or left, as that would cause warping. The bath is made in the following manner: 23 parts of salt are dissolved in about 5 parts of water, to which a handful of iron scale is added. The tangs are softened by being plunged into red-hot lead.—*Manufacturer and Builder.*

**UNIFORM MOTION.**—It is always desirable that the motion of a machine should be regular. Even supposing that the first mover is perfectly constant and equable in its action, the machine may not be regular in its movement, from the irregularity of the resistance to be overcome. But still, if both the power and the resistance were perfectly regular, the machine would not be perfectly uniform in its motion, for there are particular positions in which the moving parts of a machine are more efficacious than others, as in the crank, for instance; hence, the energy of the first mover will be unequally transmitted, and irregularity in the motion of the machine will consequently follow. The motion of some machines bears a constant tendency to accelerate and retard, and others alternately to accelerate and retard; and, perhaps, in no case whatever can the motion of a machine be said to be perfectly uniform, but common sense will point out the necessity of having the motion as uniform as it can be made, else it will increase in proportion as it is multiplied through the machinery.—*Ec.*

That wonderful locomotive, built at Paterson, N. J., for an inventor, who, in his design turned the ordinary locomotive topsy-turvy and imparted power to the driving-wheels by friction, has been tried, and is said to have given remarkably good results in drawing heavy loads up grade, but it has not yet been tested for speed. On an up grade of about 12½ ft. to the mile, the engine pulled 21 cars weighing over 474 tons, with such ease that more cars were added to the train in successive experiments, until finally 39 loaded cars, weighing 862 tons, were pulled over the same grade with from 135 to 140 lbs. of steam. In this engine the cylinder and the moving parts are above the boiler, so as to permit the use of double drivers, one set above the other, so proportioned as to give great speed to the driver, resting on the track, and to which power is imparted by friction.

**THE WELDING QUALITIES OF MILD STEEL.**—The manufacture of mild steel is not yet sufficiently well understood for it to displace the higher qualities of wrought iron, inasmuch as it will not weld, and the causes have not yet been ascertained why some bars of mild steel will weld and some will not. Till more light is thrown on this subject, and till all bars put into an ordinary blacksmith's hands will weld with certainty, says Mr. E. Windsor Richards, so long will good wrought iron hold its own; "but I have no doubt in my own mind that not many years will pass away before this problem is satisfactorily solved. Some very mild basic steel has been made sufficiently soft to weld, but it requires a much higher heat than iron. This is easily understood; every blacksmith knows that the better quality of the material the higher heat it will bear."

**A NEW SHIP BERTH.**—An English inventor has patented a new ship berth, having for its design the avoidance of sea sickness. The principle on which this berth is built is that of balance upon the universal joint, in such a manner that the weight of the person reclining upon the berth causes it to maintain a uniform and perfectly level surface, no matter how much the ship may pitch or roll; besides this, the berth is further controlled by means of strong india-rubber bands, fixed at each side, to prevent the possibility of its springing up in sudden jerks. The principle of an automatic self-leveling ship's berth seems good, and we have no doubt that such a berth might lessen the immediate effects of the movements of the ship upon those who suffer from sea sickness.

**AN ECONOMICAL PUMP.**—The Boston *Journal of Commerce* computes, from somewhat imperfect data, that the engine built by Corlies for the Boston Committee of Improved Sewerage, showed a duty of 128,398,309 ft. lbs. with 100 lbs. of coal.

## SCIENTIFIC PROGRESS.

## Opposition to the Metric System.

A few years ago it seemed as if the advocates of the metric system of weights and measures were having things all their own way in the learned societies and in the public print. Now it looks as if the tides were turning against them. At the first annual meeting of the American Society of Mechanical Engineers, recently held in New York, Mr. Coleman Sellers, of the well known firm of Sellers & Co., read a paper on the use of the metric system in the workshop, in which he stated that after his firm had had 20 years of actual experience with it in their shop, they had found it less convenient and in every way less adapted to their needs than the old system.

They built a shop for the manufacture of the Giffard injector, and every drawing and every scale template and gauge for these injectors has been for 20 years made on the metric system, and yet after all this experience he is convinced the metric system is not adapted to our use. Some theorists urge its adoption throughout the entire world; others wish its use prohibited. There is not one lathe in the world, not even in France, ruled by the metric system. It is not practical in drawing, neither can it be conveniently used in the machine shop. Our own system is by far superior to the metric system. Therefore let us hold fast to that which is good.

Mr. Sellers makes use of the following language: "As an engineer I can see no possible good to come to American machinists from the change. Its introduction exclusively would not diminish his labor in any way; it would not cheapen his product, it would increase its cost. It is in fact, however, so impossible, in view of existing matters, and existing harmony in interchangeable matter, that should the metric standard be made the only legal standard in America to be used in buying or selling, the engineering establishments now in existence could not heed the law, but must perforce use their existing tools and gauges of precision, and continue to make material in conformity with existing matter."

To show that Mr. Sellers is far from being alone in his opposition to the metric system, we take the following from a report of the meeting:

Mr. Henry R. Worthington asked leave to offer a resolution. For the first time he found himself in the presence of a body which he considered competent to speak for the mechanical engineers of the country. He looked upon the utterances of those who, pretending to speak for the mechanical profession, had favored the legalizing of the metric system, as a gratuitous impertinence, and he should much like to hear an expression of the views of the meeting on the subject. His resolution was as follows:

*Resolved,* That this society deprecates any legislation tending to make the adoption of the metric system of measures obligatory in our industrial establishments; also,

*Resolved,* That the Secretary be instructed to communicate the sentiments of this resolution to all concerned in procuring such legislation, and also to send a copy to the Anti-Metric Society of Cleveland.

It was evident that the sympathy of the audience was strongly in favor of this resolution, and that a majority of those present were eager to give expression to their opposition to the metric system. However, it was finally decided that, as the resolution committed the society to an expression of views, it should be voted upon by a letter ballot.

## To Protect Lead against Corrosion.

Prof. Emerson Reynolds describes a process for the protection of lead against corrosion, which is done by coating it with a film of sulphide of lead. He recommends the following method: Take 16 grams of solid caustic soda, dissolve it in 1.75 liters of water, and add to the liquid 17 grams of nitrate of lead, or an equivalent of other lead salt, with 250 cubic centimeters of water; raise the temperature of the mixture to 90° C. If sufficient lead salt has been added the liquid will remain somewhat turbid after heating, and must then be rapidly strained or filtered through asbestos, glass-wool or other suitable material, into a convenient vessel. The filtered liquid is then well mixed with 100 cubic centimeters of hot water, containing in solution 4 grams of sulpho urea or thio-carbamide. If the temperature of the mixture be maintained at about 70° C., deposition of sulphide of lead or galena, in the form of a fine adherent film or layer, quickly takes place on any object immersed in or covered with the liquid, provided the object be in a perfectly clean condition and suitable for the purpose. When the operation is properly conducted a layer of galena is obtained which is so strongly adherent that it can be easily polished by means of the usual leather polisher. It is not necessary to deposit the galena from hot liquids, but the deposition is more rapid than from cold solutions.

**OLD MEN AS SCIENTISTS.**—Recently Prof. Huxley said that 99 men out of every 100 became simply obstructive after 60 years old, and were not flexible enough to yield to the advance of new ideas. The world, he thought, would be benefited by any man who had taken part in science, being strangled after 60.

## Duration of the Arctic Winter.

Lieut. Schwatka, the Arctic explorer, gives some interesting facts in regard to the character and duration of the Arctic winter. He says:

"The generally received opinion that the Arctic winter, especially in the higher latitudes, is a long, dreary one of perfect opaque darkness, is not strictly correct. In latitude 83° 20' 20" N., the highest point ever reached by man, there are 4 hours and 42 minutes of twilight on December 22nd, the shortest day in the year in the Northern Hemisphere. In latitude 82° 27' N., the highest point where white men have wintered, there are 6 hours and 2 minutes in the shortest day, and 323 geographical miles from that point must yet be attained before the true Plutonic zone, or that one in which there is no twilight whatsoever, even upon the shortest day of the year, can be said to have been entered by man. Of course, about the beginning and ending of this twilight, it is very feeble and easily extinguished by even the slightest mists; but, nevertheless, it exists, and is very appreciable on clear, cold days, or nights, properly speaking. The North Pole itself is only shrouded in perfect blackness from November 13th to January 29th, a period of 77 days. Supposing that the sun has set (supposing a circumpolar sea or body of water unlimited to vision) on September 24th, not to rise until March 18th for that particular point, giving a period of about 50 days, of uniformly varying twilight, the Pole has about 188 days of continuous daylight, 100 days of varying twilight and 77 of perfect inky darkness (save when the moon has a northern declination) in the period of a typical year. During the period of a little over four days the sun shines continuously on both the North and South Poles at the same time, owing to refraction parallax, semi-diameter and dip of the horizon."

**ANTHROPOLOGICAL SOCIETY.**—On February 10, 1879, a few gentlemen interested in the study of man met in the Smithsonian Institution to devise a method of mutual improvement. The effort resulted in the formation of the Anthropological Society of Washington, with Major Powell for president, and Dr. Reynolds and Prof. O. T. Mason as recording and corresponding secretaries. Twenty-four papers have been read, which, if one might judge from their titles, are most interesting and valuable contributions. We learn from the *American Naturalist* that it is not yet decided whether a journal will be published, inasmuch as the Smithsonian Institution and the Bureau of Ethnology "afford ample opportunities of preserving all papers of permanent value." Without doubting this fact, we still hope that this young and vigorous society may not only have its own publication, but also that a long career of activity may ensue to provide the material for filling the pages of the same.

**PROF. BELL IN PARIS.**—It appears that the address which, as we have already noticed in these columns, Prof. Bell was to deliver before the Society of Arts, in Paris, on his new discoveries in regard to the transmission of sound by rays of light, attracted an unusual share of attention. Large numbers were unable to gain admission, for which reason arrangements were made to have it repeated by another gentleman, as the Professor's engagements were such that he could not get the time to deliver it again himself. It is remarked of this, by a French journal, that, "unlike many discoveries, the telephone was not the subject of a patent. Practical electricians had been compelled by Prof. Bell's previous discoveries, to study the science of sound, and would now have also to take up that of sight. Prof. Bell had again opened out to the physicist new ground where everything that was delightful was to be investigated."

**CURIOUS EXPERIMENT IN MAGNETISM.**—The following experiment is described by M. Obalski, in a communication to the Académie des Sciences: Two magnetic needles are hung vertically by fine thread, their unlike poles being opposite one another. Below them is a vessel containing water, its surface not quite touching the needles. They are hung so far apart as not to move toward one another. The level of the water is now quietly raised by letting a further quantity flow in from below. As soon as the water covers the lower ends of the needles they begin to approach one another, and when they are nearly immersed they rush together. The effect appears to be due to the fact that when the gravitation force downwards is partly counteracted by the upward hydrostatic force, due to immersion, the magnetic force, being relatively greater, is able to assert itself.

**THE FUEL OF THE FUTURE.**—It is claimed in many quarters that petroleum is to be the fuel of the near future; the difficulty of controlling its intense heat has been found to be serious, as a petroleum flame impinging on iron soon causes it to weaken. Dr. Durvee has apparently overcome this in his blow-pipe principle, where he forces a mixed air and oil blast through a central flue of a long cylinder boiler. As the gases are mixed in a fire brick furnace before entering the boiler, the danger of burning the iron is obviated. Wonderful results are predicted from this, as it is claimed that a flame 40 ft. long through an eight-inch flue will afford about a hundred horse-power at a cost of five gallons of oil per hour.

**THE NORTH BLOOMFIELD.**—Nevada City *Herald*, Dec. 24: Work at the North Bloomfield hydraulic diggings progresses with the usual amount of activity. The company is employing a full force of men, with which agents, number nearly 200, are about 3,000 inches of water are being run through their ditches.

**HYDRAULIC RIG.**—George E. Turner has just completed a very fine hydraulic rig for Yu Wen & Co., at Moore's Flat. The bulkheads are 65 inches in diameter. There is attached 1,700 ft. of 22-inch pipe, 600 ft. of 26-inch and 300 ft. of 30-inch. It occupied 20 days to manufacture the whole lot, and when put up will be one of the finest hydraulic rigs in the country.

**THE MOUNT AUBURN.**—The developments in the Mount Auburn quartz mine, owned by C. K. Kerby, and situated 2 miles northwest of town, are daily becoming more encouraging. The ledge proves to be very rich, both on the hanging and foot walls, and contains rich sulphurates and plenty of free gold. The prospects of this claim are of such a bright character that the probabilities are that ere long the Mount Auburn will be opened up many years ago, but was considered worthless by those who spent a little money in trying to develop it. In fact, during the last 5 years so little work was done in it that it was considered jumpable. It was attempted, and resulted in a lawsuit between Solomon Johnson, deceased, who was then the owner, against Tilley Holland & others, but the case was decided in favor of the former. A few years ago, C. K. Kerby, the present owner, purchased over a year ago, the claim and furnished capital to commence operations and develop it. His operations are proving to be successful, and there is not the least doubt but what he has a valuable piece of mineral property. There are many other claims in this vicinity that are now lying idle for the want of small capital to work them, and which would, with systematic and economical working, prove to be valuable mineral resources to the country.

**PROSPECTS.**—Dutch Flat *Forum*, Dec. 25: Last week O. B. Chadwick and William Thraen brought to our office about \$30 worth of gold they had just cleaned up from the contents of 4 carloads of gravel from the new incline in the East New York mine. The sample lot consisted of nuggets and dust of the coarsest quality. The largest nugget weighed a little more than 35, and the gold was of a fine quality. The East New York is located in the deep hollow section, in Nevada county, about 6 miles from Dutch Flat, and is owned by L. P. St. Clair, who owns a 1/2 interest, and G. B. Chadwick, William Thraen and Charles Harvey own the other 1/2 interest, all of whom are residents of this place. The proprietors have been engaged in running a hedrock tunnel for the past few years, which is now in a distance of 2,000 ft. At the end of the tunnel an incline was started, in which the sample lot of gold was found. They say the gravel looks fine and every indication of a big run is excellent.

**PLAGER.**—Cisco *Con.*—Dutch Flat *Forum*, Dec. 25: The Cisco Con. company has just got the necessary machinery for a 10-stamp quartz mill on the site of its mine, about 3 miles from Cisco, across the Yuba river, on Red mountain. The mill will be erected as soon as possible, when work of crushing quartz will be commenced. Some years ago a large number of claims were located on Red mountain, but nothing has been done in that section until the Cisco Con. company commenced active operations about 2 years ago. This company has an extensive ledge of gold-bearing quartz, and has developed it by running a tunnel some 2 1/2 miles into the hill and sinking a shaft 50 ft. deep at the end of the tunnel. They also have run 2 crosscuts 40 ft. long. So far as developments have been made, at no place have they worked through the ledge. The Red mountain section will undoubtedly prove one of the best paying quartz mining sections in this part of the State, at no distant day, when it becomes more fully developed.

**PLUMAS.**—Cherokee—*Greenview Bulletin*, Dec. 22: This company is having several large sleds built for the purpose of hauling ore from the mine to the mill, a distance of about 14 miles. They are double runners, are very strong and are being heavily trawled by William Stevens, at his blacksmith shop.

**ROUNDT VALLEY WATER CO.**—The new pipe in the line of the Green Mountain ditch across the McClellan ravine has been put in place, and the water turned in. It works perfectly satisfactorily, and will obviate the difficulty of maintaining a ditch across the ravine, as the frequent slides during the winter and spring months have rendered it almost impossible to keep the ditch in order.

**GREEN MOUNTAIN.**—Several new buildings have been constructed recently for business convenience. A changing house for the use of the men has been erected at the mouth of tunnel No. 4, 12x16 ft. An office 16x22 ft., a woodshed 16x21 ft. and a cellar-house 10x16 ft. have also been put up. A barn 30x36 ft. is in course of construction, and will soon be completed. Both mills are running steadily, and all business pertaining to the mine is moving forward regularly.

**SIERRA.**—Rich Nunners. *Mountain Messenger*, Dec. 25: Darling & Cox recently found in the sluice at their gravel claim, on Howard creek, 4 miles north of Bassett's, 2 pretty good specimens. The largest is valued at about \$50, and the other \$20. Indications are good for more, as 1 piece last summer was taken out of these diggings worth \$207. This is a telling argument against those who prate there's nothing left in the Sierra mines.

**CONTRACT LET.**—The Wilbourn Con. mining company has let a contract to run 300 ft. of hedrock tunnel on its claim, at \$1.90 per ft., the contractor furnishing everything. Wm. Wilbourn has the job.

**GREEN PATE.**—The 7 tons of Forest Green rock, worked at the Gold Bluff mill, resulted in a return of \$36 per ton. The yield is highly satisfactory. The company is pushing its tunnel into the mountain. A lower tunnel will be started in the spring.

**TRINITY.**—At Work. *Trinity Journal*, Dec. 25: Miners are now all at work with a good supply of water, and indications for a continuance are quite favorable. Sufficient rain has fallen up to this time to soak the ground pretty thoroughly, and with the rains we get in the future will be of direct benefit to the miners.

**STRUCK THE LOSE.**—We learn that the men working for Mr. Grayson on the Brown Bear mine, Deadwood district, have struck the lode some distance below the surface, after running about 130 ft. of tunnel. Report also says that it prospects fully as well at the bottom as on the surface, which is considered sufficient inducement for putting up a mill and building a wagon road to French Gulch in the spring.

**NEVADA.**—WASHOE DISTRICT. The following statements, made by Superintendents, are for week ending Dec. 27th:

**SIERRA NEVADA.**—During the week 181 tons and 1,000 lbs. of ore have been extracted. There were 04 cars of ore sent to the California mill, the average assay of which was \$27.44. The average assay of ore raised during the week was \$22.10.

**UNION CON.**—During the past week 255 1/2 tons of ore have been extracted from the 2500 level, and 333 tons and 1,200 lbs. were sent to the mills; assay value, \$23.54. On the 2500 level drift hole No. 4 has been extended 140 ft.; assay from a trace to \$31.

**CALIFORNIA.**—During the past week 414 tons of ore have been extracted and sent to the mill; assay value, \$20.03. On the 2300 level are cutting a drain in the north drift and enlarging the connection.

**HALE & NORTON.**—Extended west crosscut, 2400 level, 38 ft.; face in quartz and porphyry. Have replaced the 11-inch air-pipe with 16-inch pipe, to facilitate the work. Will resume drilling by the 24th inst. Hoisted from 2100 level 30 tons of ore, assaying \$145 per ton.

**OVERMAN.**—Station north winze has been completed, and have started an east drift from same which is now in 34

ft. from winze. Forman shaft has been sunk and timbered 30 ft.; total depth, 1,555 ft.

**C. N. S. SHARP.**—Another carload of material for the hydraulic pumps has arrived, and the work of putting in the pump has been resumed. Shipments of the engine have been commenced, but none of it has yet arrived.

**OPHIR.**—On the 2500 level the joint Mexican east winze has been sunk and timbered 13 ft., the joint Mexican west crosscut 14 ft., the California upraise 12 ft. and the joint California east crosscut 37 ft.

**CALIFORNIA.**—Pumps have run an average of 13 1/2 hours per day, consuming 5 1/2 cords of wood per day. Forman shaft has been sunk and timbered 30 ft.; total depth, 1,555 ft.

**CON. VIOLINA.**—During the week 1,080 tons of ore have been extracted and sent to the mills; assay value, \$23.12. On the 2300 level the south drift has been advanced 29 ft.

**CON. IMPERIAL.**—During the week have been repairing station 2135 ft., which were were compelled to destroy during the late fire to prevent the spreading of the flames.

**UNION SHARP.**—The shaft has been sunk and timbered 7 ft.; are cutting out tank-pit at the 1000 level, a bob-pit at the 2200 level, and easing timbers at the 2400 station.

**SAVAGE.**—The shaft force has, during the week, been engaged in usual repairs, and the drift force has been engaged in extending the drift on the 10th level.

**CHOLAN.**—The south drift on the 2400 level was advanced during the past week 31 ft. through porphyry, clay and quartz. The formation is still dry.

**UTAH.**—During the past week the east drift on the 1950 level has been advanced 14 ft. On the 2150 level the east drift has been extended 21 ft.

**C. & C. SHARP.**—During the week the shaft has been sunk 5 ft.; total depth below the 2300 level, 184 ft.

**G. & C. AND B. & B. SHARP.**—Have sunk and timbered the shaft during the week 15 ft.; total, 1,950 ft.

**EUREKA DISTRICT.**—Eureka *Sentinel*, Dec. 22: There is much depending upon the work being done in the Titus mine. All about this property are locations in which many of our citizens are interested. They look for Mr. Atchinson, the Williamsburg folks or the Titus company to make things lively in their camp ere long. Everybody knows that the Williamsburg has a large quantity of low-grade ore, and the Mr. Atchinson is prospecting, with good indications and some ore. We were told that the Titus folks yesterday afternoon cut a stringer of fair assaying ore, and they are not near the ground where they expected to tap the ore vein. The striking of a good ore body in the Titus would help that immediate section of our district, because it would induce the expenditure of large sums which are now in the pockets of Eastern capitalists, but who only need showing the return of their capital, with interest, to make them put up.

**SHIPPIN.**—Charley Bro's teams delivered 11 tons of ore from the Grant mine, just southwest of Ruby Hill, to the Eureka Con. furnaces, yesterday, for treatment. The Grant has been worked on lease of late, and in the years gone by has yielded more than any other property on McCoy hill. One feature of its notoriety is the remarkable richness of its deposits, some assays running away up into the hundreds. The Needles mine is adjoining the Grant, and has yielded some very rich ores.

**MINING NOTES.**—The late storm has greatly retarded assessment work. Very encouraging developments have recently been made in the Sterling mine. Sullivan & Co. are doing work on the claims between the Lord Byron and Deane mines. A body of good ore has been struck in the Banner mine, which will probably improve as development is made. McDowell, Superintendent of the Titus, and other mines is doing assessment work on all the mines under his charge. The recent stormy weather on Prospect mountain has deterred many miners from completing their assessment work. Rose & Burgess have just had some ore sampled from the Woodchopper mine, at Spring Valley, which went some \$500 to \$600 per ton at the Eureka works. Seven tons of ore were brought in from the Rescue mine, in White Pine county, yesterday, and sampled at the Eureka Con. works, which will assay in the hundreds.

**CHERRY CREEK DISTRICT.**—No Need to Rush. *Ward Reflex*, Dec. 26: John Doscher, who came over from Cherry Creek Sunday last, says the people over there are at a loss to know what is causing the rush to that place. No more work, he says, is being done there at present than at any other time during the year. The mine—the Star and Exchange—are being worked, and the 6-stamp and Star mills are running on ore from the Exchange and Star mines. The only other work going on in the district pertaining to mining is the grading of the Teacup mill site. The people are looking forward next spring and have great expectations.

**GRANTSVILLE DISTRICT.**—BROOKLYN. *Grantsville Bonanza*, Dec. 25: In the west drift of the lower level of the Brooklyn mine some very rich ore is being passed through of unknown extent. The ore extracted in running this drift is being worked with the balance of the Brooklyn ores in the Alexander mill, and is materially increasing the value of the pulp. The Brooklyn, being the largest mine in the district, has been doing well in the market, as the ore continues to improve in extent and richness as the mine is opened.

**THE CENTINIAL.**—Work progresses satisfactorily in this location of the McMahon and Irvine M. Co. The horse reported in the last issue of the *Bonanza* has been passed through, and the ledge is as solid and compact as ever again, the ore being very fine and showing chloride and black matrix. The ledge continues to widen as the drift is extended, and the prospects are very flattering for opening up an extensive body of fine milling ore.

**THE ALEXANDER.**—Work continues as usual in the Alexander mine, which is producing an increased quantity of ore of a higher grade. The ore stopes are looking better and better every day. The Alexander is undoubtedly one of the highest mines ever opened in eastern Nevada, and there are immense bodies of pay ore in eight that promise a long and profitable run for the Alexander company's mill.

**MOHAWK VALLEY DISTRICT.**—MINING IN THE VALLEY. *Reno Gazette*, Dec. 27: Isaac Weston, Joshua Laws and other Reno men have come into the property in the Mohawk Valley which they have been developing. They set up there last fall the little 2-stamp mill which had been running here during the summer. By the time they got it in operation, snow obliged them to shut down. This winter they are working in the mine and taking out ore for milling in the spring.

**PARADISE DISTRICT.**—THE CURTIS MINE. *Grantsville Bonanza*, Dec. 25: From E. E. Tarrant, who has just returned from Paradise district, we learn that about 40 tons of ore have been shipped from the Curtis mine to Virginia City for the purpose of having it assayed. This mine is one of the many locations owned by Messrs. Curtis, Welch, McLaughlin and Baldwin.

**TAYLOR DISTRICT.**—POOR RETURNS. *Ward Reflex*, Dec. 26: Some parties, a short time ago, shipped 2 1/2 tons of ore from Taylor district to Salt Lake for reduction, that was, when it started; sufficiently rich to justify shipping to a more distant point. Visions of untold wealth haunting the Mormon teamster, he divided with them, and "salted" the remainder with common rock. The returns are anything but satisfactory, and it would be up-hill business to attempt to convince the owners of that ore that Latter Day Saints won't steal.

**WARD DISTRICT.**—THE OLD FORMATION STRIKE. *Ward Reflex*, Dec. 26: The same formation has been struck in the crosscut north in the main tunnel, 2,400 ft. from the mouth, which is now in 30 ft., in which the ore bodies were found in the upper workings of the Paymaster. Another crosscut south, 2,100 ft. from the mouth of the tunnel, has run into the same formation, and the continuation of the Paymaster crosscut will be started from the face north to explore the

old carbonate chamber, the extent of which was never found in the upper workings.

**CROSSCUTS NORTH.**—The work of driving the Martin White main tunnel ahead has been stopped and a crosscut started north instead. The crosscut to the south is now in over 300 ft.

**WHITE PINE DISTRICT.**—ESRIHARDT & AURORA. *Eureka Sentinel*, Dec. 23: It is currently reported here that the Esrihardt & Aurora tunnel will close down all operations after to-morrow. The company's mill will probably be kept running on tailings for about 30 days. We regret to learn that work is to be stopped in the tunnel, at least until some crosscutting has been done to prospect for an ore body. However, we hope the stoppage of work will only be temporary. An extensive ore body will be found in the mine at some future day.

**ARIZONA.**—TOMBSTONE. *Arizona Citizen*, Dec. 25: There have been no important strikes in any of them during the past week, except the Sunset; but they have all been steadily increasing in body and richness, but not to enough extent to make an important strike. The Sunset, in shaft No. 2, at the depth of 100 ft., struck a large body of ore which assays well. The Graham is looking better than it ever has, and they are now sinking on as good a body of ore as has ever been struck in camp. They are now down about 100 ft. Mr. Billick is still sinking on his Allen street shaft of the Mountain Maid, and there is every indication of striking a large body of ore before they go many ft. deeper. On the Tough Nut they are placing the machinery in the new hoisting works house, and are now down about 145 ft.

**ARIZONA.**—Arizaca things begin to look as if business of importance would be transacted before long, several fine-looking properties having been bonded to Eastern capitalists, and one or two sales made, the consideration being snug little sums. Developments have been going on quietly, and several claims, considered poor properties 2 or 3 months ago, are turning out to be very valuable claims, and held at good figures by the lucky owners. At the Con. Arizona mill and mine work is being pushed vigorously. The mill is expected to be started up by January next. For 14 days past the "Longarina" mine has kept the Derre mill busy crushing its ore. From the Plo-moss mine, near Silver Hill, some very fine ore is extracted. In Oro Blanco Supt. Kirkpatrick, of the Orion Co., is pushing his mill towards completion, and before long he also will send his stream of bullion from ore extracted from the Warsaw and other claims belonging to the company. In the same district the Arizona Prospecting Co., under the direction of Supt. A. N. Noon, are doing some work on several of their valuable claims. In the Sierritas, Mr. Jack Mahall is hauling out some splendid ore, which assays very well.

**SANTA RITAS.**—The Goldtree mine has a 50-ft shaft and about 120 tons of ore on the dump, which shows mostly soft metal, chloride and galena. The Gambrinus and Georgia mines, developed with an 80-ft shaft, show a true vein of from 20 to 30 ft. in width. The Christmas Present, by open cuts, shows a 30-ft ledge of galena, horn silver, carbonates and chlorides. The Aztec No. 3 mine has a shaft 75 ft. in depth, showing a ledge of from 5 to 7 ft. wide. The Lost mine has a 100-ft shaft, with a 2-ft ledge. The Red Cloud has 3 shafts respectively, 63 ft., 45 ft. and 15 ft.; these shafts show a ledge from 18 inches to 5 ft. of chloride, patanka (black metal) and native silver. The Break of Day mine has a 16-ft shaft, showing a 3-ft vein. The Thunder mine has a 20-ft shaft with open cut, showing an 8 ft vein of chloride and galena. The Birthday and Evening Star mines have large croppings which show a 30-ft ledge. The Nonpareil, on the upper slope of the Goldtree mountains, an extension of the Goldtree mine, shows a very rich ledge of chloride ore. The Miners' shows in the 2 shafts now sunk a good body and well-defined ledge of rich chloride and patanka. The Grampus, on the upper slope of the Gambrinus mountains, has a very fine body of smelting ore.

The Devil's Cache mine has a 60-ft shaft and an open cut, showing a ledge 30 inches wide, carrying 23% lead, 30% copper and \$726 per ton in silver. Good practical miners and business men are needed in the camp, for some men have done more harm by their reports, bad management and work, than can be repaired in a year of good, honest labor, which has disappointed investors. The mines are there, but it requires more than one week to see them, all and to do justice to them.

**COLORADO.**—EMPIRE. *Colorado Miner*, Dec. 25: At this point there is considerable activity. They are starting up the South Legion and shipping from 2 to 3 wagon loads of ore per day to the Stephens mill for concentration. The ore runs 5 ounces in gold per ton, and \$30 silver. Mr. Woodruff, who has recently arrived from St. Louis, is fitting up the Candee mill by putting in concentrating machinery, which will greatly benefit the camp. Edward Freeman has started up work on 2 of his lodes—Great Eastern and Rising Sun. The surface quartz on the former carries gold \$100 per ton, and the latter is carrying 10 stamps daily, and with good results. Capt. Thomas Baird will soon start up work on the Silver Mountain. All parties owning property here are having more faith than ever, and the consequence is a large amount of work is being done, and Empire is pushing to the front again.

**KELLY MOUNTAIN.**—The Lincoln lode, owned by Major E. S. Platt, and opened by an adit near the wagon road at Spanish bar, is again being worked. The ore is a gray and iron pyrites. A crosscut on the vein recently encountered a vein of ore 1 ft. in width. Six men are at work on the Donaldson lode. Six tons of ore were shipped about a week ago, giving for first-class \$223 per ton, and something over \$100 for second-class. The first-class carried 10 ounces of gold per ton, the remainder of the value being in the silver. Work was resumed this week on the Champion lode, which is owned by New York parties, and superintended by Thomas Cooper, of Idaho Springs. The Cusaco Con. is owned by the Citizens Republic lode, owned by Messrs. Morris, Wayne and P. R. Stanhope, carries native silver in the shaft, which is now 50 ft. deep. The Little Metta is on the same vein as the latter. Gov. Bryan purchased a controlling interest in the property, and has also purchased 3 other claims on Chicago creek. The Little Etta tunnel company owns about a dozen lodes, some of which will be vigorously worked at the commencement of the new year.

**HURKLE MOUNTAIN.**—The Fairmount-Schaffer is now superintended by John McCuen. There is a large body of ore in sight in several places, and a force of men, principally contractors, are opening up the mine in good shape. The ore is principally iron and copper pyrites with black oxide of copper, carrying gold, silver and copper. The Dominion lode is the property of the Dominion mining and smelting company, L. A. Gilman, Superintendent. A dividend capital is provided for the development of the property, which has been shipping ore for many months past. The Maud Munroe lies but a short distance from the Dominion. It is owned by Messrs. Elliott, Munroe, Miller and Barber, who are sinking a shaft on about 1 ft. of ore that runs over \$100 per ton.

**SEATON HILL.**—The Tropic is the most prominent mine on Seaton mountain. The main shaft is now about 225 ft. deep, and there are about 100 tons of ore now awaiting shipment, about 60 tons of which is first-class and the remainder concentrating. It is estimated that the mine is clearing about \$6,000 per month with a force of 37 men. The Gem mine, lying a short distance above the Tropic, is owned by E. K. Stinson & Co., and has a shaft 200 ft. deep. Ten men are now at work. The vein is leached by Messrs. Gilson, Rane, who have recently run a crosscut to the lode and found a vein of ore 1 ft. thick, carrying gray copper and running as high as \$500 to \$600 in gold and silver. The Metropolitan, owned by Hagland & Co., is one of the steady producers on Seaton mountain. It possesses considerable development and is continuously worked by its owners. The ore often consists largely of galena, but runs well in both gray and silver. The first-class mine runs 20 to 250 lb. in gold per ton, and carries a large percentage of copper. This property is on the line of the Idaho tunnel.

## IDAHO.

**IMPORTANT SALE.**—Yankee *For Herald*, Dec. 20: The sale of the Ana mine, on Ouster mountain, has been consummated. It was the property of Mr. Jerome Colvin and James Viar, who got \$20,000 for it. The Ana is one of the best mines in the Yankee Fork district, and the price at which it was sold is low. The company that bought it is composed of Salt Lake men.

**BOISE COUNTY.**—I have, in former letters, neglected to speak of one of the most important mining enterprises, or set of enterprises, on this side of the basin—the gravel drifting claims of Gold Hill, near this city. Six companies are at work—3 white and 3 Chinese. The gravel lies between the bedrock and a hard formation of clay, the average depth of the pay dirt being 6 ft. These claims usually give employment to about 100 men—though hardly that number are at work at present—and are operated the year-round. The combined yield of these claims is estimated at between \$150,000 and \$200,000 annually. Work is going on in the Rising Sun mine and one or two others on Shaw's mountain. A general resumption of operations at that camp will doubtless take place in the spring. The Elmina Co.'s tunnel on the Crown Point, at Bannock, is now in over 100 ft., and if the contractors keep up their rate of speed they will have it completed earlier than was anticipated by us outsiders.

**YANKEE FORK.**—Mr. T. R. Butler, Supt. of the Custer mine, Yankee Fork, has been interviewed by a reporter of the Salt Lake *Tribune* concerning the Yankee Fork mine and Custer mill. Speaking of the mines of that region, he said half enough has not been written about them. In fact there are no mine owners up there who have axes to grind; they have good properties and are well satisfied. The developments during the past year have shown up strong veins and rich ores. The mines on East's mountain and along Jordan creek are looking well, while the outlook on the Custer mountain exceeds the expectations of the most sanguine. The 20-stamp mill on the Custer property had been started before Mr. Butler left, and it is said to be one of the nearest mills of the kind on the coast. The shaft of the mill is 117x100; ore here, 47x30 ft., capable of holding 1,000 tons. The engine is a Harris-Corlies, 13x45, indicating horse power, 175. There are 3 boilers, 10 ft. long by 54 inches, steel shelves, etc.; an 18-ft revolving drier. The chloridizer used is like the Bruckner without the diaphragm, its length is 18 ft. over all, and diameter is 6 ft. The water system around the works is very complete. A pressure has been secured of 70 lbs to the square inch. The ore is sent down from the mine by means of a suspended wire tramway (Haldane's patent). The rope is 6,500 ft. long, the direct length of the tramway being 3,200 ft. The capacity of the tramway is 30 tons in 24 hours. Next summer there will be at least one more mill on the Yankee Fork.

## MONTANA.

**THE MOUTON.**—Butte *Miner*, Dec. 23: Very satisfactory progress is being made at the Mouton works. The 3 shifts of men employed in sinking the shaft are making excellent progress, and a depth of 25 ft has been attained, the eighth set of timbers being put in yesterday. The frame work for the hoisting works is being prepared as expeditiously as possible, and their erection will begin at the earliest practicable moment.

**THE MOUTON.**—The old shaft is being sunk night and day, and has attained a depth of 170 ft. The new shaft also is being vigorously prosecuted, the men now working 100 ft from surface. The two were connected several weeks ago by the 70-ft level. The 70-ft drift, running west from the new shaft, is yielding a considerable amount of ore of excellent grade. The ore lies on the foot wall, the vein dipping south, and is nearly 2 ft wide.

**THE MOUTON.**—Drifts east and west on the vein have been started from the north crosscut and have been extended about 12 ft in each direction. On the south of the main vein a drift has been started east, the face of which is now in 12 ft from the crosscut. These drifts have been started with a view to prospect the ledge more than for the immediate extraction of ore. The pump is kept in almost continuous operation, and it is not unlikely that a new pump of increased capacity will have to be placed in position.

**STEVENS.**—The foot and hanging wall strata of ore in the new shaft are enlarging with the attainment of depth, the former now being 2 ft and the latter 20 inches in width. The quality of the ore is also improving and is not mixed with worthless matter. The "horse" noticed in previous reports gives evidence of taking its leave.

**SNOOZER.**—This, as yet, is a mere prospect, located near Centerville, most of which has been taken in by the patent. It is owned by McNamara, Devlin, et al., and is developed by a shaft 30 ft deep, sunk just south of discovery. The vein in the bottom is several ft. in width, and though not of high grade the owners are confident of an improvement with depth.

## NEW MEXICO.

**MAQUALENA MINE.**—*Cor. News and Press*, Dec. 16: I have been here 10 days looking over the mines, and I find some very large bodies of carbonate of lead ores that average from 5 to 25 ounces of silver to the ton, and from 10% to 60% of lead. The veins are from 10 to 60 ft wide, and lie between lime and porphyry. There has been very little work done on any of them, and the small amount of ore mined was smelted in an old-fashioned furnace that was put up here a long time ago. Properties are not held at high figures, and there are many chances for profitable investments. The mines are 30 miles from Socorro, and the weather is warm and pleasant all the year round, there being no snow.

**PLUMAS.**—Among the many resources of Colfax county, perhaps none has attracted so little attention as the immense beds of graphite, or plumbago, that are found in the foothills along the Canadian river and some of its tributaries. Plumbago has been found cropping at the surface in 4 or 5 localities quite distant from each other, in beds from 3 to 5 ft in thickness. The specimens taken from the different outcrops show in mass a fine, smooth texture, free from grit and apparently of excellent quality, though of this we cannot speak with certainty, as is chemical analysis of it has not yet been made. Many fine crystals are found, both hexagonal prisms and plates. The value of large beds of graphite of good quality so near the railroad must be very great, and it might well pay capitalists to examine this district.

## OREGON.

**FROM SILVER CREEK.**—*Sentinel*, Dec. 22: Mr. Thomas F. Rogers, of Silver creek, in Josephine county, called on us last week and showed us some very handsome gold recently taken out of his mining claim on that creek. The specimens are heavy smooth gold, such as is called "lead" gold by miners, as it is thought to indicate a lead or continued pay streak, and weighing from \$1 to \$4. A nugget was taken out of a few weeks since weighing \$31, and Rogers says half-ounce pieces are quite common. He estimates the average wages of the miners at \$5 per day, and says that only about 3 will remain in the camp during the winter, the snow being already 2 1/2 ft deep.

## UTAH.

**SILVER REEF DISTRICT.**—*Miner*, Dec. 22: The Richmond steam engine, which was ordered by the Barbee & Walker last week, has been set up in the west end of the hoisting works, and Monday morning steam was turned on for the first time. The machinery worked splendidly, and the specimen of Wad turned out was pronounced by Foreman Gamble to be A No. 1 quality. Pipe is now being laid down the main incline, and the first operations of the new drill will be at the bottom station.

**STRACK & SRA.**—Salt Lake *Tribune*, Dec. 20: The Harrisburg Hill company, whose properties all lie close together in Star district, has been, for some time back, looked upon as very promising. The company renewed work upon the Kamaarrah and made a strike of a 4-ft vein of rich ore. A letter just received from the mine reports as follows: "I am still at work on the Kamaarrah. It is looking splendid, and the ore is of high grade. I have taken out 50 tons of ore, and lots of it in sight in the mine. I am taking out about 5 tons a day on an average. I have made 3 assays, each of different qualities of the ore. One sample went 606 ounces silver per ton, and lots of the same kind in the mine and on the dump."

### The Abomination at our Doors.

It is currently reported that there are now being large quantities of oleomargarine brought into this city from the Eastern manufacturers, and the counterfeit is now being sold as butter to unsuspecting people. The late scarcity and consequent high price of butter has afforded the avaricious dealers just the opportunity they desire to reap large gains from the sale of this cheap and dangerous material at a high price. Such success has been attained by the makers in giving this compound of tallow, sour milk and coloring matter such a semblance to butter that those who are unused to the finest product of the churn are deceived, and consequently imposed upon. It is easy to see that thus filling the demand for a common grade of butter with oleomargarine, the market for the legitimate product will be seriously interfered with, and the rewards of honest producers much reduced. Thus our dairy interest is assailed, and unless something is done to warn the consumer of the fraud practiced upon him, much money, which should go to building up our true dairy enterprises, will be turned aside into the pockets of the tallow churners.

It is a shame that this foul stuff should be brought into so fine a dairy State as California. It is an outrage that innocent eaters should be subjected to the menace to their health which this pernicious material is shown to embody. But it will do very little good to merely declaim against the evil; the greed of dealers is proof against exhortations. It is a sad reflection that it is quite probable that commission houses which have reached wealth by the money made out of the true products which have been consigned to them, should now turn against the producers who have made them rich, and sell in competition with their patrons' product this Eastern abomination. We do not know what is the case in this city, for we have not yet ascertained who is handling the false butter; but experience in New York has shown that such dealers were not slow to play the traitor to the true interest by dabbling in the false, which yielded them great profits.

It is plain that something must be done about this new evil or our butter makers will experience a much greater depression of values than they have had hitherto, and that they could not stand without failure. There seems but one thing to do, and that we learn from Eastern experiences. It is not practicable to prohibit the manufacture and sale of the material, but it is practicable to order that it be sold under its own name and not as butter. This much the law will do a great deal to repress the evil, for, if every package is indelibly branded and if every retail dealer is forced to put a label upon every piece he sells, no matter how small, then no one will buy oleomargarine without knowing what he is purchasing. With this much assured it devolves upon the public press to inform their readers just what oleomargarine is, and this exposure of its nature and composition will go far to repress its sale.

We are not sure whether the general law against adulteration of foods, etc., in this State, would adequately meet the case of oleomargarine or not. Probably it would not, for other States have had general anti-adulteration acts, and yet have adopted special acts to meet this special form of evil. No time should be lost in protecting our butter interest in this regard. The Legislature will soon meet, and the relief should be had at once. In order that all our readers may see the nature of the act adopted in New York State, we append a full copy of it as follows:

An Act for the protection of dairymen, and to prevent deception in sales of butter.

The people of the State of New York, represented in Senate and Assembly, do enact as follows:

SECTION 1. Every person who shall manufacture for sale, or who shall offer or expose for sale, any article or substance in semblance of butter not the legitimate product of the dairy, and not made exclusively of milk or cream, but into which the oil or fat of animals not produced from milk, enters as a component part, or into which melted butter, or any oil thereof, has been introduced to take the place of cream, shall distinctly and durably stamp, brand, or mark upon every tub, firkin, box or package of such article or substance the word "Oleo-Margarine," and in case of retail sale of such article or substance in casks, the seller shall, in all cases, deliver therewith to the purchaser, a written or printed label bearing the plainly written or printed word "Margarine." And every sale of such article or substance not so stamped, branded, marked, or labeled, is declared to be unlawful, and no action shall be maintained in any of the courts of this State to recover upon any contract for the sale of any such article or substance not so stamped, branded, marked, or labeled.

Sec. 2. Every person who shall knowingly sell, or offer to sell, or have in his or her possession with intent to sell, contrary to the provisions of this Act, any of the said article or substance required by the first section of this Act to be stamped, marked, or labeled as therein stated, not so stamped, marked, or labeled, or in case of retail sale without delivery of a label required by Sec. 1 of this Act, shall, for each such offense forfeit and pay a fine of one hundred dollars, to be recovered with costs in any of the courts of this State, having cognizance thereof, in an action to be prosecuted by the district attorney, in the name of the people, and the one-half of such recovery shall be paid to the informer, and the residue shall be applied to the support of the poor in the county where such recovery is had.

Sec. 3. Every person who shall knowingly sell, or offer or expose for sale, or who shall cause or procure to be sold or offered or exposed for sale, any article or substance required by Sec. 1 of this Act to be marked, branded, stamped, or labeled, not so marked, branded, stamped, or labeled, shall be guilty of a misdemeanor, and on trial for such misdemeanor proof of the sale or offer or exposure alleged, shall be presumptive evidence of knowledge of the character of the article so sold or offered, and that the same was not marked, branded, stamped, or labeled as required by this Act.

In what manner best to enforce this matter upon the attention of legislators does not clearly appear. In all the dairy States of the East

they have dairymen associations, which easily secure the relief by the force of their organization. Their committees bring the evil and this evidence before the Legislature committees, and acts are quickly put through. In this State the dairymen have no organization. One was attempted a few years ago, but no interest was awakened and it died. Now, as there is no central organization to work through, it is probable that meetings of butter producers in the different counties, the proceedings of which could be transmitted to the local representatives, would awaken them to the action needed of them. It is certain that if the evil is allowed to creep in quietly and without arousing the opposition of those whose industry is menaced, it is all that the oleomargarine dealers could ask. There must be agitation of the subject to warn the people and to secure a remedy. There is no time to lose. It is said that about 10,000 lbs. of the counterfeit was brought into this city during 10 days. It is easy to see what will follow if this nefarious traffic is allowed to go unchecked.—*Rural Press*.

### Gold from Sulphurets.

The Greenville (Plumas Co.) *Bulletin*, thus describes the new works of the Plumas National Company:

These works are now able to extract the gold from the sulphurets, of which this mine contains large amounts. The process they are now working is as follows:

The ore is first crushed in the six batteries (30 stamps) from which the pulp passes over silvered plates (where the free gold is caught) to the six Frue concentrators, one concentrator for each five stamps, which separate the sulphurets from the gangue. The sulphurets are then conveyed about 100 ft. to the furnace by a car on a covered tramway. They are then spread out on a drying floor that covers the dust chamber; after being thoroughly dried they are put in the Brunton revolving furnace and thoroughly desulphurized, which takes from eight to ten hours to roast a charge of three tons. They are then discharged on a cooling floor and dampened; then put into the chlorinating tube where the gold is dissolved by the action of chlorine gas, and from there drawn off into precipitation tube, and the gold recovered by precipitating.

The capacity of these works is from four to six tons a day, and as the company have a large quantity of sulphurets on hand, they can be run to their full capacity for a long time. The sulphurets from this mine assay from \$60 to over \$100 per ton, and the yield from this source, in addition to the amount obtained in free gold, will be very satisfactory. The mine is thoroughly opened and immense quantities of ore in sight, and there is no doubt that this will prove to be one of the leading mines in the State.

These works were erected under the immediate supervision of R. M. Wilson, the consulting engineer of the company, who has had a great deal of experience in practical mining operations in this State and Nevada.

This process is working successfully in Nevada, Amador and Tuolumne counties, in this State, but these are the first works of the kind erected in this section, and will be the means of largely increasing the gold productions of this county, as nearly all the quartz ledges carry sulphurets—some of them very rich—that heretofore have been lost.

**GOLD AT WEST POINT.**—A correspondent of the *Calaveras Chronicle*, writing from West Point, in that county, says: The progress of our mountain town still continues, although the capitalists are a little backward with their investments in our mines. We keep working along, developing to the best of our ability our own mineral resources, which, some day, will take rank among the foremost in the State. There are too many rich quartz ledges to be left idle if we stop. Therefore it behooves us to use a little exertion ourselves, or as the saying is, "Give up the ship." The true, prospectors are scarce in our vicinity, and so are means. But these prospectors that are left with us are commencing to develop our mines in a more substantial manner than formerly. Not having much means, they have to economize and take what machinery they can get to start with, which accounts for the slow development of mines. There are a great many men who have lived in West Point, and in fact worked in our mines, who are under the impression that the gold never goes down to any depth in our quartz veins, and I myself have been told some years ago that the gold gave out when it reached hard ground, which at the time I believed was the case, and like many others, never followed them far enough to find out. But in the course of time, the croppings were nearly all worked out and the only chance left, was to leave the place or follow them down. Many prospectors took the first part and left, while others, with myself, took the latter course and solved the problem, and found instead of the gold going down, it came up from below, either in the form of pockets or chimneys.

The army appropriation bill, which is nearly completed by the House sub-committee, will not differ materially from that of last year. It will make appropriations on a basis of an army of 25,000 men, and according to the present intention, will not propose any legislation for reduction or reorganization.

### The Wood River Country.

A correspondent of the *Idaho Statesman* gives the following intelligent description of the Wood River country, which is attracting considerable attention: Since my return to Boise City almost every one I have met has asked me the question "Is Wood River going to be a good camp?" How few they are even in our own Territory who realize the extent of territory embraced within the region throughout which the recent discoveries of silver ores have been made, and known by the general name of quite a volume to contain a minute description of the Wood River country. It would require of that entire region, but with your permission I will give the following glance at the general outlines of that vast extent of country. A personal observation of a great portion of the country embraced within its limits, leads me to believe that there are three distinct mineral belts, (perhaps four) running through the entire region, which for the sake of convenience I will confine to the discoveries made within the last two years; beginning at the southeast corner, here we find ourselves on the Blackfoot stage road, in what is known as the Dead Man's Flat, about 35 miles east of the town of Bellevue and on the margin of the lava beds which lie between the Snake river and the mountains.

Turning our face to the northwest we find a mineral belt from 3 to 8 miles in width, extending through the mountains in a northwesterly direction and easily traced for a distance of 60 miles, with fine lodes of galena and carbonate ores located and being developed every few miles for the entire distance. This belt, at the northern end, terminates in the Kinnickinick and Bay Horse districts of Upper Salmon river and contains many of the finest prospects in the country.

From this main mother belt there are branches on either side running off toward the Lost river on the east and Little Wood river on the west, near each of which streams there are some fine locations. West of this belt, and running parallel with it at a distance of about 20 miles, you find another belt which crosses Little Wood river about 10 miles above the stage road, and in its northern course it cuts the headwaters of the East Fork of the Big Wood river and crosses to the East Fork of Salmon river, some 20 miles east of Galena City and extending in the direction of Bonanza City. The Paymaster and some 10 or 12 other lodes on the East Fork of Big Wood river are on this belt, besides a number of very fine locations on the head of the East Fork of Salmon river. Much of this belt is yet unexplored.

Some 10 miles west of the last mentioned belt we find another mineral belt running parallel with those already mentioned, although not so well defined. There are several mines located on various portions of it near and a little east of Bellevue, also on the head of Indian Spring creek. The celebrated North Star mine, the Truant Boy, the Elk Horn and a number of other fine mines are on this belt. I do not know that it has been explored to any considerable extent north of Ketchum.

Travel still westward six or eight miles and we come to the group of mines around Jacob's City, where we find a mineral region several miles wide, extending through Bullion, Deer Creek, Greenhorn, Warm Spring creek, Galena City, and extending through the mountains in the direction of Bonanza City. Upon this belt are situated many of the best developed and richest mines in all this country. The Star, the Idahoan, the Bullion, the O K and many others are on the southern end of the belt, and the White Cloud, the Gladiator, the Eunice and others are near Galena City on the northern end.

Again travel 8 or 10 miles west, and you find still another belt, which is several miles wide, running in the same direction from the foothills north of Big Camas prairie, through the headwaters of the Smokies and through the Saw Tooth district. This belt, when thoroughly prospected, may prove to be one of the richest yet discovered. A number of very fine lodes of galena ore were discovered late this fall on the head of the Smokies, and as we follow it in its northern course we find the ore changes from galena and carbonates to sulphurets, bromides and chlorides. The Smiley mine, the Vienna, the Pilgrim, the Lucky Boy and many others are on this belt, the ore of many of which will yield from \$500 to \$5,000 per ton. True it will be seen that Wood River, if only "a camp," is quite an extensive one, covering an area of country nearly 60 miles square.

In describing these belts, your correspondent would not be understood as saying that there are continuous lodes of ore to be seen in all places on the belts, but that the formation is mineral bearing, and ledges are found in all of them at intervals of a few miles, and in many places good locations have been made within a very short distance of each other for miles along the belt. Some recent discoveries give reason to believe that there is still another belt west of those already discovered and running from Big Camas prairie through the mountains to the north, and that when fully developed it will prove to be a continuation of the great Atlanta mineral belt. Mr. A. Thompson, while surveying in this region only a few days since, found a large vein of gold and silver-bearing quartz similar to that of the Atlanta mine, and his party claim that there are many indications of a large mineral belt running in the direction of that place. If this proves true, it will make an

addition of some 30 miles to the width of our Wood River "camp." As to the richness and quantity of the ores, it will suffice to refer to the smelters at Salt Lake City, which are now receiving hundreds of tons of ore and giving returns of from \$100 to \$700 per ton. Besides there are thousands of tons of lower grade ore on the dumps and in sight in the mines which will pay well for reducing when smelters are erected within a reasonable distance of the mines.

### Drake District.

A correspondent of the *Bodie Free Press* gives a description of the Drake mining district, on Rough creek, Mono county. The district is situated seven miles from Bodie in a northeasterly direction, the mineral belt extending some five miles in length to two and a half in width. Rich croppings meet the eye in every direction. A wagon road has been built from the mines to the divide on the Bridgeport road, which makes it easy of access. Cottonwood creek, a stream running through the district and large enough to run a 20-stamp mill, is also another advantage to the camp. A mill site has been located, also a town site. A large number of prospectors are now engaged in their several claims doing work enough to hold them, and waiting for the inroads of capital to develop the mines.

Among the number of claims visited by your correspondent was the Pay Roll, a mine owned by Rodgers, Freer & Co. This company has run a tunnel into the hill some 65 ft., cutting a fine ledge showing free gold. Assays taken from this ledge show gold \$75; silver \$25.50. Following the ledge the company has sunk a shaft some 35 ft. in depth, the ledge widening as downward progress is made.

The Snow Storm, another mine owned and worked by B. F. Sanders of Bodie, but upon which little development has been made so far, shows a strong ledge two and a half ft. in width. Assays taken from this mine show gold \$45; silver \$15. This mine is in a very favorable location and only needs capital to develop it into a paying property. A number of mines equally as good as the above were visited, and I must say were capital to take hold of some of them Drake district would head the list of hullion producing sections.

**ALL ORES WILL BE REDUCED.**—We learn from the *Carson Appeal* that the ore reduction works which it is proposed to erect in Carson are not intended strictly for the treatment of melting ore, but for the reduction of ores of every class and character which cannot be profitably or successfully handled in the districts in which they are contained. Carson has cheap wood and plenty of water, and will soon have cheap railroad communication with the outlying mining districts. The works ought to be a success, and they will be if put in charge of a practical man. Put them under the control of a scientific individual and they will be a failure. A scientific metallurgist has never yet made a success in Nevada, but practical men who have had experience in smelting, leaching, chlorination and amalgamation have never failed. Science is a grand thing in the abstract; but, as applied to mining and ore reduction, it is a wretched failure in practice. We advise the Carson people to send to Eureka for their smelter, to Colorado for their leacher, to Austin for their chlorinator and to Virginia for their superintendent. But by all means let them give the Freibergers a cold shoulder. The Freibergers are some of them good miners; they know the constituents of ores and are competent mineral chemists, but they know as much about running mills and furnaces in this country as Bob Ingersoll knows about beaven.

**THE WALKER RIVER FURNACE.**—The melting furnace at the Walker River copper mines will be ready to go into operation in about three weeks. As yet there is no charcoal at the furnace. Coal is now being burned, however, and will be ready by the time the furnace is completed. There is in the vicinity an abundance of wood suitable for coal. Besides the rich veins of copper ore there are in the neighborhood many large ledges of silver-lead—argenteriferous galena. Also, there are good veins of gold-bearing quartz, and in conjunction with the copper in some veins are found nickel and cobalt. This is a very interesting mining region, and is destined to give employment to many miners when reached by the Carson and Colorado road, which will be in a very short time. In case the furnace about starting up shall prove a success, there will be erected. There is likely to be seen a smelting center—a place of many furnaces—somewhere in this region; probably on the shore of Walker lake. With cheap fuel for the furnaces there are whole mountains of copper ore that could be smelted. It would be worth millions to this region could lignite or any other coal that would coke be found near at hand.—*Virginia Enterprise*.

They have an expeditious way of paying off the employees on the Hudson River railroad. Last Thursday the paymaster went over the road, paying out \$150,000 in greenbacks and gold. The train ran at its highest speed, and the pay of flagmen between stations was put in envelopes attached to tickets, and was thrown at the various flagmen as their shanties were passed. In this way some \$15,000 was thrown from the pay car as the train was going at the rate of nearly a mile a minute.

## Montana Reduction Works.

A correspondent of the Salt Lake Tribune, writes from Wickes, Montana, as follows:

Twenty miles south of Helena, and four miles west of the Overland stage route, is located the new town of Wickes, that is destined to assume an important position among the prominent mining towns of the great West. Here the Alta Montana company transact their business of mining and reducing ores, and this company has already assumed such importance that a description of their mines and works will be of interest. After the discovery of the Alta mine, a company was formed in 1876, and the organization becoming perfected, work has since progressed in the erection of works and opening up their mines.

The works consist of the following machinery, very nicely located for doing just such work as is required. In a large stone and brick building there is in operation a full set of Krom's machinery for dry concentrating such ores as are best worked in that manner. The ore is taken in at the upper part of the mill which is set partly in the hill, and then falls by gravity, first into a large Blake crusher, then passes between a pair of Cornish rollers, in turn passing through another similar set of rollers below, thus being brought to that degree of fineness required for successful working by the separating machinery. This ore is then elevated to the top of the building from which it descends, through spouts, to the 24 Krom machines which take out the worthless silica and reduce the ore down to one-third or one-fourth the original bulk and at the same time separates the good ore into four different sizes and qualities. This separating or concentrating is done by air jets, and the dust is drawn up by suction pans and carried outside, thus making the works pleasant for the men to work in. The machinery is propelled by an engine of 100-horse power, and the concentration is done at a cost of less than \$2 per ton. The ores thus treated contain so much silica, that smelting would be expensive did they not first get rid of that silica by concentration. Just below the concentration works is located the smelter. When the present company took hold of the property the old smelter was much changed, and now they have in operation a water-jacket cupola capable of working 25 tons of ore per day. It is their custom to mix the ores of their various mines so as to get the best results at the least expense of fuel and labor, and such ores as do not readily yield to the smelter are treated in the battery of five stamps and in their rotary and reverberatory furnaces. The works are provided with three Bruckner revolving cylinders six ft. in diameter and 12 ft. long for chloridizing, two reverberatory furnaces, 13 by 69 ft., and one 9 by 44 ft., and they also have a refining furnace for separating lead from silver, and two amalgamating pans and all other necessities for complete silver reduction works to treat ores by smelting and by amalgamating, and they are now putting up four more which will be each 11 by 40 ft. The works are now turning out five car loads of bullion per week, which bullion runs 360 ounces silver and \$85 in gold per ton, making each car load worth from \$3,000 to \$6,000. But in a few days this output will be greatly increased, in fact, more than doubled by the completion of the new smelter adjoining, with its water-jacket stack capable of working 40 tons of ore per day, and with its other auxiliary machinery.

After we had looked at such complete works and seen the rich yield, the question naturally comes, "Whence comes all these ores?" At a distance of one and a fourth miles we reach the Alta mine. We find the vein varying in thickness from 4 up to 15 ft. of pay ore, embracing galena, carbonate and chloride, that assays on an average 60 ounces of silver per ton. The vein has been opened on the surface and underground a distance of 1,000 ft. The ores are carried by a tramway down the mountain side to a point near the reduction works. The Comet is the farthest away from the works of any of the mines owned by the company, being distant four and a half miles, has more galena with carbonates, and the vein ranges from 6 to 18 ft. in width—assaying from 40 to 125 ounces in silver. The mine has 1,100 ft. of tunnel, and large water concentrating works are being put in of the Frayer & Chalmers pattern, capable of reducing 25 tons of ore per day. This will make the entire product of the mine available and do away with hand sorting.

The Northern Pacific is another good mine owned by this company, upon which 1,000 ft. of tunnels have been run.

The Custer is a new mine of high grade, and well-defined ledge, some of the ore going as high as 400 ounces silver. Besides their own mines the company has lately issued a price list to try the ores mined by other parties, and now the miners have a home market that will induce steady development of the numerous mines located in all directions near Wickes. The works are located in the center of a large and rich mineral district, and will grow in importance as the mines are opened up. The company had trouble to get iron ore to use in fluxing, so they let their want be known and in a short time they were flooded with rich specimens lying almost at their door. The cost of delivering ores from the mines to the works, range from 90 cents to \$3 per ton, and with new facilities, even these low figures will be somewhat reduced.

## USEFUL INFORMATION.

**VINEGAR.**—A method employed in France, which converts cider or other liquid into vinegar much more expeditiously than do ordinary practices, prefaces the process with preparing the barrels or casks by first scalding them with water and next pouring into them boiling vinegar, rolling the barrels, and allowing them to stand on their sides two or three days, until they become thoroughly saturated with the vinegar. This preparation over, the barrels are filled about one-third full with strong, pure cider vinegar and two gallons of cider. Every eighth day thereafter two gallons of cider are added until the barrel is two-thirds full. In 14 days after the last two gallons are added the whole will have been converted into vinegar, one-half of which is now drawn off and the process of filling with cider begun again. In summer the barrels during the process of conversion are exposed to the rays of the sun, and in cold weather are stored where a uniform temperature of about 80° can be maintained.

**UTILIZING VULCANIZED RUBBER.**—The utilization of old vulcanized caoutchouc is effected by Heyer, of Berlin, in the following way: Old used-up buffer-rings of railway carriages are heated, in presence of steam; the sulphur distills off, the caoutchouc melts and flows in hot water, collecting at the bottom of the vessel. The steam prevents burning of the material. The melted caoutchouc has essentially different properties from what has been supposed. It becomes a pretty thin, dark mass which remains liquid even at ordinary temperature, soon dries in air, and retains its property of being water-tight. On the other hand, it parts with its elasticity, at least for large pieces. Heyer uses this liquid caoutchouc chiefly for making water-tight coverings for road or railway carriages, awnings for ships, etc. It is recommended also as a water-tight varnish for iron wares.

**GLYCERINE AS AN ILLUMINANT.**—Pure glycerine, it is said, may be burned in lamps, provided the wick is so arranged that it shall not be elevated above the surface of the liquid, as the viscosity of the substance will not permit of its being fed upwards by capillary attraction. The flame of glycerine, like that of alcohol, is almost colorless. Glycerine, however, is easily mixable with a variety of substances that will impart luminosity to the flame, and a number of substances rich in carbon may be added to it for that purpose. It is not improbable that circumstances might arise where these facts would be useful.

**IMPROVED MORTAR AND ARTIFICIAL STONES.** M. Decourneau attributes the cracks in common mortars and cements to the uncombined quicklime that they contain. In order to neutralize the lime, he uses an *agregat* composed of a very fine silicious powder, mixed with diluted nitric acid. He thus obtains mortar with much greater, more uniform and more lasting resistance than those hitherto used. The application of his method, especially in the new forts of Paris, has given excellent results, without a single failure. Stones made by his process may be sawed and chiselled like natural stone.

**HOW TO USE OIL-STONES.**—Instead of oil, which thickens and makes the stones dirty, a mixture of glycerine and alcohol is used by many. The proportions of the mixture vary according to the instrument operated upon. An article with a large surface, a razor, for instance, sharpens best with a limpid liquid, as three parts of glycerine to one of alcohol. For a grinding tool, the cutting surface of which is very small, as is also the pressure exercised on the stone in sharpening, it is necessary to employ glycerine almost pure, with but two or three drops of alcohol.

**JAPANESE HAND SAWS** cut on the pull stroke, so that no matter how hard the wood or dull the saw, they will not bend or huckle. It is rather more difficult to saw to line with such saws than with ours, but they have their advantages. Take a key-hole or compass saw, cutting on the push or shove stroke—what an aggravating, awkward thing it is! Now point the teeth the other way, and you have a tool that will keep stiff no matter how many knots it encounters or how dull it gets. In other words, the pull-stroke of 3,000 years ago is the best for thin narrow blades.

**UTILIZING RIVER CURRENTS.**—In parts of Germany it was usual to anchor boats in river currents, with large paddle wheels to be turned by these currents and used in grinding corn, but with this cheap power there was an inconvenience in conveying the corn to and from the boats. It is now proposed to re-adopt these old floating mills for the driving of dynamo-electric machines from which light or power may be transmitted to the shore.

**TO MEASURE A COIL OF BELTING.**—Add the diameter of the hole, in inches, to the outside diameter of the roll; multiply by the number of coils in the roll; then multiply this by the decimal .1309, and the product is the number of ft. in the roll. To have the exact length, the average diameter is to be used if the roll is not perfectly round, and the fractional parts of an inch must not be omitted in the calculation.

**TANNING.**—A process of improved tanning for the improved treatment of leather, is described in the technical journals. It appears in this process iron salts were originally resorted to, but no practically successful results could be obtained with it, the iron salts being found to attack the leather fiber, destroying its durability. The addition of chrome was found to be a great improvement, but the chrome and salts became partially dissolved by moisture, thus rendering it necessary to protect, by an absolutely non-soluble coating, the fibers of the leather. This end was at last attained by producing an iron and chrome soap, and it is by using this compound in a manner adapted to the purpose in view that the material is prepared, the appearance being that of ordinary leather, though somewhat lighter than bark-tanned hides. Some experiments are reported to test the value of the article produced by this method, the results proving very satisfactory; that is, the tensile-breaking strength of several specimens was found to average some 4,550 lbs. per square inch, which is about equal to that of good bark-tanned leather, the improved fabric also showing a remarkable resistance to the absorption of water.

A WRITER in the Providence Journal predicts a useful future for the milkweed, which has heretofore been considered only a cumber of the ground. Its seeds yield a finer oil than linseed; its gum can be used in place of India rubber, and from its floss a fabric resembling Irish poplin has been made; while the young shoots are used in the spring by some people instead of asparagus, which they resemble in flavor. Now, pertinently adds the writer, if uses can be discovered for the thistle and white-weed, they may prove friends in disguise.

**TO PREVENT SOOT FROM ACCUMULATING.**—The *American Builder* says the accumulation of soot may be prevented by putting a quantity of salt into the mortar with which the intercourses of brick are to be laid. Then there will never be any accumulation of soot in that chimney. The philosophy of it is thus stated: The salt in that portion of the mortar which is exposed, absorbs moisture from the atmosphere every damp day. The soot thus becoming damp falls into the fire-place.

**RHUBARB TEST PAPER.**—M. Lacour has invented a new test paper. He adds to powdered rhubarb twice its weight of liquid ammonia, and after maceration for a quarter of an hour filters the liquid. Strips of paper dipped into it are dried, and are of a red purple color. These, when touched with acids become of a lemon yellow, and with alkalis their former color. It is said to be a very sensitive test.

## GOOD HEALTH.

## Consumption.

Consumption usually begins with a slight, dry cough in the morning, then, on going to bed, getting more and more frequent, with more and more phlegm, increasing debility, thinness of flesh, shortness of breath, and quickening pulse. In fatal cases its average course is about two years; hence the importance of arresting the disease at as early a stage as possible, and the sooner rational means are employed for this purpose, the greater the chances of success.

The disease is owing to an irritation commencing in the throat and extending to the lungs, so that their action is interfered with, and the blood does not receive sufficient oxygen to purify it. The first thing to be done is to remove the obstruction, which is the irritation or congestion of the lungs. Four ounces of glycerine, two ounces of alcohol, two ounces of water and one grain of morphia make an excellent mixture for relieving the cough. It should be taken in doses of two teaspoonfuls every two hours until the cough is relieved.

The chest, just below the neck, should be rubbed with tartar-emetic ointment every morning over a space as large as the hand, until a thick crop of sores is brought out; then rub the ointment between the sores to bring out a new crop. Meantime the patient should take regular and vigorous exercise in the open air. There is nothing that equals horseback riding as a remedy for this disease. If a consumptive were to "live in the saddle," and sleep out of doors, taking care to keep the feet dry and warm, and to live upon good, nourishing food; in short, to "rough it," he would recover his health in a few months, even if the disease had made considerable progress. The trouble is that it requires a strong will to carry out so severe a course, in spite of the languor and debility which disposes an invalid to quiet dependency.

The most marked sign of lung disease is emaciation; and the most positive indication of returning health is increase in weight.—*Hall's Journal of Health.*

**SIMPLE SURGERY.**—A simple and usually successful mode of extracting a needle or any piece of steel or iron that has broken off in the flesh is by applying a common pocket magnet. Iron filings have a way of imbedding themselves in the eye which defies almost every ordinary means for their extraction. For their removal a small, blunt-pointed bar of steel, well magnetized, will be found effectual.

## Colds.

A cold in the head can usually be cured in a few hours if, as soon as discovered, the person will sniff the fumes of ammonia or spirits of camphor every few minutes as strong as they can be borne. When a severe cold attacks the throat and lungs, there is no safety in neglecting it for an hour, for there is more or less inflammation of the lungs, which interferes with their action, rendering them liable at any moment to take on serious and, possibly uncontrollable disease. Go home and remain there. In the evening take a warm foot bath, and at bed time take three or four liver pills. These will stimulate the liver to healthy action, and promptly relieve the lung trouble; but it renders the system sensitive to renewed attacks, and, therefore, the greatest care should be observed for several days not to take fresh colds. Ordinarily, no other treatment is necessary; but, should the cough continue, have your druggist make the following mixture, and take one or two teaspoonfuls every four hours till cured: Glycerine, 4 ounces; whisky, 4 ounces; morphia, 1 grain. Sore throat can be promptly relieved by applying a mustard plaster, or "mustard leaves," on the front of the neck, over the sore spot. In addition the throat and mouth may be frequently gargled with the following mixture:

A teaspoonful of salt, a pinch of red pepper and a tablespoonful of vinegar. If found too strong add a little water. A portion of the gargle may be swallowed, or sipped, little at a time.

Sweating has been quite generally recommended in the cure of colds. I think, however, that the risk of taking cold afterward will more than counterbalance the good that may be expected, and, except in cases of unusual severity, I would not recommend it.

The "Turkish bath" has been highly recommended as a cure for colds. With proper care afterward, there is no hotter or more effectual plan of cutting short a severe cold. It is not, however, necessary to go to a regular establishment to take such a bath. Any small comfortable room, where a good fire can be quickly made, will answer the purpose. In the early evening make a good fire in the stove and close the doors and windows, leaving only small openings for ventilation. Then let the patient put on his night clothes and lie down on a bed or sofa, or sit in an easy chair for an hour or more, with the temperature of the room from 90° to 100° F. Afterward the room should be gradually cooled to about 70°, and the patient should go to bed and remain there till morning.—*Hall's Journal of Health.*

## Night Air.

An extraordinary fallacy is the dread of night air. What air can we breathe at night but night air? The choice is between pure night air from without and foul air from within. Most people prefer the latter—an unaccountable choice. What will they say if it is proved to be true that fully one-half of all the diseases we suffer from are occasioned by people sleeping with their windows shut? An opened window most nights in the year, can never hurt any one. This is not to say that light is not necessary for recovery. In great cities night air is often the best and purest air to be had in 24 hours. I could better understand shutting the windows in town during the day than the night, for the sake of the sick. The absence of smoke, the quiet, all tend to make night the best time for airing the patient.

One of our highest medical authorities on consumption and climate has told me that the air in London is never so good as after 10 o'clock at night. Always air your room then from the outside air if possible. Windows are made to open, doors are made to shut; a truth which seems extremely difficult of apprehension. Every room must be aired from without, every passage from within. But the fewer passages there are in a hospital the better.—*Florence Nightingale.*

**DANGER FROM DISUSED HOUSES.**—Houses that have been empty may become fever breeders when they come to be reoccupied. An English sanitary officer alleges that he has observed typhoid, diphtheria, or other zymotic affections to arise under these circumstances. The cause is supposed to be in the disuse of cisterns, pipes and drains, the processes of putrefaction going on in the impure air in them, the unobstructed access of this air to the house, while the closure of windows and doors effectually shuts out fresh air. Persons moving from the city to their country homes for the summer should see that the drains and pipes are in perfect order, that the cellars and cisterns are cleared of rubbish, and the whole house thoroughly aired before occupying. Carbolic acid used freely in the cellar is a good and cheap disinfectant.

**ANTIDOTE TO POISON.**—If a person swallows any poison whatever, or has fallen into convulsions from having overloaded the stomach, an instantaneous remedy, most efficient and applicable in a large number of cases, is a heaping teaspoonful of common salt and as much ground mustard, stirred rapidly in a teacupful of water, warm or cold, and swallowed instantly. It is scarcely down before it begins to come up, bringing with it the remaining contents of the stomach; and lest there be any remnant of the poison, however small, let the white of an egg or a teaspoonful of strong coffee be swallowed as soon as the stomach is quiet, because these very common articles nullify a large number of poisons.

## The Week.

We begin Vol. XLII of the MINING AND SCIENTIFIC PRESS this week, and we want all our readers to notice it, as it is a fitting time for the renewal of subscriptions. The PRESS will be very much improved this year and no one will regret in assisting us in our good work.

The very copious and general rains are indications of a good and prosperous year for California. The hydraulic miners are all happy and even if the farmers have a little too much water for the present it is better than not enough.

In mining news the most noticeable feature is the closing down of the Eberhardt and Aurora tunnel, at White Pine. Hamilton is a deserted camp. The workmen have been all discharged from the tunnel in which nothing was found though so much was explored. The Eureka Sentinel, in speaking of the abandonment, says: "We are told that the magnificent two-story brick Court-house can be rented by just 'paying the taxes on it.' Who can tell but that some hang-on-a-tive 'cuss' will continue to pick around, develop the ground of all White Pine's glory, and that the town may yet become the leading city of eastern Nevada?"

Among other things a rich strike in a new ore body has been made in the Placerville gold quartz mine, El Dorado county. This mine was formerly the Pacific, and has been owned by an English company for some three years past.

The prevailing topic is the coming of the New Year and it is certain that the State was never in better heart and courage for it. Confidence in future prosperity is general. We hear from the East continued wallings from the croakers who have left us to try their arts on Eastern victims. They say the State is being ruined and they transfer their immense wealth to other fields, where it will be better treated. We do not miss their money; we do not miss the men. Their reports belie the State, for though their day of subtle arts is over, the day of required industry and reward for legitimate enterprise is dawning bright. It will be a good New Year.

## Silver in Curious Places.

During a visit to the State Mining Bureau this week, Mr. Hanks showed us several pieces of unmistakable sedimentary rock, the memorandum upon which was as follows:

"Sedimentary rock found 478 ft. below surface at Redwood City, San Mateo Co., Cal. Said to contain silver. Presented by S. M. B. Haley, well-digger."

And sure enough this rock does contain silver, as this writer saw by means of a glass; little scales of pure silver. How it came there, is this mystery.

But while considering whether the metal had been put on the rock, or whether it grew there, our attention was attracted to a pile of pieces of sandstone lying on the table. Picking up some of the pieces, we saw broad scales of silver upon it. This came from Silver Reef, Utah, and the heat proof that there is silver in that, and that it "grew" there is, that silver bars are coming down, and that the Barbee & Walker and Stormont mines are paying dividends from this sandstone ore.

The Redwood City rock was found while digging a well, and was met with at the depth stated.

At the Bureau we were also shown some specimens of arguerite or native silver amalgam, prescribed recently by R. R. Clark, J. C. Culbreth and J. L. Crimp, who brought it from British Columbia. The district where it is found is in the vicinity of Vital and Mason creeks, in a wild, mountainous region, almost inaccessible, and wholly without roads. Prospecting for coarse gold in the bed of the creeks has proved profitable, although but few miners have gone in, owing to the two or three hundred miles of "packing" necessary. For some time particles of whitish metal have been found with the coarse gold in the pan, after washing, but owing to the ignorance of the prospectors it was always thrown away, as of no value. The above-named miners, who arrived in San Francisco a few days ago, brought specimens of the metal with them, and submitted them to the State Mineralogist for examination. Assays proved the specimens to correspond almost exactly to the "arguerite," found in the mines of Argueros, in Coquimbo, Chile, where it is the principal ore. These mines are enormously rich, and are the sole producers of this peculiar form of silver. In the first 15 years of exploration, the mines afforded 200,000 marks of silver. The arguerite found in the Chilean mines assays: Silver, 86.5; mercury, 13.5 parts to the hundred. The British Columbia specimens now on exhibition at the Mining Bureau assay as follows:

Mercury.....11.90  
Silver.....56.15  
Silicate.....45  
Total.....98.50

The specimens are flat in shape, ranging in size from a quarter of a dollar to the size of a half dime. The larger pieces weigh a quarter of an ounce or more. Mr. Hanks has quite a number of them.

The absence of free quicksilver or quicksilver ores in the waters of Vital and Manson creeks renders impossible the amalgamation of small particles of native silver into larger masses, consequently it is agreed that a deposit, or vein of the amalgamated silver must exist at some point further up the stream. The Planchas de la Plata mine of Arizona may have been formed in the same way. Indeed, many suppose it may have been formed from the Stonewall Jackson mine, as the silver must have come from some such source.

Dana's Mineralogy says "arguerite" occurs with cobalt bloom and a little sulphuret and chloride of silver. It is found in regular octahedrons; also in grains, small masses and dendrites. In color, luster and ductility it is like native silver, only much softer. This ore has never before been found but in one other place in the world.

**COINAGE OF GOLD.**—The Treasury Department has directed the transfer of \$3,999,500 in gold bullion from the Assay Office in New York to the Philadelphia mint for coinage into eagles and half eagles. After the transfer there will still remain in the New York Assay Office about \$63,000,000 in bullion, more than enough to keep the Philadelphia mint employed for six months in coining gold exclusively. As nearly as can be estimated at the present time it is thought at the Treasury Department that the public debt statement for December, which will be issued on Monday, Jan. 3d, will show a reduction about the same as the statement for November, which was \$3,609,000. During this month about \$4,000,000 has been paid on account of pensions.

The Nevada Transcript says: During the month of November the Milton gravel mine yielded bullion to the amount of \$52,900; North Bloomfield gravel, \$31,900; Idaho quartz, \$41,600. These three mines are among the leading ones in Nevada county. There are 12 or 15 others here that make almost equally as good showings, but being close corporations it is impossible to obtain facts as to their outputs.

The Carson reduction works propose to treat ores by the leaching as well as by the smelting process.

## Selling Mines.

Within the past two years a great many men have gone from this coast to the Eastern States to sell mines. Not one in fifty of them were successful. Too many came at once, and too many thought the Eastern people would buy anything that came along, providing the specimens were rich enough. The New Yorkers did not bite as easily as they were expected to, which was a good thing for them in many instances, for more than one worked-out or played-out mine was offered for sale on a basis of statements far from the truth.

Now, although these men who spent their money and time as mining missionaries did not reap great rewards themselves, their labors have borne fruit. Attention was called to mining matters, and thousands of Eastern people have begun to claim something about mines. They have invested all over the country, more particularly in Colorado, however. They are now buying up property in Arizona, New Mexico and Idaho.

It is pleasant to note, moreover, that California has not been neglected. A number of Eastern private companies are operating in this State now, and many proprietors have been sold this year to Chicago, New York and Boston companies. Most of the mines purchased have been those what were developed and opened subsequently for the purchasers to see what they were buying. No fancy prices were paid either. In fact we notice the Eastern people are taking kindly to our drift mines, and many pieces of that kind of property have changed hands of late. In regard to the prospect of selling mines, the New York World says it is easier to do it now in New York than it was six months ago. It says: "There is not this boom which made the Fifth Avenue Hotel a mining rendezvous, a year ago, but there is not the horror of the word 'mine' which was felt after Little Chief joined Chrysolite and Pittsburgh in its farewell to dividends. Mining is on a better basis than it has been before in this city. Capitalists are willing to invest in good mines, but they wanted to be assured that they are good. Large sales of mining property have been negotiated during the past month with noticeable ease. A man who came here recently with a 20-day bond on a \$200,000 property closed a bargain within 10 days after his arrival. It was, however, an extra bargain. There is less disposition to overcapitalize than there was a year ago, and a diminished tendency to stacking mines at all. Sales this winter seem to be largely to men who are not in for a stock deal, but who propose to work the properties bought. The revival of some of the properties which have been under a cloud, and the genuinely rich developments of the past season in Colorado, Arizona and New Mexico have had an excellent effect in restoring that desideratum, a cautious confidence in mining properties."

## Idaho Mines.

New Mexico and Arizona are preparing for a "boom," in the spring, and already many miners are flocking to the several districts in these Territories. Idaho, too, is attracting a good deal of attention, and will attract more next year. Most of those who are thinking of investing there are from the East, and in view of the fact that Leadville has helped to give Colorado a sort of black eye this summer, Idaho will come in for a greater share of attention than formerly, and take, in some measure, Colorado's place.

Here in California it would be hard to do anything with Idaho mines. Not that the mines are not as good as others, but that former experiences were not happy ones. And it was not the fault of the mines, either, so much as the reckless and dishonest management, which brought discredit on all mining transactions in the Territory. The War Eagle Mountain mines, which have been so prominently before the people, and which were managed as gigantic steals, sickened our whole community. The actions, which occurred at Owyhee, disgusted everybody so that an Idaho mine could scarcely be given away.

Eastern people have not had these experiences, and will not have them. They will take hold of the mines themselves and work them, and we are not likely to hear of such awindles as formerly occurred. Many new districts have been opened in Idaho within the past few years, and the Territory is rapidly coming to the front as a bullion producer. The Yankee Fork Herald is quite sanguine as to the prospects of the Territory. It says:

That Idaho is destined, during the next two or three years, to step to the front as the greatest mining country in America, there is no question. She would have been much farther advanced to-day had not last winter been so severe. A good many orders will be given before spring for large mills and smelters, and the revival of mining interests will be general throughout eastern Idaho. The mines are known to be rich and all that remains now is for things to assume a proper shape for the rapid development and working of the mines. From all the mines worked the bullion product has been even better than those interested expected, and far above what was looked for by outside capitalists.

## Physical Studies of Lake Tahoe.—No. 1.

[BY PROF. JOHN LE CONTE.]

### Relation of Temperature to Depth.

By means of a self-registering thermometer (Six's) secured to the sounding-line, a great number of observations were made on the temperature of the water of the lake at various depths and in different portions of the same. These experiments were executed between the 11th and 18th of August, 1873. The same general results were obtained in all parts of the lake. The following table contains an abstract of the average results, after correcting the thermometric indications by comparison with a standard thermometer:

Abstract.	Depth in feet.	Depth in Meters.	Temp. in Fahr.	Temp. in Cent.
1	0-Surface	0-Surface	67°	19°.44
2	5	15.24	63°	17°.22
3	100	30.48	55°	12°.73
4	150	45.72	50°	10°.00
5	200	60.96	43°	5°.89
6	250	76.20	47°	8°.33
7	300	101.44	46°	7°.78
8	330*	100.68	45°.5	7°.50
9	400	120.92	45°	7°.22
10	480*	146.30	44°.5	6°.94
11	500	152.40	44°	6°.67
12	600	182.88	43°	6°.11
13	772*	235.30	41°	5°.00
14	1506*	459.02	39°.2	4°.00

\* Bottom.

It will be seen from the foregoing numbers that the temperature of the water decrease with increasing depth to about 700 or 800 ft. (213 or 244 meters), and below this depth it remains sensibly the same down to 1,506 ft. (459 meters). This constant temperature which prevails at all depths below—say 250 meters—is about 4° Cent. (39°.2 Fahr.). This is precisely what might have been expected; for it is a well-established physical property of fresh water that it attains its maximum density at the above indicated temperature; in other words, a mass of fresh water at the temperature of 4° Cent. has a greater weight under a given volume (that is, a cubic unit of it is heavier at this temperature) than it has at any temperature either higher or lower. Hence, when the ice-cold water of the snow-fed streams of spring and summer reaches the lake, it naturally tends to sink as soon as its temperature rises to 4° Cent., and conversely, when winter sets in, as soon as the summer-heated surface water is cooled to 4°, it tends to sink. Any further rise of temperature of the surface water during the warm season, or fall of temperature during the cold season, alike produces expansion, and thus causes it to float on the heavier water below; so that water at 4° Cent. perpetually remains at the bottom, while the varying temperature of the seasons and the penetration of the solar heat only influence a surface stratum of about 250 meters in thickness. It is evident that the continual outflow of water from its shallow outlet cannot disturb the mass of liquid occupying the deeper portion of the lake. It thus results, that the temperature of the surface stratum of such bodies of fresh water for a certain depth, fluctuates with the climate and with the seasons, but at the bottom of deep lakes it undergoes little or no change throughout the year, and approaches to that which corresponds to the maximum density of fresh water. Analogous results were obtained, nearly a century ago, from the observations of Horace Benedict De Saussure in the Swiss lakes by means of a thermometer of his own invention. The following table contains De Saussure's results (Ann. de Chim. et de Phys., second series, Tome 5. Page 403. Paris, 1817):

Lake.	Month.	Temp. of Surface.	Depth in Meters.	Temp. at Depth.
Geneva.....	August.....	21°.20 C.	49	6°.10 C.
Geneva.....	February.....	5°.63 "	309	5°.33 "
Constantine.....	July.....	17°.50 "	127	4°.25 "
Briancon.....	July.....	20°.00 "	162	4°.75 "
Thun.....	July.....	18°.75 "	114	5°.00 "
Neuchâtel.....	July.....	23°.10 "	106	5°.00 "
Lucerne.....	July.....	20°.00 "	195	4°.83 "
Bienne.....	July.....	20°.70 "	71	6°.90 "
Anney.....	May.....	14°.53 "	53	5°.56 "
Bourget.....	October.....	17°.53 "	78	5°.33 "
Maggiore.....	July.....	25°.00 "	109	6°.75 "

It is evident that the results of the experiments of the distinguished Swiss physicist, although executed with an imperfect thermometric instrument, in a general sense afford a striking confirmation of the deduction from my observations in relation to the distribution of temperature at different depths in the waters of Lake Tahoe.

### Why the Water Does not Freeze in Winter.

Residents on the shores of Lake Tahoe testify that, with the exception of shallow and detached portions, the water of the lake never freezes in the coldest winters. During the winter months the temperature of the atmosphere about this lake must fall as low, probably, as 0° Fahr. (—17°.78 Cent.). According to the observations of Dr. Geo. M. Bourne the minimum temperature recorded during the winter of 1873-4 was 6° Fahr. (—14°.44 Cent.). As it is evident that, during the winter season, the temperature of the air must frequently remain for days, and perhaps weeks, far below the freezing point of water, the fact that the water of the lake does not congeal has been regarded as an anomalous phenomenon. Some persons imagine that this may be due to existence of subaqueous hot springs in the bed of the lake—an opinion which may seem to be fortified by the fact that

\* Similar confirmatory results were obtained by Sir H. T. de la Beche, in 1819-20, by means of a self-registering minimum thermometer. Thus he found (Ann. de Chim. et de Phys. Second Series, Tome 19. Page 77 et seq. Paris, 1821):

"hot springs" do occur at the northern extremity of the lake.

Lake.	Month.	Temp. of Depth in Surface.	Temp. at Meters.	Temp. at Depth.
Geneva.....	September....	19°.5 C.	23	11°.6 C.
Geneva.....	September....	19°.5 "	62	7°.3 "
Geneva.....	September....	19°.5 "	62	6°.6 "
Geneva.....	September....	19°.5 "	140	6°.4 "
Geneva.....	September....	19°.5 "	241	6°.4 "
Geneva.....	September....	19°.5 "	300	6°.4 "
Thun.....	.....	15°.6 "	192	5°.3 "
Zug.....	.....	14°.4 "	70	5°.0 "

But there is no evidence that the temperature of any considerable body of water in the lake is sensibly increased by such springs. Even in the immediate vicinity of the "Hot springs" (which have in summer a maximum temperature of 55° Cent., or 131° Fahr.) the supply of warm water is so limited that it exercises no appreciable influence on the temperature of that portion of the lake. This is further corroborated by the fact that no local fogs hang over this or any other portion of the lake during winter, which would most certainly be the case if any considerable body of hot water found its way into the lake. The true explanation of the phenomenon may doubtless be found in the high specific heat of water, the great depth of the lake, and in the agitation of its waters by the strong winds of winter. In relation to the influence of depth it is sufficient to remark that before the conditions preceding congelation can obtain, the whole mass of water, embracing a stratum of 250 meters in thickness, must be cooled down to 4° Cent., for this must occur before the vertical circulation is arrested and the colder water floats on the surface. In consequence, the great specific heat of water, to cool such a mass of the liquid through an average temperature of 8° Cent. requires a long time, and this cold weather is over before it is accomplished. In the shallower portions, the surface of the water may reach the temperature of congelation, but the agitation due to the action of strong winds soon breaks up the thin pellicle of ice, which is quickly melted by the heat generated by the mechanical action of the waves. Nevertheless, in shallow and detached portions of the lake which are sheltered from the action of winds and waves, as in "Emsrald bay," ice several inches in thickness is sometimes found. The operation of similar causes prevents the deeper Alpine lakes of Switzerland from freezing under ordinary circumstances. Occasionally, however, during exceptionally severe and prolonged winters, even the deepest of the Swiss lakes have been known to be frozen. Thus, the lake of Geneva (maximum depth, 334 meters) was frozen in 1762 and 1805. The lake of Constance (maximum depth, 276 meters) was frozen in 1477, 1572, 1596, 1695 and 1830. The lake of Neuchâtel (maximum depth, 135 meters) was frozen in 1573, 1656, 1795 and 1830. The lake of Zurich has been frequently frozen, and although its maximum depth is about 195 meters, yet it is well known that this narrow and elongated body of water is very shallow over a large portion of its area, a fact which sufficiently explains its greater liability to be frozen.

**Why Bodies of the Drowned do not Rise**  
A number of persons have been drowned in Lake Tahoe (some 14) between 1860 and 1874, and it is the uniform testimony of the residents that in no case where the accident occurred in deep water, were the bodies ever recovered. This striking fact has caused wonder-seekers to propound the most extraordinary theories to account for it. Thus one of them says: "The water of the lake is purify itself, but on account of the highly rarefied state of the air it is not very buoyant, and swimmers find some little fatigue, or in other words they are compelled to keep swimming all the time they are in the water, and objects which float easily in other water sink here like lead." Again he says: "Not a thing ever floats on the surface of this lake, save and except the boats which ply upon it."

It is scarcely necessary to remark that it is impossible that the diminution of atmospheric pressure due to an elevation of 6,250 ft (1,905 meters) above the sea level could sensibly affect the density of the water. In fact, the coefficient of compressibility of this liquid is so small that the withdrawal of the above-indicated amount of pressure (about one-fifth of an atmosphere) would not lower its density more than one 100,000th part. The truth is, that the specific gravity of the water of this lake is not lower than that of any other fresh water of equal purity and corresponding temperature. It is not less buoyant or more difficult to swim in than any other fresh water, and consequently the fact that the bodies of the drowned do not rise to the surface cannot be accounted for by ascribing marvelous properties to its waters. The distribution of temperature with depth affords a natural and satisfactory explanation of this phenomenon, and renders entirely superfluous any assumption of extraordinary lightness in the water. The true reason why the bodies of the drowned do not rise to the surface is evidently owing to the fact that when they sink into water which is only 4° Cent. (7.2 Fahr.) above the freezing temperature, the gases usually generated by decomposition are not produced in the intestines. In other words, at this low temperature the bodies do not become inflated, and, therefore, do not rise to the surface. The same phenomenon would doubtless occur in any other body of fresh water under similar physical conditions.

SEVERAL Montana mining properties are about to be incorporated in Salt Lake.

### The California Washer.

Mr. George M. Pursell, of San Joss, Santa Clara county, has recently patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a washing machine which has several advantageous improvements. The machine is one of that class which has a semi-cylindrical-containing body, and a similarly-shaped rubber which is adapted to be oscillated or rotated about an axis, so that the clothes may be rubbed between the two corrugated surfaces.

In this machine the axis, or journal, about which the rubber oscillates, is supported within hinged swinging boxes at each side. Within these boxes is employed a spring, or springs, which press upon the journals from above, and hold the rubber down with any desired tension, while at the same time it is allowed to give and adjust itself to any irregularity in the position of the clothing underneath it. A peculiar-looking device serves to retain the swinging boxes in place, or to release them when it is desired, to remove the rubber for the purpose of attending to the contents of the washer.

The corrugated rubber bars are constructed

### PRECIPITATING VAT FOR OBTAINING THE SILVER IN LEACHING PROCESS.

in a novel way, so that the clothes are operated upon in a peculiar manner. At the same time an escape passage is provided through the bottom for the dirt and sediment without allowing such large spaces that the clothes will pass through and become entangled or clogged.

The rubber can be turned out of the tub about its pivots, when desired.

In the formation of the corrugated surfaces in the bottom of the tub and upon the rubber, various devices have been employed. When wooden bars have been used they must, to be effective, be separated widely enough to enable them to take a good hold upon the clothes. This sometimes allows the clothes to pass through the spaces and to clog the machine, and in order to remedy this, and at the same time to provide the necessary space between the projecting bars to give the proper rubbing action, these have been formed with groove or depression cut in the center, leaving the projection upon the outer edges. The objection to this form is that the dirt will settle in the grooves.

Mr. Pursell's construction of the cross bars is intended to provide a wider space between the projecting rubbing portions of the bars, and at the same time to make the spaces between the bottom of the bars so narrow that the clothes will not work through.

The bars are formed of an L or J shape, the vertical portion projecting up toward the center of the tub, while the horizontal portions of each extend along toward the next bar, and leaves just space enough between to allow the dirt to escape, at the same time the vertical portions are so far separated that they will take a good hold of the clothes and produce a good rubbing action. The bars on the rubber are the same form as those within the tub.

By these improvements the machine is rendered more efficient, is easier to work, and the clothes may be easily inspected or changed without entirely removing the rubber.

TYNDALL DISTRICT, in the Santa Rita mountains, Arizona, is said to contain undeniably good mines and an abundance of wood and water. Several companies have taken hold of the aforesaid properties and the Santa Rita mountains will soon take a place in the front rank of mining districts in this great and growing Territory. The general formations are granite, porphyry, syenite and limestone. The Jesuits in olden time found native silver in quantities, from which they made various articles of domestic use.

### Precipitation of Silver in Leaching Process.

In the leaching of ores after the processes by which the silver is taken into solution, the brine containing the silver obtained from the leaching tanks, flows through a trough or rubber hose into the precipitating vats. These vats are from five to six ft. high, and four ft. in diameter. One of these precipitating vats is figured in a recent publication,\* and we illustrate it herewith to show the form:

The bottom, *a*, is laid out with Roman cement, and the sides inclining toward the large brass cock, through which the precipitated silver is discharged directly into the filter below—the filter being two ft. wide by three or four ft. long, and from eight to ten inches deep. The solution that runs through the filter falls into the trough, *b*.

According to the capacity of the works, there must be from four to eight of these vats. When the solution, coming from the leaching vats, rises to within eighteen or twenty inches from the rim of the vat, the flow is turned into the next vat, and the precipitation of the first

one commences immediately. For this purpose a bucketful of the sulphide of calcium is poured into the vat, and the silver precipitated. The solution is then stirred vigorously.

Treating always the same kind of ore, the required quantity of the precipitating agent is soon learned. The black precipitate sinks to

The California Washer.

the bottom, and the workman now dips a little of the clear liquid out in a glass tube or tumbler, and adds a few drops of the sulphide of lime. If a dark precipitate or a dark color is produced, it shows that there is still silver in the liquid, and more of the agent must be added; but if, on the contrary, no precipitate is observed, there is either enough or too much of the sulphide. To prove this, some of the silver-holding liquid is added to a test taken from the other tank under treatment. If in this case a precipitate is formed, silver-holding liquid must be carefully added to the liquid in the tank until no reaction is produced. This work, delicate as it seems, is easily learned by the workmen. If a little silver should be left in the liquid, it is not injurious, neither is the silver to be considered as lost, because the same liquid is used over again; but a small excess of the sulphide of calcium would cause a loss in silver, as it precipitates sulphide of silver in the leaching tank in the mass of ore, which is not dissolved again. The precipitation is performed in a short time, requiring about fifteen minutes for each tank. The stirring must be

\*Roasting of Gold and Silver Ores, by G. Kustel, for sale by Dewey & Co.

executed with vigor. Wooden grates fixed to a vertical stem will answer this purpose. Some use perforated wooden disks on the stem. After the last portion of the precipitant has been added and well stirred, the precipitated silver will soon settle; but it is well to allow one hour's time at least. The liquid must be clear. All the sulphide of calcium that was used, by giving up a part of its sulphur to the silver, is reduced to hyposulphite of lime, and in this way the amount of hyposulphite is constantly increasing; but on the other hand there is also some waste occurring at the end of the leaching. If the sulphide of calcium is made too weak, the hyposulphite of lime becomes diluted by degrees, and the lixivation would be imperfect.

The clear solution above the settled precipitates must be drawn off, either with a rubber syphon, to one end of which two short pieces of wood are fastened—as shown in the engraving, *c*—so as to prevent the hose from touching the bottom, in which case it would draw precipitated silver; or the clear solution can be removed also by a more convenient syphon, shown by *d*, which is made of a lead pipe. By lowering the same, the clear solution commences to flow through the outside end, as soon as it sinks below the level of the solution.

The solution from this precipitating vat runs through the gutter, *b*—shown in the engraving—into a large vat, from which it is pumped up into the solution vat, standing above leaching vats. The hyposulphite of lime is thus constantly circulating from the uppermost solution vat through the leaching vat into the precipitating tubs, and from thence into the lowest receiving vat, again to be pumped up into the solution vat. For this purpose wooden pumps answer very well.

### The Mechanics' Institute.

The report of the Fifteenth Industrial exhibition of the Mechanics' Institute has been published in pamphlet form. As we have before stated, the financial result was most satisfactory, and considering the time and circumstances, is a positive assurance that the Industrial fairs of the association are based upon a firm foundation, and that they supply the public with a place of resort where pleasure and profit can be obtained for a small outlay of money. The detail reports show that the gross receipts of the fair amount to \$41,106.05, the total expenses are \$27,271.33, leaving a net profit of \$13,834.72, which amount has been transferred to the treasury of the Institute. It is proper to add that the ordinary expenses of the fair were only \$22,981.42. The remaining sum of \$4,289.91 being for medals and cash premiums paid to exhibitors.

To the report of this fair is appended the report of P. B. Cornwall, the President, who shows the extent of the pecuniary benefit which the library has derived from the fair.

The books of the Institute show that the net profit derived from the first eight fairs, including sale of the buildings in which they were held, was \$88,860.30, and from the last seven fairs, all of which have been held in the building on Eighth street, the net profit paid to the Institute is \$72,674.18 cash, besides paying for the exhibition building and contents, now the property of the Institute, unincumbered, which building and fittings cost \$106,330.61, thus showing a net receipt of \$179,004.79 from the last seven fairs; and a grand total of \$267,865.09 as the result of the 15 fairs held under the auspices of this Institute.

The Board of Trustees have succeeded in obtaining from the owner of the ground a renewal of the lease for the lot occupied by the pavilion—the consideration is, payment of the taxes, which amount to \$4,760.78. The renewed lease will expire December 31, 1881.

Mr. Cornwall concludes: "Without discussing the broader aspects of industrial fairs, such as their educational and enlightening influence on the community at large, and their commercial benefit to the city and the State, it is sufficient for my present purpose to direct your attention to their continuance as necessary to the prosperity of the Institute, and to enable us to establish and maintain such lectures, classes and other means for technical education, as are properly within the province of such an institution as ours, and as will probably in the near future become its most distinctive features, when the place of a miscellaneous circulating library will be more completely filled by the free library, sustained by city taxes."

THE November bullion product of the mines at Leadville, Colorado, was upward of \$1,000,000, as follows:

Value of Silver.....	\$708,169
Value of Gold.....	963
Value of Lead.....	263,411
Value of Ore.....	68,200

Total for November.....	\$1,040,722
Total for October.....	1,339,200
Total for September.....	1,602,200

The yield for November was \$300,000 less than was expected. The camp will show a product of at least \$14,000,000 for the year, which is a very good exhibit. The question now is, will the camp do as well next year, or will the deposits gradually give out.

THE Hecla smelters, Montana, recently shipped 83,000 lbs. of bullion.

**NEW WORK IN OLD MINES.**—The Reno Gazette says: In 1852, A. W. Poole, the present United States Marshal of California, had a five-stamp mill on a claim at the mouth of Humboldt canyon, on the south side of American river, a few miles from Dutch Flat. The ore worked less than \$25 a ton, which was not considered an object in those days, and the works were allowed to go to ruin and rot away. This year the mine has been re-opened; a good trail has been built to Alta, five miles, and a bridge over the river at Buchre bar. The suspension wires are cables from one of the street railroads in San Francisco. A five-stamp mill was built last summer, and started up in July. There are from 4 to 5 ft. of ore. Hon. J. H. Neff, of Dutch Flat, has a patent for a claim higher up, called the Pioneer. A good deal of rich ore was taken out of it in early days, but it was not properly taken care of, and caved in. The old mill has rotted down, and the drifts have filled up. Some work is being done on it now, however, and the ledge was found the other day. It promises to be very rich. The drift mine, at Damascus, which has not been worked since 1852, is also looking up. The vein has been lost several times. It is now giving out very rich gravel.

**THE ELECTRICAL SPUR.**—As a supplement to the electrical hit, noticed some time ago, it may now be stated that Mr. G. Huttman, imperial quarry at Vienna, employs the electrical current in a very ingenious manner, in order to facilitate the management of the horse, especially for ladies. What next?

## Business Directory.

We furnish Telephones for \$10 per set. Wire, 5 cents per rod; Insulators, 15 cents each for every 200 feet of line. Illustrated instructions for putting up.

SAN FRANCISCO.

## LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!

PATENTS REISSUED 1868.

The "OLD RELIABLE" with improvements, making it

THE MOST PERFECT TURBINE NOW IN USE.

Comprising the Largest and the Smallest Wheels, under both the Highest and Lowest head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for New Prices, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

**JAMES LEFFEL & CO.,** Springfield, Ohio,  
and 110 Liberty St., N. Y. City.

## LEA AND PERRINS' SAUCE,

Which are calculated to deceive the Public, Lea and Perrins have adopted A NEW LABEL, bearing their Signature, thus,

*Lea & Perrins*

Which is placed on every bottle of WORCESTERSHIRE SAUCE, and without which none is genuine.

Ask for LEA & PERRINS' Sauce, and See Name on Wrapper, Label, Bottle and Stopper. Wholesale and for Export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen throughout the World.

## INGERSOLL

## Rock Drill and Air Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Comstock.

**GEO. R. FOARD, GEN'L AGENT,**  
No. 18, First St., S. F.

## CAUTION.

To John B. Reynolds and the firm of Reynolds & Rix, and the Public generally.

Notice is hereby given that George R. Foard, of No. 18 First Street, San Francisco, is the sole authorized agent for the sale of our manufactures, consisting of Rock Drills, Air Compressors, and duplicate parts of either in the territory known as the Pacific Slope, formerly under the agency of John B. Reynolds, but now under the sole agency of George R. Foard; and that no other person or persons have any right or authority to represent themselves as the agents of this Company within the above mentioned territory.

Also, take notice, that all persons manufacturing, or using any Rock Drills, Air Compressors, or duplicate parts of either, manufactured by others, embracing in their construction the mechanical inventions and appliances covered by the Patents owned by this Company, will be prosecuted for such infringement.

**INGERSOLL ROCK DRILL CO.**  
New York, November 30, 1880.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING DECEMBER 21st, 1880.  
235,730.—SOAP.—Henry J. Borie, S. F.  
235,622.—DITCHING MACHINE.—Thomas J. Chappelle and J. T. Ricketts, Gilroy, Cal.  
235,764.—FILTER.—T. Guinean, Sacramento, Cal.  
235,632.—SASH FASTENER.—Antone Haytt, S. F.  
235,816.—AIR COMPRESSOR.—E. A. Rix, S. F.  
NOTE.—Copies of U. S. and Foreign Patents furnished by DREW & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

AIR-COMPRESSOR.—E. A. Rix, San Francisco. Patented Dec. 21, 1880. No. 235,816. This invention relates to certain improvements in machines which are employed to compress air, and of that class in which the cylinders are provided at their compressing ends with a discharge-valve of the full area of the cylinder. It consists mainly, in the employment of a discharge-valve which occupies the entire area of the cylinder, and a means for regulating and adjusting the tension of this valve to make it close evenly all around and prevent chattering. In the construction of air-compressors various devices have been employed to allow the air to be entirely discharged at each stroke of the piston, and among others the employment of a single large valve which occupies the entire end of the cylinder, and which opens during the stroke of the piston and closes instantaneously when the piston commences its return stroke. This valve has hitherto been objectionable because it has not been possible to so regulate its tension in every case that it will not chatter and make a great noise when at work, and this difficulty has caused this class of compressors to be almost entirely abandoned. As it has been used in horizontal cylinders, dirt will unavoidably collect at the bottom of the cylinder, and will obstruct the seat on that side so that the valve will not close perfectly and will leak. The horizontal movement of the valve will also soon wear the lower side of the guide-opening so that the valve will not close truly. This invention consists in the combination with a valve of this construction, of a tension screw by which the valve may be actually adjusted and all chattering prevented.

FILTER.—Thos. Guinean, Sacramento, Cal. Patented December 21, 1880. No. 235,764. This filter is especially adapted to cleanse, purify and prepare muddy river and other soft water for culinary, drinking and other purposes. It consists of a vessel of suitable dimensions, having a partition which supports a filter. The filtering material is placed above and around this filter in such a manner that the water, after passing through the material, enters the chamber and from there flows into the receiver. From the top of the chamber two air pipes extend up to a point above the top of the filter, one being a little longer than the other, so that one supplies air to and the other discharges air from the chamber.

AN IMPROVEMENT.—The ore taken out at the Union Con. is being crushed at the stamp mill near the C. and C. shaft. Heretofore when brought in by the cars on the C. and C. side track it has been dumped on the platform on a level with the upper floor of the C. and C. works. It was then necessary to shovel it into cars and run it through the works in the mill. The handling of the ore with shovels was found to be expensive and slow. An excellent improvement has now been made. A track has been laid from the mill through on the lower floor of the works of the C. and C. and thence a tunnel run that passes under the C. and C. side track. In the side track has been placed a chute, into which the cars discharge, the ore being carried down to the tunnel in which is the car track leading to the mill. The bottom of the chute is provided with a gate for convenience in loading cars.—Virginia Enterprise.

SAYS the Homer, Mono county, Index: The surface of the country in Homer and adjacent districts is so favorable for deep workings by means of tunnels that we confidently expect to see many organizations for the purpose of exploring our mountains at a great depth.

THE Santa Fe New Mexican says that the San Pedro and Canyon del Agua company is employing a large force of men in all the branches of its mining work. The copper and gold mine is being developed by day and night shifts.

THE New York Hill mining company will pay its 10th dividend on the 3rd of January, of 20 cents per share, amounting to \$10,000.

Our State Government.

The following list comprises the representatives of the Executive, Judicial and Legislative departments of the State of California. It is worthy of preservation as a means of reference:

News in Brief.

EXTENSIVE floods are reported in Corunna, Spain.

THE Rev. Dr. Edwin H. Chapin died in New York Monday.

THE railroad tax of Placer county pays all the county's expenses.

PRESIDENT-ELECT ANDERWERT, of Switzerland, has committed suicide.

THERE is a great deal of smouldering discontent among the north Albanian chiefs.

CAMBRIDGE, Mass., on Tuesday, celebrated the 250th anniversary of its settlement.

RUSSIA has increased duties on imports 10%, and has raised the tax on all trade goods.

THE New York Board of Aldermen has resolved to grant no licenses to Chinese laundrymen.

TEN Ponca chiefs signed a paper, declaring they wished to remain on their land in Indian Territory.

IT is the opinion of competent judges that Russia has made ample concessions on the Chinese question.

AT Castle Garden, New York, up to Monday morning, 318,937 immigrants had landed since January 1, 1880.

THE recent storm on the Atlantic coast was the severest that had visited some of the sections for 50 years.

By a collision between two freight trains near Charlotte, N. C., on Sunday, four persons were killed and several wounded.

THROUGHOUT the Northwestern States the weather is intensely cold, the mercury ranging from 17° to 30° below zero.

Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolldio. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St., S. F.

In the Whole History of Medicine

No preparation has ever performed such marvelous cures or maintained so wide a reputation, as AYRES' CHERRY PECTORAL, which is recognized as the world's remedy for all diseases of the throat and lungs. Its long continued series of wonderful cures in all climates has made it universally known as a safe and reliable agent to employ. Against ordinary colds, which are the forerunners of more serious disorders, it acts speedily and surely, always relieving suffering, and often saving life. The protection it affords, by its timely use in the throat and chest disorders of children, makes it an invaluable remedy to be kept always on hand in every house. No person can afford to be without it, and those who have once used it never will. From their knowledge of its Composition and effects physicians use the CHERRY PECTORAL extensively in their practice, and Clergymen recommend it. It is absolutely certain in its remedial effects, and will always cure where cures are possible.

FOR SALE BY ALL DEALERS.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half year ending this date, the Board of Directors of The German Savings and Loan Society has declared a dividend on Term Deposits at the rate of five and two-fifths (5 2/5) per cent. per annum, and on Ordinary Deposits at the rate of four and one-half (4 1/2) per cent. per annum, free from Federal Taxes, and payable on and after the fifteenth (15th) day of January, 1881. By order, GEORGE LITTLE, Sec'y. San Francisco, December 31, 1880.

DIVIDEND NOTICE.

San Francisco Savings Union,

532 California Street, corner Webb.  
For the half year ending with thirty-first (31st) December, 1880, a Dividend has been declared at the rate of five and two-fifths of one (5 2/5) per cent. (5 2/5) per annum on term deposits, and four and one-half (4 1/2) per cent. per annum on ordinary deposits, free of Federal tax, payable on and after Monday, seventeenth (17th) January, 1881.  
LOVELL WHITE, Cashier.

ANNUAL MEETING.

THE ANNUAL MEETING OF THE

Stockholders of the Silver King Mining Company.

Will be held at the office of the Company, Room 13, No. 323 Montgomery street, San Francisco, on Tuesday, January Eleventh (11th), 1881, at 12 o'clock, noon, for the election of a Board of Trustees to serve for the ensuing year, and for the transaction of such other business as may properly come before the meeting. Transfer books will close January Eighth (8th), 1881, at 12 o'clock, noon, and remain closed until after the meeting. San Francisco, December 29, 1880.

Alpha Hydraulic Gravel Mining Company.

Location of principal place of business: San Francisco, Cal. Location of works: Alpha Hill, Nevada County, California.

Notice.—There are delinquent upon the following described Stock, on account of Assessment (No. 2) levied on the nineteenth (19th) day of November, 1880, the several amounts set opposite the names of the respective Shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amt.
James Ireland, Trustee.....	10	1,000	\$200
John H. Hayes.....	14	200	40
William H. Hamilton.....	18	1,000	200
Alexander Girvin.....	19	650	110

And, in accordance with law, and an order of the Board of Directors, made on the nineteenth (19th) day of November, 1880, so many shares of each parcel of said Stock as may be necessary, will be sold at public auction at the office of said Company, No. 216 Sansome Street, San Francisco, Cal., on Monday the tenth (10th) day of January, 1881, at the hour of one (1) o'clock, P. M., of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of sale.

JAMES IRELAND, Sec'y.  
Office—No. 216 Sansome Street, San Francisco, California.

A NEW TREATMENT

For Consumption, Asthma, Bronchitis, Dypnoea, Catarrh, Headache, Debility, Rheumatism, Neuralgia and all Chronic and Nervous Disorders. It is taken

BY INHALATION,

And acts directly upon the great nervous and organic centers, and cures by a natural process of revitalization.

SENT FREE:

A Treatise on Compound Oxygen, giving the history of this new discovery, and a large record of most remarkable cures. Write for it. Address the proprietors, DR. SPARKS & FALLEN, 100 and 111 Girard street, Philadelphia, Pa., or H. E. MATHEWS, 506 Montgomery street, San Francisco, Cal., from whom can be procured both information and supplies.

People May Hear With DEAF AUDIPHONES OR WITH EARPHONES.

Trial before purchase. Don't waste your money otherwise. Send for free pamphlets. (Address H. E. Mathews, as above.)

BOESCH'S PATENT

Hydraulic Mining and Locomotive Head Lights, with the Latest Improvements, making them the best and cheapest in the market.

Pacific Lamp and Reflector Factory.

569 Mission Street, San Francisco.

ADVERTISE

Throughout the Pacific States and Territories in the PACIFIC RURAL PRESS, San Francisco, Cal. Principal Agricultural paper in Pacific States. Illustrated. Send stamp for sample and rates.

## VULCAN BLASTING POWDER.

THE MOST ECONOMIC AND BEST NITRO-GLYCERINE EXPLOSIVE IN MARKET.

For the year 1881 we are prepared to make MOST LIBERAL ARRANGEMENTS. Having unequalled facilities we are in position to offer BEST TERMS, and purchasers will serve their own interest by conferring with the Company, before concluding arrangements elsewhere.

NOS. 1, 2 AND 3 VULCAN,  
TRIPPLE FORCE CAPS,

And all Grades of Fuse at Bottom Rates.

## MOREY & SPERRY,

MANUFACTURERS OF

### Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

### IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

## GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

## Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO.,  
SAN FRANCISCO, CAL.

## AIR COMPRESSORS PRICES REDUCED. SEND FOR NEW CATALOGUE. CLAYTON STEAM PUMP WORKS 14 AND 16 WATER STREET, BROOKLYN, N. Y.

# TONITE

## PATENT SMOKELESS BLASTING POWDER.

This Powder has been in use in England for five years, and its consumption has steadily increased; the sales this year being quite 25 per cent. more than in 1879. It has given the greatest satisfaction, and wherever it has received a trial, it is preferred to any of the other high explosives on the market, on account of its remarkable merits, which will be even more highly appreciated on this coast than in England, owing to the greater extremes of heat and cold in our Mining Districts.

IT DOES NOT **FREEZE**.

IT DOES NOT **DETERIORATE** WHEN KEPT IN **HOT PLACES**.

IT DOES NOT GIVE OFF **NOXIOUS FUMES**.

IT CAN BE BURNED LIKE A TORCH IN DRIFTS, TUNNELS, ETC., WITHOUT CAUSING THE MINERS WORKING THERE ANY INCONVENIENCE; ON THE CONTRARY, IT FURNISHES A LIGHT OF GREAT BEAUTY AND INTENSITY.

IT DOES NOT CONTAIN NITRO-GLYCERINE, CHLORATE OF POTASH, SULPHUR, PICRIC ACID, NOR ANY OTHER SUBSTANCE WHICH EXPLODES BY FRICTION, HENCE IT CAN BE CONSIDERED THE SAFEST BLASTING POWDER IN USE, YET WHEN PROPERLY DETONATED IT HAS NO SUPERIOR IN STRENGTH.

WHILE TONITE CAN CONFIDENTLY BE RECOMMENDED FOR ITS SAFETY IN TRANSIT, STORAGE AND ORDINARY HANDLING (NO ACCIDENT HAVING OCCURRED WITH IT), THE FACT THAT IT IS A VERY POWERFUL EXPLOSIVE SHOULD NOT BE OVERLOOKED.

TONITE IS ALLOWED TO BE TRANSPORTED OVER THE RAILWAYS OF GREAT BRITAIN, A PRIVILEGE NOT EXTENDED TO ANY OTHER HIGH EXPLOSIVE.

The Company manufactures besides Tonite and DETONATORS, also the ETNA CAP, which is superior to any other in the market for exploding Nitro-Glycerine and other Powders. Also the Patent Socket Distress and Alarm Ship-Signals; also, Fog Signals, Torpedoes, Rockets without sticks, etc. Tonite is destined to supersede Nitro-Glycerine Powders as surely as they have superseded common gun-powder, as the miners will quickly appreciate the value of an explosive, which, while as strong as Giant Powder, gives off no noxious fumes, does not Freeze, does not lose its Strength with age, and is much safer to handle. In offering this "explosive of the future," as it has been called by prominent scientists in Europe, we ask consumers for a share of their patronage, and a chance to prove our assertion.

Please address all communications to

HAMILTON SMITH, Jr. President.  
WM. LETTS OLIVER, Gen. Manager.  
RALPH L. SHAINWALD, Sec'y.

Hoisting and Pumping Machinery.

### STEIGER & KERR'S CONTINUOUS DISCHARGE AND GRINDING PAN.

This pan is designed to receive ore direct from a rock breaker and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all; and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is simple, is a most important improvement in the working of gold ores, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The plan of feeding is the same as in the stamp mill, either an ore feeder or hand feeding being adapted, as may be desired. Parties interested in mining and mills can see the Pan in operation by calling at the OCCIDENTAL FOUNDRY, STEIGER & KERR, 137 First St., S. F.

### Mining and Scientific Press Patent Agency.

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice free. Address, DEWEY & CO.,  
Office MINING AND SCIENTIFIC PRESS and PACIFIC RAIL PRESS, 202 Sansome Street, S. —1880.

## Welding.

There is a good deal more skill in welding properly than is generally supposed. The skillful blacksmith will weld quickly and neatly, while the clumsy one will do it slowly and in a slovenly manner. The same work is apparently done by each, but the results are by no means the same. In mining work particularly the lives of the men often depend on the work done by the blacksmith. Faulty or careless work on his part may lead to very disastrous results. A great deal depends on the way the work is done.

In speaking of welding a Southern blacksmith gives to the *Blacksmith and Wheelright* some examples of heavy welding, as for example jump welding long shafts, and scarf and swallow fork welds for the same. We repeat his remarks with the engravings accompanying them to illustrate his ideas. He says: In my opinion the jump weld is decidedly the best, if properly done, as it can be bent after welding to a right angle without showing any sign of the weld.

To make a jump weld properly the ends should be rounded, as shown in figure 1, and, after being brought to a welding heat with a good blast, drive them together with very light hammer blows, as a heavy blow would cause them to bounce. As the welding proceeds employ heavier blows and the weld will drive up as in figure 2, after which the weld may be forged and swaged down. This weld will bend to a right angle, as shown in figure 3, without showing the scarf, whereas a scarf weld, such as shown in figure 4, would show, when bent, its scarf as at A, in figure 5, while a swallow fork weld, such as is shown in figure 6, when bent will show its scarf, as in figure 7. Only the jump weld, you will see, will stand such bending and show a sound and complete weld.

## Legislative.

The Legislature convened at Sacramento on Monday, according to law, and the Governor's annual message was presented. We are unable to give the whole of this very full document, but shall take occasion hereafter to comment on its suggestions.

Mr. W. H. Parks, of Yuba Co., was elected Speaker of the House. Following officers were elected: McStay was elected Chief Clerk; Sergeant-at-Arms, Ezekiel Walker; Thos. Frazer, Speaker pro tem.; F. M. Pauley, Minute Clerk; J. H. Riley, Journal Clerk; Jacob Shans, Engraving Clerk; R. M. Apgar, Assistant Sergeant-at-Arms; D. H. Rand, Postmaster; Rev. Dr. Deal, Chaplain.

Wm. Johnson, President pro tem.; Secretary, Marcus D. Boruck; Assistant Secretaries, Jas. A. Orr, C. J. Johnson; Bart McNulty, Minute Clerk; J. R. Brierly, Journal Clerk; Edward C. Humphrey, Engraving Clerk; Mrs. Whittingham, Postmistress; Sergeant-at-Arms, Andrew Wasson; Assistant Sergeant-at-Arms, D. B. Kingery.

A number of bills have been introduced in both Houses. These we shall comment upon from time to time as occasion offers. They are too numerous to mention even by title in this issue.

It is certain that Gen. John F. Miller will be elected United States Senator.

Says the Red River (N. M.) *Chronicle*: The discovery of valuable mines in our Territory has created quite a demand for donkeys, and few can be procured for less than \$15 per head. Even parties from Leadville, the San Juan region and other mining districts in Colorado, come now to New Mexico to buy burros. Two good packers can manage from 15 to 20 donkeys to bring ore down the side of the mountains, where it would take thousands of dollars to construct a wagon road.

The upper part of Montana is a very rich mining region, the mountains being full of iron, copper, lead, silver and gold, the latter being both in quartz and placer mines.

PROSPECTING for coal in the Santa Cruz mountains will commence this spring.

## Stirring Roasting Ores.

A short time since we illustrated from Mr. Guido Kustel's "Roasting of Gold and Silver Ores" (for sale by Dewey & Co.), a simple roasting furnace. At that time we omitted to mention the arrangement of the door, with regard to facilitating the stirring of the ore. As, however, the method described is applicable to any of those furnaces when the ore is stirred by hand, we give place to it now. It is simply a device to take the place of the usual iron roller in front of the working door. It is a wheel, which allows the hoe to be directed to the re-

JUMP, SCARF, AND SWALLOW FORK WELDING.

quired points, which is not the case with the roller bars. The wheel, a, is about 2½ inches in diameter with ¾ inch journals, and has a grooved or hollowed face to receive the hoe handle. The

HOE FOR STIRRING ROASTING ORE.

pernal than that of the State Mineralogist. The act organizing the State Mining Bureau was one of the wisest measures passed at the last session. This, in part, is doubtless owing to its efficient management, for, although but

ROLLER FOR ORE ROASTING FURNACE DOORS.

the furnace, from the outside, by drilling two holes, and then screwing on a piece of bent iron of the shape shown. The hoe moves easily to and fro on the wheel, at the same time with the turn of the fork in any desired direction of the hearth. The engraving shows a grooved wheel one-quarter the size it should be made.

A hoe to be used with one of these furnaces is also shown in the engraving. It is of ½ inch wrought iron, six inches high and eight inches long, with a very long handle, it is preferable to use a piece of gas pipe, welding it to the rod handle as shown, so as to make it light.

WHITE PINE has shipped \$13,000,000 of bullion out of 28,000 recorded locations.

## The Executive and the Mines.

The Governor of the State of California is a good friend to the miner. He has been a miner himself, and now owns an interest in the famous Spring Valley hydraulic mine, we believe, and in some other mines as well. He took great interest in the organization of the State Mining Bureau, when it was formed, and still considers it a very important department, as the following paragraph from his message will show:

"Among the many reports presented for your consideration, I know none more deserving

them, and such other expenditure as may be rendered necessary for the practical benefit of the citizen.

"I have been informed that many very valuable and in some instances, exceedingly rare donations would be made to the Bureau were the same located in a building capable of showing them to advantage, and safe as a repository. To do this it will be necessary to change the present location, and as the value of the gifts would be greater than the outlay for rent, I deem it advisable such change should be made, and, in connection therewith, I would recommend that the mineral cabinet now bid away in our State library be transferred to the care of the Bureau, whose proper function it is to care for it."

It is probably just as well to bring that State library cabinet down here and put it in the general collection belonging to the State, and now increasing so fast as the Bureau. Mr. Hanks has not much room, however, where he is, his cases being all filled.

We hope also that a liberal fund will be allowed to fit out the Bureau with a complete and first-class mining and metallurgical library.

## Information About California Mines.

The Director General of the Mints of the United States has appointed Mr. W. A. Skidmore, a special agent of the Mint Bureau, to ascertain and report upon any facts connected with the sources of production of the precious metals in California. The appointment is a good one, as Mr. Skidmore is familiar with the various localities of the State from the experience gained by being for many years the California Deputy of the United States Mining Commissioner.

The Mint officials in this city have collected a large mass of statistics concerning the mines of this coast. A. M. Lawver who has charge of the details has brought intelligent energy to his work, and the results are entirely satisfactory. The work of Mr. Skidmore is to supplement the information already gathered. He is not to collect statistics, but information concerning the sources of production. He will describe the various large operations now going on in different parts of the State. He is to take cognizance of any new methods of mining, and new metallurgical processes or improved appliances for mining or milling.

In addition to the information being gathered in this way, the State Mining Bureau is busily engaged in collecting data of value to the mining public. It has already a large and valuable collection of ores, rocks and minerals. Maps of various localities have been gathered, and information of all kinds, which will be of use to the miners of the State, is being sought for from different sources. Mr. Hanks, the State Mineralogist, is busily engaged in preparing an elaborate report, in which he is aided by numerous assistants specially fitted to handle the special topics allotted to them. This report, when published, will no doubt be a most valuable addition to the literature of mining.

Besides this, the U. S. Geological Survey under Clarence King is doing a good deal of work in this State. They are collecting statistics of production, as well as information about mining and metallurgy which is general in its nature. That is, they will describe the processes in vogue for working the various kinds of ore, and describe the methods of working hydraulic, drift and quartz mines.

When all these reports are published, we shall have a large amount of information about mining and metallurgy, so that in future no mistakes can be made, and attributed to lack of sources for the acquirement of special knowledge.

THE New Jersey people want to buy up the smelting ore which Carson wants for her proposed smelter.

WATER was met at a depth of 750 ft. in the Eureka Con. Co's., new shaft.

BULLION and ore shipments from Colorado during 1880 amounted to \$22,500,000.

## Homer District.

## Development of the Leading Mine.

Public interest seems just now to justify a more thorough exposition and complete knowledge of operations in the Homer mining district, Mono county. Chief among them are those of the May Lundy mine and mill. The *Bodie Free Press* says: Owned by a private co-partnership, and conducted in a quiet and business-like manner, it is but natural that the owners have not considered it necessary that the public should understand the development and permanent resources of the mine. For the sake of the mining community, however, and the general interest in the Homer district, it has become important that the conduct of the May Lundy management should be better known. In view of these facts, we find ourselves enabled to set forth, from the best authority, the following statements: It is during the past three months that the

## Main Work of Development

Has been done. The owners have desired to conduct the mine entirely as a business enterprise, and have invested from time to time only such sums of money as was clearly apparent at each successive investment could be readily returned to them out of the mineral deposits in sight. Acting upon this plan, the operations have been conducted upon a comparative basis of sure returns. A tunnel of 311 ft. was first run through the solid granite before striking what has proved to be a main vein. August 25th last, upon striking this vein, a contract was let to Z. B. Ravenelle & Co., of Aurora and Bodie, for packing 1,200 tons of ore from the mine to a mill site, situated over five miles distant, upon Mill creek proper. It was thought by numerous parties that this amount of ore would never be extracted; nevertheless, 1,300 tons were packed down prior to Dec. 1st.

## A Main Drift

Has been run from the point of first striking the vein, as before mentioned, to a length of over 650 ft. from the tunnel mouth, or about a distance of 340 ft. upon the main vein. In this entire drift the vein has remained in a due course, a few degrees west of north, a width of between 18 inches and 6 ft., pitching 42° west, smooth walls, and assaying from \$35 to \$600 per ton. Stopes have been raised from the drift for a distance of less than 100 ft. in length, and, from the angle, to 60 ft. upward, and it is from this stope that the 1,300 tons have been mainly taken. Two hundred and fifty ft. of the drift has not been stoped at all, and from the level of the tunnel floor the top of the mountain is 500 ft. on the incline of the ledge. A winze has been sunk from the tunnel downward nearly 100 ft. From this it is clearly perceived that the May Lundy has

## Six Hundred ft. of Ore in Sight

For a distance of 400 ft. in length, including a short drift southward, not previously mentioned. If this amount of ore was all that the mine contains it is easy to calculate how far the owners have been justified in their operations and calculations. With a ledge 400 ft. in length, 600 ft. in height, averaging 30 inches in width and assaying an average assay of \$80 per ton, it is a good mine. With the strong surface indications of the ledge, running the whole length of the claim, 1,500 ft., and no reason to suppose that it does not go down, it appears there is scarcely a better prospect on the Pacific coast, and perhaps the word "mine" should be substituted for "prospect." Beside the main drift, there has been crosscuts of 20 and 40 ft. run eastward and westward, but not long enough now to cut the other veins which crop on the surface. At the mine have been built a substantial stone and lumber dining house, a lodging house to accommodate 80 men, a large blacksmith and tunnel house, a coal house, powder and store houses, and large stone platforms laid, on which to pile wood. The surface of the mine is broken and precipitous, and the buildings are perched in crevices. The trail from the mine to the mill is over four miles in length, and was built and repaired at great expense.

## The Mill

Has 5 stamps, 25 ft. of silver plates, blankets, clean-up pans, and the tailings are saved in a reservoir for future working. Of the 200 tons already worked, the yield has averaged \$65 per ton, and the proceeds considered incomplete. With better appliances undoubtedly more bullion would be produced. The mill is run either by an engine or a Leffel turbine wheel, and the machinery was made by Prescott, Scott & Co., of San Francisco. The May Lundy management will early next summer erect a 20 or 30-stamp mill close at the foot of the mine, run a lower tunnel and put up a tramway from it to the now mill, thus reducing expenses to a minimum. From the manager we learn that

## The Cost Per Ton

Of the ore on hand, including much dead work and "permanent improvements," has reached the high figure of \$42 per ton; but he is of the opinion, upon close calculation, that in another year the cost will be quickly reduced to \$15 per ton. He has amalgamated and shipped to the owners, notwithstanding discouraging delays and vexations, over \$12,000 in gold bullion of the finest quality, the last bar of \$3,000 being of a fineness of 797 gold and 217 silver; total, 984, and valued at \$16.13 per ounce. With such an exposition as this, it is apparent that Lundy is the "coming camp."

## Big Horn.

## The Country Next to be Heard From.

Not much is being said about the Big Horn valley, Wyoming, during all the excitements attending the discoveries of new El Dorados. The tide is turned toward New Mexico, Arizona, northwestern Texas and Old Mexico, and when the reaction comes, if it ever does, then the people will wake up to the fact that they have run by, skipped over and entirely forgotten that there is, in the northern part of Wyoming Territory, one of the richest valleys on the continent. It is of large area, and includes all the favorable points to be looked for by the farmer, the stock-raiser and the miner.

The distance, says the *Eureka Sentinel*, is only trifling for the eastern-bound traveler, from Southern Pass into the basin of the Big Horn, and as he moves down that stream, the climate and soil improve until the region where game has wintered, for 40 successive seasons, is reached. The old residents of the mountains and coast know what that means. It is good enough for them. Fruits of all the hardy kinds—apples, peaches, berries, etc., can be grown there, and the snow has never been known to lie upon the ground to exceed 24 hours. Groves are upon the banks of the river, and the basin sides are rich in gramma grass, which grows so luxuriant as to be easily cut with a mower.

The valley soil compares favorably, in depth of loam, with that of southern Minnesota.

About five years ago we saw an adventurous Montanian, Farley by name, striking for the Big Horn, with his little band of 60 stock cattle and household outfit complete. He took desperate chances, for the Sioux and Arapahoes were bad at that time. He located northeast of the Sweetwater mines somewhere about 75 miles, upon a spring claim, and has an unlimited supply for farming purposes and no one to interfere with his stock range. A letter from a gentleman at Green river, just received, says Farley has never been molested by the Indians, and has now a fine little farm, plenty of wild berry bushes (transplanted), 40 or 50 head of horses, and 570 head of cattle. He only lost one or two calves each spring, and that was during exceptionally hard storms. He has no stables or shelter; neither does he put up hay for his stock. They do not require it.

There are many settlers now in the valley, but the fear of Indian raids has kept back the rush of immigrants.

W. P. Clark, First Lieutenant Second Cavalry, has written to the adjutant general, United States army, department of Dakota, an elaborate report of a reconnaissance of the Big Horn mountains, made by a scouting and exploring party under his command, which started from Fort Keogh, Montana Territory, June 21, 1880. The trip was an extensive one, the party returning to Fort Custer on Sept. 3d. A general reconnaissance was made of the country to the southeast and northwest of the Big Horn range, the most prominent characteristics of the country soil, climate and streams seen by the exploring party being described at length. Most of the territory seen is already occupied by ranchers, and they are eagerly looking forward to the time when those portions now reserved to the Indians may be opened up to settlement. Between Tongue river and Shell creek several deserted silver mines were found, which had developed very good silver ore, but not sufficiently rich to pay the great expense of transportation, though the mines had been staked off by the first explorers, and are still held for whatever they may be worth. It has been expected that rich gold deposits would be discovered in the country west of the Big Horn range, and a party of Arapahoes were taken along to point out a spring near Norwood creek, where it was said an Indian woman had taken out some nuggets of gold. The noble red men did not care to give any exact information, or were unable to do so, and Lieut. Clark did not find the expected deposits. He states, however, that he is not prepared to assert that rich mines may not yet be found in the Big Horn mountains, and the favorable indications secured by the party are sufficient to justify a more careful search, especially near the headwaters of Painted Rock and Shell creeks, while further developments of the mines already discovered near the latter may give satisfactory results.

THE *Eureka Sentinel* of Dec. 24th contains the following in regard to the superintendency of the Eureka Consolidated mine: Hank Donnelly has resigned the superintendency of the Eureka Consolidated, and his resignation has been accepted. Thos. J. Read supersedes him, temporarily. The position has permanently been offered to J. A. Porter, formerly of the K K company. Mr. Porter has been telegraphed at Colorado regarding the position. His answer is expected in a few days. It is understood that his present employment with an Eastern company will not expire until March or April. The Eureka Consolidated Directory has informed him that they will hold the place open for him up to that time. If Mr. Porter accepts the superintendency of the Eureka Con. he will also be given charge of the Albion. These are facts, and from the most authentic sources.

TEMPERING STEEL.—Mr. Adamson, at a recent meeting of the British Iron and Steel Institute, at Dusseldorf, strongly condemned the practice of endeavoring to strengthen steel by tempering it in oil, because while that practice might increase the tensile strength, it impaired the elasticity and ductility of the metal.

## The White River Mines.

From a long article in the *Visalia Delta* on the White River mines, we make the following extract:

The notable characteristic of the mines is the great number of small gash veins of gold-bearing quartz which traverse the region. There are more small pieces of float quartz scattered over the country, showing free gold, than in any region we have ever seen. The leads from which this quartz came are generally from a few inches to a few feet in thickness. The formation in which these small veins occur is silicified granite, which generally carries a large percentage of horn-blende, which in some cases is so great as to give the rock the constituent properties of greenstone.

## The Country Rock is

Very much decomposed. Tunnels have traversed this rock 100 or 200 ft. without exploding a blast. The veins which out-cropped were mainly all discovered many years ago, and have been worked in many places five or ten ft. deep. In some places they have been worked 20 or 30 ft. deep, two or three have approximated 100 ft., and one shaft has reached 112 ft. The leads seem to have been worked until the wall-rocks became compact enough to resist the force of the pick, and then, in most cases, to have been abandoned. One lead has been traced for four miles and many thousands of dollars have been extracted from it. Another lead, having different names in different parts, runs into a small slate belt on the west of the district, and has been traced, most of the distance, for five miles. These leads belong to the Eclipse mill. The Grizzly lead has been opened and skimmed over for a distance of 2,000 ft.; yet we saw no work on it 30 ft. deep, though there is a fine lead in the bottom, covered with water. The leads run the unusual course of northeast and southwest, and in many cases are so flat as to partake of the character of "hanket ledges."

## Recent Explorations

Have shown that there is a class of ledges in the district which do not outcrop on the surface, Williams & Popple, by following a clay seam in the soft granite, some 30 ft., struck as fine a small vein as we have ever seen; gold shows in almost every lump of rock; and a lump of kaolin clay, in which the quartz is imbedded, the size of an egg, will yield a hundred colors by the simple process of washing. This lead averages about 20 inches deep, lies almost exactly flat, has more than 300 ft. of drift, which runs in pay rock which will probably yield more than \$100 per ton on the average. There are some of the sulphurets, however, which do not yield to the simple process of the arastra, and it is doubtful whether mere milling would save more than \$50 per ton. Cox & Hanson have struck a very similar lead a half mile lower down the hill. A clay seam was followed more than 110 ft. before this lead was struck. Keener, Jordan & Mahuron are having some fine-looking rock crushed at a small, rattle-trap of a mill near the town. The mill is so old that the frame work is tied to the adjacent willows to keep it from falling; the batteries are very light; it is a custom mill and is said to do the best work of any mill ever in the district. There are many springs in the district capable of supplying arastra, and in view of the size of the leads, the ores, when roasted, seem well suited to that mode of treatment.

## The Gulches.

White River, East Prong, Coarse Gold, Grizzly, Gordon and Rag gulches, are the principal streams which have yielded placer gold in the district. They have been worked for 27 years—having been discovered by Samuel Jennings, Henry Hartly and Nathan Dillon, all old residents of Tulare county. The lack of water has caused the placers to be worked in a very slovenly manner, and it is confidently believed that these gulches now contain more than half of their original supply of gold. Thorough search will reveal the fact that the main channel has been missed in many cases. In most cases the dirt has been drifted out and washed with a rocker. The flats are, in many cases, 20 ft. deep, with pay gravel only on the bedrock. In such a flat as this, on Gordon gulch, the hole was pointed out, in which Mr. A. A. Brown, now of Visalia, lost his leg by the caving of the bank. Notwithstanding

## The Lack of Water

And the general neglect, which these mines betray, several millions of dollars have been extracted from them since their discovery, and yet it is confidently believed that men acquainted with the business would go there and make from \$1 to \$3 per day by employing such facilities as are now at hand. Many small tributaries of the streams spoken of remain untouched. When the main stream is abandoned the fresher water could be turned into one of these small gulches and the whole worked out in a single winter. When such an enterprise has been undertaken it has generally paid well. The great trouble is men have been impatient in grasping for sudden wealth, and have laid idle while the dry placers only promise \$1½ per day.

We found business men ready to discourage innovation and who seemed to dread the chance of competition. Competition will come, however, and the White River mines will yield up their millions for the benefit of commerce.

In passing along the gulches we found several pieces of quartz gravel that had been

thrown from the rocker which showed gold on their surface. There are, doubtless, thousands of tons of rock of this kind, in the district, which will pay for working. Mr. Jack Malthy seems to have been one of the most successful miners of the district and the philosophy of this is that he has avoided idleness. He has worked in the placers in winter and in quartz in summer—availing himself of odd spells to improve one of the most beautiful ranches in that region. He and the partners who have worked with him have taken more than \$30,000 out of quartz—\$13,000 of which was Mr. Malthy's share.

In descending Rag gulch we find evidence of a former sojourn of the sea at a higher altitude over this valley than that indicated by any formation we have heretofore seen. The chalk hills which line the banks of the gulch from its junction with Gordon gulch down, rise 100 or 200 ft. above the level of the stream; and for a short distance the underlying granite is above the water, and is, in many cases, covered with a sheet of pay ground. Only about a mile in width of these placer hills is susceptible of exploration, however, without great outlay, as the bed rock dips rapidly below the bed of all the streams.

## Layers of Gold-Bearing Gravel

Intervene between different layers of this chalk, and under it, and, with plenty of water, would offer splendid chances for hydraulic mining. In a few cases drifts have been run into these deposits and the pay gravel obtained has been washed; but the miners have uniformly stopped when they conceived their drifts to have extended as far as the proper limits of the gulch. Only one miner in that region, so far as we could learn, seemed to suspect it an ocean deposit. This gentleman is a Frenchman named Constant Horda. Under the most discouraging circumstances he has persisted in running a tunnel under the chalk, 200 or 300 ft. away from the head of the gulch, and has been at length rewarded by striking a thin layer of gold-bearing gravel, with the bed rock pitching into the hill. The age of this formation will probably class with the Pliocene formation, or possibly it may class as old as the Miocene formations of the northern mines. We heard of no fossils being exhumed from these chalk hills; but immense quantities of the bones of the American mammoth.

## Harshaw Mines, Arizona.

We take the following from the *Arizona Citizen* of a recent date:

For some time past there has been but little direct news from Harshaw Camp, and more especially from Hermosa, and many stories have been put afloat, more or less biased, according to the wishes of the parties interested.

It may be remembered that reports were circulated that there was a scarcity of water, and that the Hermosa was running on half-tides. Since the day the mill first started it has never stopped except for necessary repairs to the machinery, and since a strike was made by some prospectors on a claim above the mill-site of a stream of water six inches in diameter, there has been enough water for three mills. The company have been making regular shipments of bullion from the start, and have averaged over \$125,000 a month, shipping in November \$140,000, and will probably run it up to \$160,000 for December.

Mr. Aikman informed a *Citizen* reporter that having heard parties say that ore was already being taken out from the works already done, he took occasion to inquire of the foreman of the mine as to the present state and workings, with the following result:

For the last eight weeks there has been 300 tons of ore at the mill, 400 tons at the mine in the ore house, and 200 tons in the mine broken and ready to run out as soon as the bins would allow space to store, thus keeping 900 tons of ore constantly ahead of the mill. The greater part of this ore is being taken from developments, and the mine is by no means being stopped.

In a shaft being run on top of the hill, near the office buildings, and known as shaft No. 5, at 90 ft. the ore was increasing in value, and contains large quantities of horn silver. In all the works ore is being found, and the indications are that the whole hill is a mass of mineral. The foreman laughed at the idea of the mine being "gouged," and said there was enough ore in sight to run two years at least.

The mill and mine are both under experienced foremen, well posted in all the branches of their business and who do their work in the most thorough manner. There are about 90 tons of ore run through in a day, which is worked to within 96% of the assays, giving bullion that averages 96 and 97 fine.

This is a pretty fair showing for a 20-stamp mill, and, as the foreman of the mine said, he would like to hear of any other mine in the Territory that keeps 900 tons of ore ahead of their mill.

TO REMOVE CLARET STAINS.—Spread a little salt over the stain at the table well fresh. If partly dry dampen with a little clean rain water, and when so done the washerwoman can rinse out the stain without difficulty by not using soap. I have succeeded in getting out claret stains of long standing by wetting and rubbing on the spot pulverized chalk and salt, and laying in the sun, repeating this many days, and keeping it damp.

## MECHANICAL PROGRESS.

## Mechanics as a Science.

Although no department of science—no portion of the advancement of civilization that takes us further from barbarism—is so marked in its triumphs and so certain in its beneficial results as that devoted to mechanics, it is a fact that it does not meet its proper approval or proper reward. It is really true that the mechanic is to-day paid much less for his labor, and very much less for his ideas and practical form, than others who merely reproduce and adapt the facts and settled opinions of their predecessors. The physician, the lawyer and the theologian charge and receive for their presentation of long ago acknowledged axioms, and even of new theories, handsome returns for their trouble. They are acknowledged necessities, while the mechanic is a sort of hanger-on to our civilization—a camp follower, with no recognized rank, and merely allowed place that he may prove his fitness. Certain perquisites follow the lawyer, the doctor of medicine and the theological instructor, all of which are lacking in the case of the mechanical engineer. It is unnecessary to refer to the chances of the lawyer for rich legal fees; to mention the opportunities of the physician with his rich and hypochondriac patients; and the recognition of the religious instructor, with his faculty of dealing with the doubtful, the troubled and the despairing. From these prolific sources these professors draw their incomes, and generally without question as to their individual fitness.

But the mechanical engineer, the adapter of theoretic science to practical utility, has no such resources, and even his legitimate income is limited and its amount frequently disputed. Yet he deals with facts and realities, and not with problematical hypothesis and impractical theories. When he gives an opinion or reports a diagnosis, his statements are based on unvarying laws, which are well understood by those of his profession who are competent. On his opinion vast enterprises, involving the labor of hundreds of men for years, and the expenditure of thousands of dollars, are readily undertaken by capitalists, and it is rare that they or the poorer stockholders find themselves wrong in depending on his acumen and scientific knowledge. In short, the professional opinions of the mechanical engineer are worth all that is paid for them, seldom misleading, rarely extravagant, generally reliable. Can as much be said with truth of the professional advice of others?

Men possessing these qualifications, and on whose opinions such vast enterprises rest, ought to be well paid. It costs much in time, labor and money for a lover of mechanics to become an expert—one whose opinion and direction may be accepted as absolutely reliable, and after the groundwork of theory has been prepared there is a long novitiate of practical service before the mechanical engineer can assume the position of director. It may be said, with entire truth, that in no profession are the exactions preparatory to profit so many and the time of apprenticeship so long.

The opinions of the lawyer are subject to revision and reversal by a higher authority; those of the theologian are contracted and disputed by a hundred different sects; those of the physician have other schools to deny their conclusions, and at best are but individual ideas, liable to be set at naught by another practitioner. But the opinions of the mechanical expert are based on known and proved facts, and are similar to those of every other competent expert. On such opinions the success or failure of vast industrial enterprises may be predicted, and on them are safely risked millions of money in untried experiments.

## Sand in Welding.

An intelligent correspondent of the *Blacksmith and Wheelwright* sums up the advantages and disadvantages of the use of sand in welding, as follows: All blacksmiths know that success in welding depends almost entirely upon having the "right heat." Now, in welding large iron, say two inches or more in diameter, the heat must be applied gradually, for otherwise the outside will burn before the center is ready to weld, and the same is true of small iron, though it is not so easily observed. It is just here that the sand comes into play. By coating the iron with sand the outside is protected, to some extent, from the heat, until the interior has reached the temperature for welding; and, more than that, the sand acts as a flux, and causes the iron to "flow" at a lower temperature than it otherwise would, the same as borax or any welding compound. Consequently, with sand, a welding heat can be obtained with somewhat less care and skill, and in a little shorter time after the iron is put into the fire.

On the other hand, besides the time lost in fussing with it, the sand is hammered into the iron, it leaves a rough pitted surface which cannot be smoothed up with the hammers, and if the forging is to be finished, either by a file or machine, the presence of the sand will be made evident.

On the whole, I think that by exercising a little care in heating the iron, stronger, better finished, and much more work can be done without the use of sand or any substitute for it, than can ever be done with it.

## Danger from Emery Wheels.

As a rule, when an emery wheel bursts, the person to blame is killed in his tracks, and the maker of the wheel is censured, while it would be about as reasonable to blame the maker of a steam boiler because it blew up from low water, or a tied down safety valve, as no precautions or tests on the part of the maker can avoid accidents. As a rule, when emery wheels burst, they are not running at one-third the speed at which they were tested before they left the maker. What, then, is the reason that such wheels burst after being in use for months, and often when not running over half as fast as they were run when first put into use?

Speed alone does not cause a wheel to fly to pieces. Want of judgment, as a rule, is the whole trouble. If employers of workmen and buyers of emery wheels would purchase wheels that would cut, not grind their work, and would be content to see a wheel wear out in proportion to its cutting qualities, and would realize that time, as well as emery wheels, costs money, one cause of danger would be removed. If, also, they would so belt a wheel that in case it was crowded, the belt would slip, another cause of danger would be removed. Then, if the men who used wheels would be as careful after using a wheel a month as they were the first day, and would realize that an emery wheel can only hurt once, and that may be any time, it would be far better.

The first or original emery wheel is much to blame for all accidents. It was composed of emery and cementing material that had no cutting qualities. If it was not run fast enough to generate frictional heat enough to burn away the non-cutting cementing matter, it glazed, and all other wheels are judged by the standard that the first emery wheels seemed to set up.

I hold, as a rule, any emery wheel that will not cut like a file or a diamond—i. e., by contact—is not a good or safe wheel to use. If it will not cut unless it is run at a dangerous speed, it is not safe. When an emery wheel requires to be run at a certain speed and the work to be forced up to it, and gives off a smell of any kind when in use, it is dangerous.

If buyers of wheels would be content to see them wear away, and would buy wheels that did not require the work to be forced against them, then users of wheels would become lighter-handed, and accidents would be less frequent. Not one free cutting soft wheel in a thousand, run at a reasonable speed, comes to grief—all the accidents, as a rule, taking place with hard, tough wheels, that become untrue in use, when, in addition to centrifugal force, the body in motion is out of balance. The strain upon it will be more or less great, and will be of a character that is not and cannot be foreseen or guarded against except by the man using it. Another cause of accidents is too sudden and too rough an application of the work, as when a casting is brought against a revolving wheel so as to check, or tend to check the motion. This occasions more accidents than all other causes, and might be greatly relieved by using belts of less width and obliging the user of a wheel to be less rough.—*Iron Age*.

## Hints on How to Use a File.

Use new files on broad surfaces, and apply them to narrower ones as they get duller. This will save the files from tooth-breaking and rapid wear.

Use the edge of the file to remove scale or hard spots.

Stand well off the work for heavy filing, and let the body, as well as the arms, have motion.

Place as much weight as possible on the file (for rough filing) on the forward stroke, and use as near as possible the full length of the file.

Keep the file clean and clear of pins or cuttings in the teeth.

Vary the direction of the file marks, making them cross each other diagonally at every 10 or a dozen strokes.

For smooth filing do not exert too heavy a pressure, as it causes the file to pin.

Do not draw file until all the rough cross-filing is smoothly filed out.

Let the file make cross and recross about every dozen strokes.

Never oil a file, but chalk it, and, with the hand, occasionally brush off the old chalk and cuttings with a file-card, and apply fresh chalk.

Remove pins from the file teeth as soon as they are discovered. Pins are less liable to occur when filing across the grain than when filing lengthwise of it.

Pins form more readily with long strokes than with short ones, and with straight file marks than with diagonally crossing ones; hence a slight lateral motion should accompany every stroke. This applies even in draw-filing, except, of course, for the very last finishing strokes.—*Blacksmith and Wheelwright*.

THE GREAT CRANE AT WOOLWICH.—The largest crane in the world is nearing completion at the Woolwich Arsenal. Two thousand tons of iron are employed in its construction, and it covers a quarter of an acre. Four years have been occupied in putting the monster machine together. When finished it is expected that it will be able to lift four 100-ton guns, and one man can easily work it.

## SCIENTIFIC PROGRESS.

## An Artificial Eye Sensitive to Light.

In the course of a discussion on a paper recently read before an English scientific body by Prof. Bell, Dr. C. W. Siemens was called upon to describe and explain one of his recent inventions, which he terms a "selenium eye." The substance of his remarks is given as follows: The researches made by Dr. Werner Siemens on the cause of the extraordinary variations in the resistance of selenium to the passage of an electric current caused by light, led to the conclusion that the resistance of selenium, and probably, indeed, of all substances, varied inversely to the amount of heat which they contained; and the reason why selenium showed such extraordinary changes under the influence of light was, that under the influence it changed from one aggregate condition to another—from an amorphous to a crystalline condition; and that at the moment when this change took place a great deal of heat was absorbed, and, therefore, the specific heat of the selenium was very much increased. Dr. Siemens has constructed a little instrument to show the effect of these changes. It has the form of an eye, and on opening the lids a lens is presented to the light; through that lens the light falling upon it is concentrated upon a spot in the interior of the ball. At that spot a selenium grating is placed, consisting of five wires laid in zigzag fashion; one wire is connected to the positive, and the other to the negative pole of a battery, with a galvanometer in the circuit. These wires, lying close together, but not touching, are laid on a plate of mica; a drop of selenium is placed upon them, and this small quantity suffices to produce the desired results. The principal object Dr. Siemens had in devising it was to construct a selenium photometer; but a difficulty arose in using it for that purpose, because selenium got fatigued under the influence of light. The "eye" after being exposed for any considerable period to an intense light becomes insensitive, and the lids have to be closed; it has to go to sleep for some time before it regains its sensitiveness, and the analogy to the human eye goes even further than that. If the eye is used after having been kept in the dark for a length of time it detects the slightest gleam of light, and marks it on the galvanometer, whereas after it has been once used in intenser lights, a small gleam is utterly lost upon it, until it has again had ample rest. Dr. Siemens showed some experiments with variously colored sheets of cardboard prepared for the purpose, and the reflected light was found to cause a deflection of the galvanometer in each case, the slightest effect being produced with light reflected from a black piece of paper, and successively increasing with green, red and white, the greatest of all being produced by exposing it to the direct light of an argand burner.

## Molecular Physics.

This may be truly called the age of progress. A day in this realm of science is as a thousand years of the ancients. Day by day, new facts are being developed, which, in the hands of physicists, are instrumental in unraveling the mysteries of nature.

Physical science teaches us that matter is not continuous; it may be divided. The end of physical division is the molecule. The molecule may be divided by chemical means; the end of chemical division is the atom. Atoms *per se* are inert; their energy is derived from the imponderable physical agents, i. e., attraction and caloric. Attraction is inherent in the atoms; it can neither be increased nor diminished. It tends to draw the elements together and hold them there in a state of rest. Caloric accompanies the elements, and can be increased or diminished; it tends to separate the elements and push them outward into a state of activity.

By virtue of these two imponderable physical agents, the atoms unite in relative equivalents and form molecules, and the molecules unite and form a physical structure, in which neither the atoms in a molecule, nor the molecules in a physical structure are in an absolute state of rest, nor in absolute impact at any time, they being held at a relative distance from each other by virtue of the resultant force exerted by the imponderable physical agents, and are kept in constant activity by virtue of a reduction or augmentation of the resultant force caused by an increase or decrease of caloric in it.

Now, applying these facts in molecular physics to metallurgy we find that when iron or steel is ruptured, it is not the iron *per se* which is broken, but it is a rupture of the molecular resultant force; hence the imponderable physical agents are the prime factors, and the absolute measure of the strength of iron and steel, and progress in metallurgy means progress in molecular physics.—*Cincinnati Artisan*.

THE DIAPHOTE.—Prof. Perosino, at Mondovi, and Dr. H. E. Licht, of Bethlehem, according to *Les Mondes*, have both experimented upon Edison's principle of transmission by telegraphic wires of the forms and colors of objects in the same way as sounds are transmitted by the telephone. They hope to be able to contrive an apparatus by which two persons who are separated by an ocean will be able to see and hear each other.

## Mechanical and Scientific Progress.

It is an interesting feature of our times to note the rapid progress which has been made in manufacturing ingenuity and scientific skill in the production of substitutes for expensive or scarce raw materials and articles in general demand. It cannot be controverted that art is fast invading the domain of nature. Chemistry is enabling us to replace animal and vegetable dyes, and to form artificial gems or creditable imitations of them, which, as ornaments, answer every purpose. Mineral oils replace animal and vegetable ones for illuminating purposes, and the electric light is slowly superseding the use of noxious and costly gas. The sea tortoise no longer lures the adventurous sailors, nor are the ostriches of the desert hunted for the sacrifice of health and often of life itself. These genuine products have been so long in universal use as to become necessities of our civilization unless very similar articles can be ingeniously substituted for them.

Chemistry and science have enabled us to manufacture our own tortoise shell, ivory, and feathers, without the risk of visiting wild jungles and arctic or tropic seas for our supplies. A half dozen available substitutes for whalebone are manufactured. Ivory, so extensively in use, is superseded by celluloid. Piano and organ keys, billiard balls, hand mirrors, and handles of knives and forks, are nearly all made of this ingenious chemical substitute for ivory. In the imitation of tortoise shell, it is made into combs, card cases, napkin rings, and the like; while the pink coral, so popular with jewelers and ladies, is imitated by it to perfection.

Ostrich feathers, even the court plumes of fashion, and held formerly at prices which only admitted of their use by the wealthy few, are eclipsed in beauty and durability by the ingenious hand of skilled manufacture. A compound of silk or celluloid, spun glass, and other materials is now so cunningly combined as to be equally desirable with the genuine ostrich feathers, and a very close examination is required to detect the original from the substitute. Artificial stone and marble are made to any extent, actually rivaling the originals in strength, beauty and durability. Artificial alizarine is now substituted for the natural product of madder. It is not much more than one-third the cost of madder as originally supplied from the dye-root. We might find plenty of other similar examples to impress the fact of our subject, namely, the rapid mechanical and chemical progress of the times.

SPONTANEOUS IGNITION.—Attention has recently been called to some peculiar cases of spontaneous ignition of hydrogen in air, the phenomenon having been noticed, it seems, in factories where quantities of zinc were being dissolved in hydrochloric acid for the preparation of zinc chloride. Violent explosions took place when no flame was near, and it was eventually ascertained that the gas took fire spontaneously. It is thought to be caused by fragments of very porous zinc, which, when lifted above the surface of the liquid, during the violent evolution of the gas, and so brought into contact with hydrogen and air, act just as spongy platinum would do under the circumstances. The performance of such operations in the open air is recommended. The ignition can be shown, according to M. Hoffman, by treating a few kilogrammes of finely divided zinc with acid; the zinc dust, he says, may even ignite by contact with water.

THE SENSE OF COLORS.—At the recent meeting of the French Association for the advancement of science, M. Charpentier, of Nancy, read a paper, in which he propounded the somewhat novel theory that the sense of light and that of colors are independent. Since white light is the sum total of the various colors, it has been commonly thought that the sensation of white light was simply the sum total of the sensations of its constituent colors. On the ground that the sensitiveness of the eye for white light may be increased—as, for instance, by the previous absence of all light—without the sensitiveness for color being increased, he urges that there is a color sense as distinct from that of light as is the sense of touch from the sense of heat.

THE FORMATION OF MOUNTAINS.—Speaking of the formation of mountains, Prof. Favre, of Geneva, has said that the three systems which account for the origin of mountains do not differ greatly from each other. Those who admit the system of elevations as the principal cause would probably admit the formation of depressions as a secondary cause, while those who give depression the first place, would also admit elevation as a secondary factor. Lastly, in the system of lateral crushing there is a general depression of the earth, since there is a diminution in the length of the radius of the globe, and yet there result elevations of the ground in the midst of this general depression.

CHINESE ASTRONOMY.—In the largest library in the world, in Paris, may be found a Chinese chart of the heavens, made about 600 years before Christ. In this chart 1,460 stars are found to be correctly inserted, as corroborated by the scientists of the present day.

A NEW BATTERY is being produced, having one of its elements composed of sheet iron less than the ten-thousandth of an inch in thickness.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

SAYS the Virginia (Nev.) *Chronicle*: Silver City looks dull and desolate. One after another the Bacon, Devil's Gate, Pioneer and Hope mills have been torn down and used for firewood.

THE Eureka tunnel has been run under the mountain 1,000 ft. in two years.

Compiled every Thursday from Advertisements in Mining and Scientific Press and other S. F. Journals

## The Mining Share Market.

Mining stocks have not shown any improvement at all this week. In fact a duller week could scarcely be imagined. Even the following telegram, sent on the 4th from Virginia, did no good: Sierra Nevada has opened the stopes in crosscut No. 1, run long since on the 2300 level, where ten ft. of ore was encountered. The ore is of good quality. Sinking has been resumed in the Union shaft. The station set is in at the 2500 level of the C. and C. shaft. To-morrow drill hole No. 5 will be started from the bottom of winze No. 1 in Union. The incline winze following the ore-streak below the 2100 level in Hale Norcross is working better again to-day.

To-day stopes were opened in the ten-foot streak of ore which was struck some time since in running crosscut No. 1 east on the 2300 level of the Sierra Nevada, 1,000 ft. north of the incline. This ore is of excellent quality.

On the 1st inst. California had \$84,819 on hand, and Con. Virginia had \$105,013.

The following companies had a balance on hand December 31, 1880: Western (Contention), \$204,583.02; Northern Belle, \$170,295.50; Con. Virginia, \$56,113.19 in cash and \$48,899.94 in bullion; California, \$25,432.55 in cash and \$59,336.17 in bullion; Eureka Con., \$54,538.55; Ophir, \$51,278.09; Standard Con., \$42,216.87; Bodie Con., \$35,073.47 in cash and \$15,000 in bullion; Best & Belcher, \$22,840.94; Gold & Curry, \$13,160.68; Union Con., \$2,716.69; Utah, \$3,180.98; Benton Con., \$31,382.78; Mexican, \$3,099.57; Double Standard, \$2,393; McClintock, \$530.97; Mono, \$448.57; Tioga Con., \$7,285.11; Booker, \$4,267.22; Summit, \$6,594.05; Belding, \$1,407.90; Montt Potosi, \$1,416.06; Bulwer Con., \$1,154.16; Northern King, \$204.83; Bismarek, \$1,340.30; Caledonia, \$319.79 in cash and \$20,740 balance of assessments to be collected; Exchequer, \$11,131.11; Ward, \$107,098.53; Independence, \$3,004.25; North Belle Isle, \$14,680.97; Argenta, \$7,211.44; Mount Diablo, \$6,225.21; Jupiter, \$4,029.11; Challenge, \$6,294.63; Silver Hill, \$15,635.02; Imperial, \$15,419.52; Chollar, \$37,601.20; Potosi, \$1,799.51; Occidental, \$8,711.69.

The following companies had an indebtedness at bank or otherwise, December 31st, 1880:

Overman	\$11,328.79; Bechtel Con.	\$4,244.24;
Holmes	\$711.10; Bullion	\$2,500 hills payable,
\$251,739.16, including	\$235,000 due the Ward	
company, Sierra Nevada	\$9,990.14; Hale &	
Norcross	\$16,639.64; Betty O'Neal	\$2,495.08;
Crown Point	\$14,524.85. Lady Washington	

\$7,514.28; Alta, balance of indebtedness  
3,398.51; Belle Isle \$3,756.09; Navajo \$2,970.58  
Grand Prize \$16,777.91 (the Grand Prize mine  
shipped \$21,000 in bullion January 3rd); Savage  
\$8,414.84; St. Louis 461.18.

### Bullion Shipments.

Under this heading we give all shipments since our last issue. We will be glad to receive further reports:

California, Jan. 3d, \$41,965; Union Con.  
Jan. 3d, \$20,624; Hillside, Jan. 1st, \$2,300  
Northern Belle, Dec. 27th, \$5,857; Bodie Con.  
Jan. 3d, \$6,173; Crismon Mammoth, Dec. 29th  
\$3,190; Pascoe, Dec. 29th, \$1,670; Germania  
Dec. 29th, \$2,000; Germania, Dec. 31st, \$5,000  
Barhee & Walker, Dec. 31st, \$2,368; Christy  
Dec. 31st, \$1,001.

A YEAR OF MINING.—The New York *Tribune* prints over two pages of tabular statements of the mining industry in the United States. It says: It will be seen from the statistics we present that the previous year has not been a favorable one for speculative mining operations. Stocks have as a rule gone down, and distrust has taken the place of buoyancy and exaggerated confidence. At the same time the business, regarded as a productive industry, has more than held its own. The number of dividend-paying companies has nearly doubled. The total yield of ore is remarkable. A steady and exceeding good percentage has been earned on capital actually invested in land, machinery and working expenses, while this industry is constantly expanding, conquering almost every month new fields, and drawing to itself additional forces in the way of capital and men.

STEAM COLLIER FOR THE PACIFIC.—By a private dispatch, it is learned that Henry Villar has purchased a new large steamer now being constructed at Roach & Son's shipyard at Chester, Penn., of about 3,100 tons dead weight capacity, 341 ft. long and 39 ft. beam, for the "Oregon Improvement Company." This steamer will be used in the coal trade between Puget Sound and San Francisco. The steamer was originally intended for the Texas line. She will be ready to start for the Pacific coast March 1st.

THE California Academy of Sciences has now 173 resident and 93 life members.

CALIFORNIA.

**AMADOR.**—**DRY-TOWN.**—Amador *Dispatch*, Jan. 1: The Potosi mine has temporarily suspended operations, owing to too much water being encountered in the new shaft. They will procure a new boiler, however, and commence work again in the old shaft at the 200 level. The last cleanup at the mine yielded an average of \$9 per ton. Rumor has it that Mr. J. W. Perry has been installed as Superintendent of the Empire mine at Plymouth, the place recently filled by Mr. Mohrmerv.

**SUTTER CREEK.—Ledger, Jan. 1:** This mines are plodding along at the usual gait, and a lively spring is looked for. Sinking at the Eureka is nearly completed. In a few days tunneling will be under way. At the Mahoney things are looking well. This ore is good in quality, and plenty of it to keep the mill going steadily. In the spring a fine pump will doubtless be put in to ensble the lower levels to be worked.

Near Middle bar, which has been idle for a week or more, is to be prospected energetically. Mr. Nash, one of the owners, was expected up this week to start operations. Machinery for the proposed tunnel through Murphy's ridge has arrived on the ground. That looks like business. It is cheering to be able to report that the prospects of the Oneida mine have greatly improved of late. An ore body of good grade has been encountered in one of the upper levels. Forty stamps of the mill are kept constantly running. The mill is expected to be in full operation this Thursday evening. A patent has been received for the Plymouth Rock quartz mine and mill site; John Evans and Philip Kearbes claimants. This mine is located a short distance from Plymouth.

BUTTE.

**NEW QUARTZ MILL.**—Oroville *Mercury*, Dec. 31: John Rhodes and J. B. Treadwell have made arrangements with Augustus Tache, and will put up a mill on his quartz ledge. This ledge is situated a short distance above Oregon City, and as yet is only partially developed. An incline has been run to the depth of 40 ft, following the vein down, and a shaft has been sunk on it to a depth of about 40 ft. The vein is about 4 ft wide, and is quite rich.

**THE SAVERCROFT MINE.**—Butte Record, Jan. 1: Mr. C. W. Reed, of Sacramento, Superintendent of the Savercroft mine, came up last night. Mr. Reed states that the new 40-stamp mill is nearly completed, it having been the intention of the company to put it in operation on January 1st, but owing to the recent storm, the workmen were interfered with to a considerable extent. The mill will be run by water power, and is so located that the rock can be brought to the mill at little expense. Mr. Reed states that during the coming summer he intends to show some of the country the workings of the mill as they are now.

THE JACKSON.—This new mine, in a new mining locality

seems to have a brilliant future before it. The company has been at great expense. The first thing to do was to get water to the claim; in order to do this the company has put in a saw mill, which is turning out from 15,000 to 20,000 ft. of lumber per day. As this mill is located in excellent timber and is on the Lassen trail, it will afford a supply of excellent lumber for the southern part of Tuolumne county and the northern part of Butte. The company has exclusive control of the water, which exists in great abundance during the entire season. The company

Mr. Squires, Superintendent of the company, says that it is his intention to improve the old Lassen trail and make the ingress and egress of the mines over that route.

CALAVERAS

KNOX & OSBORN MILL.—*Calaveras Chronicle*, Jan. 1. The 20-stamp mill, with the rock breaker and the Frue and Blatchley concentrators, all running in tip-toe order. The entire machinery is run by a Miners' foundry water wheel, requiring only 45 inches of water. The mill has a capacity of 40 tons per day, and the rock breaker can crush 80 tons in 10 hours. Four Frue machines take care of the sulphurets from 10 stamps, while the Blatchley machines consist of 8 tables, each taking care of 10 sulphurets from the other 10 stamps, and it is thought can do the work for 20 stamps. The mill is a good one and is doing very satisfactory work. From 12 to 15 men have been constantly at work in the mine since our last report keeping the mill supplied with quartz. It requires 2 men to deliver the quartz at the mill—2 in the day and at night—5 men, with 1 man on the crusher, tend the mill at all night. The mill is in the best of order, especially in the line of the west tunnel, which is the most advanced of any work in the mine. Several important outside improvements to this splendid property have been made since our last account, chief of which is a wagon road from the mill to the head of Alexandria gulch, where the company has been getting out soapstone, with which to erect a chloridizing furnace. Lastly, a charcoal retort, with capacity for 350 barrels, has been erected, and 350 barrels having just been burned. This is the second retort of the kind ever put up in California, the first having been put up some years since by Mr. Osborn in Napa county. The charcoal from these ovens or retorts is much superior to that procured from mound pits. Everything in and about the Knox & Osborn mine presents life and activity. Col. Robinson, the Superintendent, is in the mill, and Mr. Allen, the manager, is in the mine in mining operations; while Messrs. Allen & Osborn, who have charge of the mill, are equally experienced in their line.

INYO.

**SNEETING.**—*Inyo Independent*, Jan. 1: The last run of the Defiance furnace at Darwin, which last week shut down for a short time, yielded 4,422 bars of base bullion. Counting the average weight 35 lbs, this would amount to nearly 158 tons. During 48 hours on the 23d and 24th of December 653 bars were run out, of 25½ tons weight. The furnace was kept right along afterwards. It is the best furnace only and the yield in that length of time is the best yet attained in this county, or probably anywhere else with a furnace of the same class. Upon one occasion at Cerro Gordo a run of 305 bars was accomplished in 24 hours, but for some cause or other the furnace was cooled off the next day.

DEEP SPRINGS.—W. A. Greenly was in from Deep Springs a day or two ago, and reported that all the mines being worked "look a great deal better than the owners expected"—which is saying considerable. Samples of ore from a new location on the Indian Scout ledge, assayed by Mr. Woodbush, yielded an average of \$58 per ton.

**PANAMINT.** The business of mining and milling has been steadily carried on in Panamint for some time past to the handsome profit of chloriders and all interested. Many of the unpatented mines are being relocated. A important strike is reported in the 900 level of the Wyoming, samples of which have been sent to the old company at San Francisco. Some Eastern parties recently there propose either buying the big mill of the Surprise Valley Mill & Water Co. or else putting up entirely new works.

**MARIPOSA.**—MERCEZ HYDRAULIC CO.—Mariposa Gazette, Jan. 1: The extensive works of this company at this site at Red Bank, near Merced, have been completed, and the plant is in a prosperous condition. We learn that the late rains have given an ample supply of water for all purposes of hydraulicizing the rich belt of dirt and gravel which is almost inexhaustible, at least for many years to come. The splendid machinery which comprises a large-sized giant, pipes, penstock and derricks, is all first-class; constructed and placed upon the works by the same hands, and under the same management, as the works at Merced, and under the same management, as the works at Col. Swadley. The company at present employ a force of 20 men, which number will probably be in-

creased as the mine develops and increases its resources, which it has at command.

**MURRAY'S PATENT SLUICE BOX.**—Murray's sluice box, for which he has recently obtained a patent, is commanding public attention, and is said to be an important improvement on mining implements, by which gold is saved from the dirt and gravel, which as a general thing a large percentage lose. One of the excellent features of this invention is that it will dissolve all clay formation of a putty nature that is susceptible of being dissolved by application of water, a difficulty which exists in most of the placer mines.

#### NEVADA.

**SEABASTOPOL MINER.**—Grass Valley Union, Dec. 30: The second clean-up of rock from the Seabastopol mine has been made at Sothern's mill, from a run of 90 tons, which yielded \$22 per ton, not including sulphurets, which at the first clean-up went at the rate of \$50 per ton. The yield of this crushing is a decided improvement on the first one that was made, but it does not yet come up to what is expected from the rock when the regular pay chute, which is now driven for, is reached, and which is found in the upper level. There are now about 100 tons of quartz on the dump at the mine, of the same character as the above, which will be bailed to the mill as soon as the condition of the weather and roads will permit. The Seabastopol is showing very well so far as developments have been made, and there is every present encouragement that it will prove a good mine.

**RICH QUARTZ IN THE ROCKY BAR.**—More rich quartz has been struck in the Rocky Bar mine, on the upper or Rocky Bar ledge, within the past week, and it comes from the vicinity where the rich specimen quartz was found some months ago. Last week the first of this good rock was found, and on Tuesday several boxes were taken out and crushed in the batteries of the mill. It is not known whether it is going to turn out as rich a strike as the former one, but it demonstrates that that portion of the mine has not been exhausted of its treasures.

**A FINE CLAIM SECURED.**—Jan. 20: The Cowger Bros., whose claims are situated at Snow Point, above Moore's Flat, yesterday brought down \$9,000 worth of gold dust from their claims, the result of a recent clean-up. Among the batch was a lot of specimens, some of which were very handsome. We hope to hear of other claims, now that water has come, bringing in their regular monthly harvests of gold.

**MEXICO SALT POKES.**—*San Francisco*, Jan. 1: The Mackeral Basin hydraulic mine, located at Scott's flat, in this country, changed hands last week, Messrs. Wheeler & Rogers, who have been mining for years out on Rattlesnake creek, being the purchasers. Parties well acquainted with the property speak very highly of it, and as the new proprietors are both good practical miners, and will proceed at once to place the mine in the best working condition, we hope to hear soon that they have added another to the list of dividend-paying mines of the country.

#### PLACER.

**NEW MILL.**—*Placer Herald*, Jan. 1: The new mill on the Auburn and Rock Creek mine has been started up and works first rate. The large pile of ore taken out of the mine while the mill was building is being put through, and from all indications it is going to pay well. Reports say that a strike has recently been made in this mine of uncommonly rich ore.

The Conrad mine, on Duncan hill, continues very rich. A crushing of about 50 tons of rock taken out in extending the drifts is about to be put through the Pelster mill. The rock taken out continues to show a great deal of free gold. A party who was at the mine a few days ago tells us he saw a piece nearly as large as a man's head taken out that day the last time he was there.

The Rising Sun quartz mine at Colfax, the banner quartz mine of the county, is undoubtedly entitled to that distinction. This mine has long been among the list of dividend payers, and from the best accounts at hand it seems to be getting better as it is further developed. We were shown a specimen of the rock that had recently been taken from the 500 level which was surprisingly rich. It showed abundantly of free gold, and otherwise possessed characteristics indicative of the very best kind of rock. This is a good mine, with good works and is ably managed.

**NORTH RAVINE.**—*Cor. Placer Herald*, Jan. 1: T. J. Hunter is having a lot of very rich ore crushed at Eaton & Hammond's mill, which, by the way, deserves special mention. Mr. Eaton is well known as the former owner of the St. Patrick mine. James Hammond is the son of the patentee of the mill which is known as the Hammond patent. The mill is a 5-stamp one. It is run by water power from North ravine. The wheel is an overshot 10 ft in diameter. As far as my judgment goes I consider it far superior to the old stamp mill in use. Mr. Fancher has an improved gold-saving machine, through which the water passes from the amalgamator. This invention is Mr. Fancher's and should be used by all mills not having pans. The Crandall mine is being re-opened by J. R. Mains, with promising results. This is one of the oldest quartz mines in the county. The old tunnel is being re-opened (the outside cut having caved in) which is 150 ft in diameter, and will tap the old shaft about 90 ft from the surface. At the present writing the stamps at Pelster's mill are still. Mr. Goode is going to start up his mine, which is the one immediately below the Mark L. mine, which adjoins the Hunter mine. This mine is full of free gold, and is undoubtedly very rich. On the north side of the ravine, Bald hill, Hunter has bonded his extension to his mine to a Reno company, the members of which have arrived to commence operations. The Sacramento mine is owned by B. Frank Smith and Warren Starr, of Sacramento. For some reason they are letting their mine lie idle, but rumor has it they contemplate putting up a 10-stamp mill.

#### PLUMAS.

**THE MONTE CRISTO.**—*Plumas National*, Dec. 25: Capt. Smith and Mr. Parsons came down from the Peak on Tuesday, and gave us a call. Work is booming along, us usual, and the old prospects are steadily increasing. The main tunnel is being steadily driven forward, but has lately been "going slow," as the tunnel had to be driven directly through a bowlder for 57 ft. The workmen broke through a few days ago, however, and have since been in pipe-clay, with 8 inches of rich blue gravel above the track, and, as no shaft has been sunk, it is impossible to say how much is below them. The gravel prospects from 10 to 20 cents to the pan. Fine gravel is also being developed in one of the west crosscuts, and the outlook, generally, is first-class. The drill works well, and the "bowlder" spoken of gave a good opportunity to test its merits. With ordinary hand drilling it would have been an endless job to pass through it. The water still continues to run steadily from the tunnel, and lately the volume has not decreased. This strike of water will prove valuable, as there is enough of it, if a reservoir is provided, to wash large quantities of drift dirt, and, if held out, the necessary tanks will be built. The managers of the Monte Cristo are in high spirits, and confident that during the run of water, next spring, they will prove the mine to be one of the "bonanzas of the land."

**ANTLOPE.**—*Oreenville Bulletin*, Dec. 23: This company is now running a tunnel to tap their ledge, near the Arcadia.

**SOUTH EVERA CON.**—The new mill is almost completed and will be ready for work to commence in a few days.

**OLD STRIPS.**—The mill is running steadily and the Lawrence ledge is opening well, showing large resources of good ore.

**INDIAN VALLEY.**—Only about 25 ft more of solid rock are to be cut through to complete the tunnel, and then pay rock will be taken out.

**PLUMAS NATIONAL.**—The new furnace is now ready to start, and about 600 tons of sulphurets are on hand ready to be worked. The Erie concentrators will save about 90% of the sulphurets. Maj. Rodgers, the Sec'y of the company, will be here this week.

**GREEN MOUNTAIN.**—The 2 fine mills of this company have been running steadily, and the storms have not interfered with their working, so well arranged is everything connected with the ditch and tramway. Last Saturday

pay ore was struck in the face of the No. 5 tunnel, or present main level of the mine, indicating the approach of the main pay chute of ore in the shaft above. This is but another evidence of the permanency and success of this splendid property. There is no difficulty in supplying an abundance of ore for both mills. The new tramway transports in 10 hours are enough to run the mill for 24 hours.

**CURKOREK.**—The almost incessant storms of the past 2 weeks have rendered it very difficult to haul ore to the mill. The hoisting works are being rapidly arranged, the pump is in place in the shaft and a double force of mechanics will probably be put on to have the machinery going by Saturday. A donkey engine has heretofore been adequate to hoist both the ore and water, but since the late warm rains the water has so increased that heavier machinery is necessary.

#### SIERRA.

**BLACK JACK MINE.**—*Nevada City Transcript*, Dec. 20: On Thursday last a snowslide occurred at the Black Jack mine, Sierra county, which completely demolished the blacksmith shop and nearly crushed the mine. The works are situated at the base of a mountain which rises very abruptly for a distance of about 500 ft. The rain falling upon the snow, which was some 8 ft deep, made it so heavy that it was precipitated into the flat, carrying the building, trees, boulders, etc., in its headlong course. Fortunately the mill was off the line of the slide, and escaped injury.

**HOO CANYON.**—*Mountain Messenger*, Jan. 1: Work is to be pushed on the Uncas claim at Hog canyon. The company has driven a tunnel at the old mill, and propose to drive it ahead until they strike serpentine. There is much wealth in that canyon yet.

**GOLD BLUFF.**—We are informed that they have struck a ledge of good ore, 4 ft wide, in the upper workings of the Gold Bluff mine. The existence of this ledge was not suspected until lately. As we are informed, the ledge, when worked years ago, seemed to pinch out, and was lost, and by failure to drive a tunnel in the right direction, was discovered. Mr. Van Slyke, the present owner of most of the mine, had different ideas from the old owners, and proved them correct by running in different directions, with the above result.

**HASKEL PEAK.**—This energetic and persevering mining company, Sierra City, has sunk a shaft 828 ft from the mouth, and at the face of their main tunnel, 45 ft of bedrock, passing through 30 ft of pipe clay and 15 ft of washed quartz gravel, bedrock pitching steep. Thus far there has been no gold, but everything indicates they are in the rim rock. A new contract of 200 ft has been let. When that is completed, sinking will be resumed, and so on *ad infinitum* until either a gold channel is reached, or the last spark of hope has been extinguished in the hearts of the determined prospectors, who are so vigorously engaged in the development of the mineral resources of eastern Sierra.

#### SISKIYOU.

**RIVER CLAIMS.**—*Democratic Times*, Dec. 31: The river claims on the Klamath, in Siskiyou county, have yielded well during the past year, and in some cases immensely. Several excellent quartz ledges are also being worked in that county at present. Unusual activity in mining now exists there, and it promises to increase during 1881. A new era in the prosperity of northern California is dawning.

#### TUOLUMNE.

**ITEMS.**—*Sonoma Independent*, Jan. 1: A strike was made in the Rough & Ready graveling, in Table mountain, and, very recently, which is said to be a big thing. New gold has been discovered in the Keltz mine, and operations will be carried on with more vigor than ever. On the 19th ult. A. Colby & Co. are said to have taken out 50 ounces of gold from the Big Nugget claim, on Oliver Cowan's premises. The vein is a continuation of the Bonanza mine. Supt. Wetmore is busily engaged in repairing a big cave in the Golden Gate mine. The sound of the busy stamps can be distinctly heard in Sonoma during 1881. Mr. Van Slyke, now prospecting general companies of Chinamen, are engaged in mining over the old tallings on Woods' creek—often coming on "new dirt" that pays very handsomely.

#### NEVADA.

##### WASHOE DISTRICT.

The following statements, made by Superintendents, are for week ending Jan. 1:

**YELLOW JACKET.**—At the Suro tunnel level we have extended the northeast drift to a point 90 ft from the shaft, or to the proposed line of the tunnel. We are to-day making a turn to the north 15° west. The ground has been more favorable for speedy work. We are employed in the shaft easing around the timbers and doing some repairs on the incline from the old south shaft.

**CALIFORNIA.**—During the past week there have been extracted and sent to the mills 279 tons of ore of the assay value of \$24.28. During the week there were \$41,065.04 in bullion shipped. On the 25th level we have commenced the drain and enlarging the connection of the joint Ophir east crosscut has been extended 37 ft, and the joint Union Con. east crosscut 17 ft. On the 2500 level the south drift from the Ophir level has been extended 33 ft, and the joint Ophir upraise 15 ft.

**UNION CON.**—During the week 212½ tons of ore have been taken out and sent to the mills; assay value, \$20.03. During the week bullion to the value of \$20,624.75 has been shipped. On the 2500 level the joint Mexican west crosscut has been extended 16 ft; joint Mexican west crosscut 10 ft. A station is being cut out at the bottom of No. 1 winze.

**SIERRA NEVADA.**—On the 2300 level the incline has been extended 20 ft; total, 420 ft. On the 2500 level the crosscut has been advanced 25 ft; total, 70 ft, and the joint east crosscut 27 ft; total, 179 ft. During the week 131 tons and 800 lbs of ore were raised.

**MEXICAN.**—On the 2500 level the joint Ophir east winze has been sunk and timbered 14 ft; and joint Union Con. east crosscut 20 ft.

**UTAH.**—Since last report the east drift on the 2150 level has been extended 15 ft. On the 1950 level we have run a diamond drill 190 ft in an easterly direction, and, on account of the breaking of the drill-rod, were obliged to discontinue.

**OPHIR.**—On the 2500 level the joint Mexican east winze has been sunk and timbered 14 ft; the joint Mexican west crosscut 21 ft, and the joint California upraise 15 ft. On the 2300 level the joint California east crosscut has been advanced 37 ft.

**CON. VIRGINIA.**—During the week 999 tons of ore have been extracted and sent to the mills; average assay, \$37.45. On the 2300 level the south lateral drift has been advanced 17 ft.

**UNION SHAF.**—Cutting out tank-pit at the 1600 level, boulders on 2300 level, casing timbers at 2400 station and reinforcing strapping plates on the pump rod.

**C. & C. SHAFT.**—During the week the shaft has been sunk and timbered 10 ft; total depth below the 2300 level, 194 ft.

##### ESMERALDA DISTRICT.

**REAL DEL MONTE.**—*Esmeralda Herald*, Jan. 1: The foundation of the surface hoist, which commenced working on Sunday last, has been braced up and made secure for the present. When the 750 bob is completed a few days hence, another plunger pump put in and connections all made, the surface bob will be relieved of a good deal of the work now performed, and Supt. Tyrrell thinks it possible the foundation may last some months yet.

##### GRANTSVILLE DISTRICT.

**THE CENTENNIAL.**—*Oranville Bonanza*, Jan. 1: Work on the Centennial is steadily going ahead, with the most flattering results. The ledge in the bottom of the shaft is the full width of the same, but the ore is of a better character than any yet taken out. It is the intention of this company to build a 20-stamp mill the coming summer.

**THE ALEXANDER.**—Work in the Alexander mine is going ahead with the usual vigor, and the great extent of the ore bodies is fully realizing the anticipations of the management. A large and commodious ore house has recently

been erected, from which the ore is sent to the mill with great dispatch.

**THE BROOKLYN.**—The Brooklyn is furnishing an abundant supply of rich ore, and daily improves in extent as developments progress. A convenient ore house has been erected at the dump.

**THE ISA.**—This is a mine of great promise as a bullion producer, and is located on the great ore channel of the district. Thomas K. Murphy, the owner, is at present engaged with a force of men sinking 2 shafts 500 ft apart, which are producing payable ore.

**THE POTOSI.**—In the Potosi the work of sinking progress rapidly. The bottom of the shaft is in sulphur ore of a high grade, and the mine promises to be not an unworthy rival of the Brooklyn.

**THE HOMESTEAD.**—A very promising sulphuret formation has been struck in the Homestead below the water level. An incline is being sunk through this formation and the mine is improving every day.

**THE ALEXANDER MILL.**—The Alexander mill still runs along without a stop or a break, and its bullion product for the month will be larger than it has been for many months.

#### I X L DISTRICT.

**BAYFIELD CO.**—*Eureka Sentinel*, Dec. 20: Capitalists, both in Chicago and New York, are endeavoring to make negotiations to purchase the I X L mine, and to develop it. They have also offers from different sources to erect a mill and reduction works on shares. The mine is certainly a good one. At present the main shaft is down 215 ft, and drifting has been begun at this point, and at last accounts the mine was looking splendidly.

#### LEWIS DISTRICT.

**ANOTHER DIVIDEND.**—*Silver State*, Dec. 23: The Star & Grove mining company, of Lewis district, has declared another dividend of \$20,000, payable immediately. The mine is proving to be one of the best in the State.

#### MINERAL HILL DISTRICT.

**WORK.**—*Cor. Eureka Sentinel*, Jan. 1: No great amount of mining work is being done at present. The Austin and Spencer Co.'s are employing a few men, and it is not probable their force will be increased during the winter. There are quite a number of private parties working claims on the hill, with very good results. A shipment of ore from the Friday mine last week returned a handsome remuneration to the proprietors, and it is said another shipment will shortly follow.

#### OSCEOLA DISTRICT.

**OSCEOLA DISTRICT.**—*Ward Reflex*, Jan. 1: Boone Tilford and partner, we learn from Wm. Taber, who returned from Osceola a few days ago, are taking out \$22 a day from their placer claim in Dry gulch. They get enough water for their rocker by molting snow. If their ground holds out, they are liable to make a "killing."

#### SILVER CANYON DISTRICT.

**STARTED UP.**—*Ward Reflex*, Jan. 1: The mill at Silver Canyon, we learn from W. McGill, started up, on the 27th of December, on ore from the Sadie L. mine. In the event it works the ore of that section successfully, all old White Piners will begin to brace up. The result will be watched with interest.

#### TAYLOR DISTRICT.

**DEVELOPMENT.**—*Ward Reflex*, Jan. 1: During the past year considerable quiet work has been going on in Taylor district, situated 12 miles easterly direction from Ward. The developments made have been of such a satisfactory nature that Robt. Briggs, W. N. McGill and W. G. Lyons have concluded to put up their mill near the head of Steptoe creek for the purpose of working ore from mines in the district. All arrangements have been made and the mill will be erected as early as possible. Taylor is by no means a new district, the first location having been made within its boundaries quite as early as in Ward. The first locators looking either in means or energy the camp languished, and at one time was entirely deserted. A few having a knowledge of the richness of the mines did not propose that the district should be abandoned. The mines becoming relocatable, the present owners were not slow in taking advantage of the opportunity thus offered to take them up. From the Self-Cocker, Sunrise and Brech-Loader 35 or 40 tons of ore have been shipped lately to Salt Lake City for reduction, that averaged over \$300 a ton. Jas. Hixon and Chas. Peck are at work on the Sunrise, and taking out ore that will pay to ship. They are also working on shares. Work will soon be commenced on what was once known as the Prince mine, now owned by Briggs & Lyons. Three thousand tons of good milling ore, it is estimated, is in sight in the district. A large percentage of the ore is as rich as they find it anywhere, and well calculated to make men with any knowledge of mining take hold.

#### UNION DISTRICT.

**ATTRACTING ATTENTION.**—*Cor. Eureka Sentinel*, Jan. 1: This district is attracting considerable attention, and seems to be having a boom. Quite a number of men have gone, and others are going in daily. Work will be actively prosecuted on the Independence, Grand Treasure, Victoria, Star and some of the other principal mines during the winter. There is a proposition to consolidate some of the mines in Union district and erect a furnace, but whether it will be consummated this winter is not yet apparent. It is to be hoped that something of the kind will be done, and then a boom in Union will set in earnest; and when it does we predict a more rapid increase in population than has been witnessed in any mining camp for several years. The mines are there, and all that is needed is a little capital, and the sooner some enterprising individuals or company take hold the sooner prosperity will come to the camp.

#### WARD DISTRICT.

**MARTIN WHITE.**—*Ward Reflex*, Jan. 1: Another crosscut has been started north in the tunnel 2,900 ft from the mouth. The crosscut, 2,400 ft from the mouth, is looking favorable. Considerable water is at present coming in.

**BONDEN ORE MORE.**—From Dave Felsenthal we learn that the Munroe & Linton mine (Credit Mobilier) has been bonded again; this time to Omaha parties, for \$40,000. The sum of \$1,500 is to be paid on the 1st of March and the remainder of the cash for the year. This is the 3d time that these mines have been bonded, but it is no fault of the mines that they were not sold.

#### ARIZONA.

**OLDBEY MINE.**—*Silver Belt*, Dec. 26: The Belgium mine is 14 miles from Oldbe, on a huge vein. There are several openings on it, from all of which ore has been taken. In the combination shaft, on the northeast end of the location, the north wall has been cut into about 3 ft, and the line of the ledge shown on the ends of the shaft is as true as a rivet. Some of the ore taken out carried 30% of copper, and assays of 100 ounces to the ton have been had. The ore is of a high grade, and the mine is well developed. A large price, and thought Doc. Wilson, who sold it, had the best of the bargain, but Mr. Helling's appears to have known best. Two hundred and thirty tons of the ore have been worked by the Oldbe City M. & M. Co., and the product has been, with the present clean-up, almost \$30,000. It is, for a small mine, a perfect marvel. The mill is totally unable to keep the dumps clear. A 10-stamp mill could not do it. The vein is 3 ft thick. In the level are 3 veins, each 2 ft thick; all of them containing good milling ore, and the ore next the footwall is as rich as anything yet discovered in the mine. Mr. Helling's ships, this week, \$5,350 worth of bullion. The Great Republic, owned by Larro & Ford, on the south side of the Pinal mountains, is producing excellent ore. The pay streak is 20 inches wide.

**ALICE ORE.**—The plans for a 10-stamp mill is running now on Alice ore. The plans for a 10-stamp mill for the Centennial company have arrived. Mr. Rice, who, with Mr. Palmer, has the contract for erecting the mill, helped to arrange the details of the plan with the Pacific Iron Works, and the result is that the company will have a perfect mill. There will be a Howell & White roaster, and the most approved style of kiln for ore drying. The new road to McMillen, via California mine and Bick's camp, is finished, and last Wednesday they commenced to haul

ore over it. They have struck ore in the La Plata of precisely the same character as the Mack Morris is producing. Both mines are on the same ledge.

**MESSEURS FLAVERS.**—*Arizona Sentinel*, Dec. 25: Mr. L. J. Shaw came in from the Mesquite placers yesterday, and reports that the late heavy rains had interfered somewhat with dry washing for the past week. Some very rich strikes have been made there in the last few days, and more attention has been paid to quartz claims than heretofore. Messrs. Thurlow, Downey and Lyons are still taking out an immense amount of gold from their claim. This is one of the richest claims in the district, and will make millions of dollars for all parties interested. Mr. Shaw has just finished the assessment work on the Essex, and at 15 ft down in the shaft struck some very good looking quartz carrying free gold. He will still continue work on this mine and put down a shaft of 100 ft.

**TIPTOP DISTRICT.**—*Arizona Miner*, Dec. 31: Jake Marks, who went out to the Tiptop a few days since for the purpose of meeting capitalists from San Francisco, has returned and gives us the following news from that section: According to understanding, he met Mr. Charles Foreman, of the Overman mine, in Virginia City, who examined the various mining properties in the district, of which he was favorably impressed and may negotiate their purchase. Mr. Weber, of the Tiptop mine, has bonded the Buena Vista lode in Humburg, Silver Mountain district, in the sum of \$30,000, and put a force of men at work running tunnels and a shaft 100 ft deep. He is enthusiastic over this property and will give it a fair test. The Tiptop mine is looking extremely fine, yielding good ore, while the mill is still running, turning out bullion. Never has the Tiptop mine and camp presented a more favorable appearance than at the present time.

#### IDAHO.

**BAY HORSE DISTRICT.**—*Yankee Fork Herald*, Dec. 23: The Liverview, a location made in '73 by Frank Milhoan & George Harland, is developing into one of the most promising in Bay Horse district. The owners of the mine since leased it to E. K. Davis and Thos. Higgins for a period of 6 months, and the ore vein, since they commenced work on it, has widened out to 5 ft, 30 inches of which is solid galena ore carrying from 300 to 1,500 ounces of silver per ton. Four men are at work in the mine, taking out from 3 to 5 tons of ore per day, 2 tons of which is high grade. The Post Boy is improving with development, and is getting a large quantity of high grade ore. The Kansas is getting out the usual fine quality of ore for which that vein is noted. The Utah Boy and Silver Wing are also turning out much good ore. Kelley & Watson are working their locations, and fine ore in abundance is accumulating on the dump. Taking the mines together and there will be much work for the smelter when it starts up in the spring, and Bay Horse will be a lively camp next season.

The Salmon river mining camps will all take a big jump upward next season. The mines have developed sufficiently the past summer and fall to guarantee this.

The mines on Squaw creek, a tributary of the Salmon, and about 22 miles south of Bonanza, are producing much ore this winter, which will be reduced at the Kinnikinnick smelting works.

#### MONTANA.

**SILVER BOW ROASTER.**—*Butte Miner*, Dec. 29: The Silver Bow mill, which has been closed down for the past week to permit of the proper connections being made between the machinery of the old building and that of the room in which the Howell roaster has recently been erected, will resume operations to-day. The mining interests of the camp will be materially benefited by the Silver Bow roaster. The character of much of the ore produced from a certain class of prospects, while not adapted to the free mill process, is nevertheless, unavailable for cheap and efficient smelting. It is on this account, and the fact that the Silver Bow Co. has provided facilities for its treatment it may be expected that a number of prospects which have heretofore been idle will start into operation.

**MAGNA CHARTA.**—The east and west drifts from the face of the north crosscut are being vigorously forwarded on a fine body of ore. Stopping has been commenced, and the necessary preparations are being made for the extensive extraction of ore as soon as it may be required for treatment. At present only a small force of men is employed, and the production is as yet limited to about 6 tons per diem.

**MOULTON.**—Affairs at the Moulton are decidedly animated. The frame work for the hoisting works is almost completed, and the erection of the building will be begun this morning. The site for the new mill has at last been definitely determined upon.

**BELL.**—The Bell is constantly adding to its fame as a producer of high grade ore. The ore which yesterday came out of the middle shaft was marvelously rich, many of the pieces being covered on all sides with native silver. The Bell is assuredly the richest property in the camp, and one of the most valuable in the Territory, for not only is the ore rich but the vein is unusually wide and possesses every characteristic of permanency, and what is equally gratifying the ore improves in quality with the attainment of depth.

**ANSELMO.**—The main shaft has attained a depth of 170 ft. The new shaft is being sunk with expedition and is about 110 ft deep. The stopes in the 70 level, which connect the 2 shafts, are being vigorously worked and are yielding a fine quality of ore, as is also the drift running west from the new shaft at a depth of 70 ft. Some shipments of ore are being made to the Silver Bow mill.

**STEVENS.**—The ore in the bottom of the new shaft is improving daily. The walls continue smooth and regular, and the ore body is compact and clean.

The ore in the old Alice mill is being chloridized to a higher percentage than ever before. The chlorination for the past month has averaged 0.1% of the assay value—a most excellent showing and one that is seldom beaten in any camp, the character of the ore being good.

The new Alice mill was started into operation on Monday and will hereafter run continuously.

DONNELLY, CLARR & LARABIE yesterday shipped 6 bars of Elkhorn bullion valued at \$2,000.

#### OREGON.

**ITEMS.**—*Democratic Times*, Dec. 31: There is a full head of water at the Sterling mine, and Supt. Ennis is happy. Chappel & Co., at Star gulch, are enabled to run 6 hours a day with the aid of their reservoir. Hays & Magruder started their pipes agoing the forepart of the week, and are moving the dirt at a lively rate. It has been raining hard in Josephine county, and the miners have plenty of water and are busily at work. A good run seems prospective. Nearly every miner in Jackson and Josephine counties has more or less water available, and all are making the best of it. The season opens quite favorably, with pleasant weather prevailing all the while, and visions of gold dust haunt the hopeful delver of the earth.

#### UTAH.

**SILVER REEF.**—*Miner*, Dec. 29: The Stormont mill resumed operations the latter part of last week, and the stamps are again getting away with the usual amount of argentiferous sandstone. The bullion product of Silver Reef for the year 1880 may be estimated at over \$1,050,000, an average of nearly \$50,000 to the single stamp. This is more solid silver to the stamp than any other camp on the coast can boast of. The cage for the new Buckeye shaft was completed last Friday, and on its first trial worked to a charm. Mr. Walker, the company's blacksmith, is an expert mechanic, and we have seldom seen a job perfected in better shape than the iron work of the new cage.

**MILL CLEAN-UP.**—*Salt Lake Tribune*, Dec. 23: Yesterday Mr. Alexander Graham, of Cedar Falls, Iowa, who has been engaged in running the Tintic M. Co.'s mill, brought to the city 26 bars of silver bullion, valued at \$20,000. The mill is the old Wyoming, and the ore was mostly obtained from the Northern Spy, a new prospect opened in October. The product of the mill is silver, and particularly so to Mr. Graham, who claims to be a novice in mining.

## Irrigation and Water Rights.

State Engineer W. H. Hall, has made to the Governor the following supplemental report on the water question in California:

Conflicts of interest, for whose adjustment the present laws afford no adequate method, keep matters connected with water rights for irrigation in such an unsettled condition that there is no basis of credit upon which to raise money for the construction of irrigation works, and no certainty in farming with irrigation, except in cases where all rights can be monopolized or brought under one control, and these instances are few.

Two general classes of conflicts have made themselves known throughout the counties where irrigation is now practiced, namely:

Conflicts between rival appropriators of water, or claimants by prescription; and,

Conflicts between appropriators, or claimants by prescription, and riparian owners.

Of course there are an infinite number of sub-varieties of cases which come up under each of the general classes.

In the San Joaquin valley, not only are these conflicting interests present, but another element will soon make its appearance (indeed it has already), and we will have inevitably, unless the State controls and directs the diversion of waters from the San Joaquin river and its tributaries.

The worst conflict of all, namely: that between the appropriators of waters for irrigation, and the navigation interests on the main river.

### Proposed Settlement of Conflicts.

The question is, how to do away with this clashing of interests.

To settle conflicts between appropriators or claimants by prescription, it has been proposed—and I find the plan advocated by many worthy people in the irrigation regions—that the State take charge of the whole matter of irrigation—condemn and pay for all existing rights to water, for the public benefit, construct the works of irrigation, and sell the water.

As a variation to this, others advocate an apportionment of the waters, after being condemned for the public good, and paid for by the State, to the lands requiring them.

And again, other people would have all water rights condemned, but paid for by the lands to be benefited in each instance.

I do not think any such plan is feasible, and for the following reasons:

First—The outlay for the satisfaction of existing water claims would necessarily be so great that the State could not be brought to undertake the settlement.

Second—If the State should undertake the construction of irrigation canals, or works of irrigation proper, her enterprise would fail of success, and involve her in enormous expenditures of money.

(See Chapter V, of Part IV, Report of State Engineer, January, 1880.)

Third—If the State should reapportion the waters, the supply would not be sufficient for all, and the conflict would be as great as ever.

Fourth—The conflict between users of water for irrigation and claimants under the riparian principle would still exist, and could not be done away with by condemnation—for the field is immeasurably too great.

Fifth—The conflict between users of water for irrigation and the navigation interests would still exist, and it is altogether impracticable to condemn the right of navigating a public stream.

### Riparians vs. Appropriators.

It has been proposed to limit the rights of riparian proprietors to water privileges for the use of stock and domestic purposes. While I heartily concur in this as a correct—in fact, the only admissible—definition of a riparian right in an irrigation country, I see very clearly how the State, by making this simple declaration and doing no more, will strike a blow at one (the riparian) class of interests, without clearing up the horizon for the other (the appropriator) class, and without doing anything for by far the larger class—those who have dry lands but no water claim at all.

The appropriators of water have done just what the law permitted them to do. Some few appropriators of water for irrigation have built good works, prepared their lands properly for irrigation, and are really public benefactors—for they have brought health and plenty where formerly ague and poverty, or widespread desolation reigned. They have, as a class, however, set up extravagant claims to water, have done little to make these claims good, and now hold them to the detriment of the people at large, not being able to organize, and economize the waters themselves, and permitting no one else to do it, because they fear to have adverse claims grow up. I repeat, it is quite natural that this should have been done. In fact, it is the only way by which rights to water could be held at all, and we would all do it if we could. But I doubt the propriety of the State attempting to limit one class of interests—the riparian—which, to say the least, is represented by the majority of people in the State who have any direct interest at all in the matter—for the benefit exclusively of another class—a small minority of her citizens—whom she has already permitted to acquire valuable, or what would then be exceedingly valuable, privileges by appropriating the waters of her streams, without at the same time taking steps to insure to the class restricted the rights which she does accord them.

The riparian principle carried out upon the

English common law rule should not be maintained in California. She never can be a truly great agricultural State without irrigation, and she should set that dog-in-the-manger principle aside, for a system which will insure a respect of all rights as far as can be, and accomplish the greatest good to the greatest number, by the use of the water in irrigation, as far as it can be, after satisfying the just demands of riparian proprietors by some means economical of the water supply, and at such seasons as will not materially interfere with navigation interests.

### The Proposed Remedy.

You will see from this about what I would propose as the solution of the irrigation question, namely: That the State shall direct and control the diversion of waters from the streams; insist upon its economical use; see that riparian proprietors are supplied with water for stock and domestic purposes, at least, if they cannot all come in for a share of the water for irrigation; see that all lands naturally dependent upon a public source of supply get their share, as far as the supply will go, upon some reasonable terms; and see that sufficient water is left in navigable streams to satisfy the interests of commerce, at stated seasons, when most needed.

This the State can do by virtue of her police authority, and in my humble judgment she will be obliged to do it some day, and the sooner it is done the better for all concerned.

Before, however, she can exercise this authority, she must know definitely what interests she has to deal with—what water rights have accrued and what is the nature of them—and there must be some general State plan of organization under which irrigation is to be carried on. There can be no satisfactory regulation of rights altogether undefined, and no settled condition of affairs until the irrigation interest is placed on a good business footing by a definition of present rights and an organization for future operations.

Hence, I propose that the State shall:

First—By the passage of a law entitled "An act to define and regulate water rights;"

Institute proceedings to define for record the extent and nature of all existing water privileges.

Provide for a proper record of existing rights to water, and for the annual correction of the same to date.

Provide for the issue of water privileges in proportion to the supply of water in each stream, and designate by schedule the extent and order of each claim.

Supervise, in a general way, the distribution of water from the streams of natural sources of supply, to those holding water privileges.

Establish a definite standard of measure for water used for agricultural and mining purposes, and prescribe the form and dimensions of measuring apparatus to be employed in dealing out water under different circumstances.

Second—By the passage of a law entitled "An act to promote irrigation;"

Provide for the organization of irrigation districts, from time to time, according to natural division of the land, as near as may be, in each instance.

Provide for the internal self-government of each such district by the resident thereof.

Provide for the allotment of permanent water privileges to such districts.

Provide for the condemnation of private water rights for the public use, in case of rights acquired to waters from public streams for lands within such districts.

Provide for the adjustment of riparian rights in each instance where a water privilege is granted to a regularly-organized district, so that riparian proprietors will be insured sufficient water for domestic and stock purposes, the district be held liable for its share of the expense of meeting this obligation, and the State undertake the adjustment.

Provide for the protection of river navigation by regulating the diversion of water from navigable rivers and their tributaries, so that in some certain periods the waters may be used for irrigation, and some other periods they shall be allowed to flow in the streams for the benefit of commerce.

Provide for the total extinguishment of rights by condemnation, where unadjustable conflicts occur.

Carry on such observations as will detect the locality and cause of waste or loss of water in each instance; conduct experiments with a view of discovering the most economical means of distributing and using water in irrigation without material loss or waste.

Establish general regulations, from time to time, for the distribution of water in irrigation, which will prevent waste, insure good drainage, and guard against the unhealthy tendency of careless and vicious use of water in irrigation.

### Important Points.

In framing these laws it must be kept in view that the sources of water supply vary in character, and that the nature of rights vary not only with the sources, but in themselves also.

Thus we may have sources of water supply of the following kinds:

Public streams—The living waters of navigable, tributaries of navigable, and non-navigable; the waters stored at private expense and that stored at public expense.

Private streams—The living waters of such to the extent of private claims, and the waters stored at private expense, and those stored at public expense.

Natural springs—Having sources above all appropriation; having sources to be affected by higher appropriation.

Artificial wells—Artesian wells and pump wells.

Waste water from irrigation canals.

Waste water from irrigated fields.

Waste water from drainage of moist land.

Claims to water have grown up from: Simple appropriation and use; filing notice, and appropriation under the Mining laws; filing notices, and appropriations under the Codes; appropriations under the Desert Land law; obtaining privileges from County Water Commissioners; through Spanish pueblo privileges, by ownership of the course, and the natural source of supply; by ownership of the bed of the stream; by ownership of the bank of the stream; by the construction of private wells; by the storage of waste waters.

### What may be Expected.

It is not to be expected that any law or laws can be framed at once which will settle the many conflicts of interest that arise out of these diverse interests and conditions. Without doubt many questions must for all time go to the Courts. But it is certainly possible to put irrigation upon a far better basis than it is now, and at the same time give the Courts some better guide in the execution of their duty than they have now. Certainly, the whole question can be simplified in the manner I propose, and I must confess that after much thought I see no other way how it can be accomplished.

If the matter goes on as it is, it will result in settling the disputes between rival claimants in the monopoly of all good water privileges by a few individuals, who will have water to sell under claims acquired without regulation, in the waste of water by reason of works constructed without system and used without proper supervision, and in many instances in the production of unhealthy neighborhoods by unskilled and unrestricted use of water.

And in the settling of disputes between appropriators and riparian proprietors on all streams of short supply, the appropriator will probably go to the wall, and water which might be made, under a proper organization, to irrigate thousands of acres of land, will be allowed to waste in the dry sand beds of streams and the pools of swamps, to effect some little natural irrigation below, or water a few head of live stock.

The conflict between water appropriation for irrigation and the navigation interests of streams below, cannot be settled but by the intervention of State regulation as indicated.

### Effect of the Proposed Plan.

The plan which I have outlined contemplates:

State regulation of the public sources of supply, the streams, and of waters allotted to claimants from those sources.

District or private regulation, under general State laws, of the details of distribution from the canals to the irrigators.

State regulation of the use of water in irrigation—to the end that none be wasted.

State adjustment of conflicting rights by arbitration, as it were, when possible, or by condemnation where necessary and possible.

When this much has been accomplished there will then be a good basis of credit in irrigation property. Capital can be obtained for the construction of irrigation works, on the credit of a district, whenever it is known that there attaches to the lands thereof, from the State, a good and sufficient water right for their irrigation.

For instance, a district embracing 30,000 acres of land has a water right. The lands were worth, dry, five dollars per acre. It will cost \$10 per acre to completely irrigate them. The district says to capital, construct our works according to pre-arranged State plans and specifications. We, the district, taken as a whole, will pay for this in 50 annual installments, principal and interest, the money to be raised by taxation on the whole property of the district under the State law, and, at the end of 50 years, take the works off your hands. In the meantime, revenue for the maintenance and administration of the works, to be raised from the sale of water to actual irrigators, at prices within limits to be pre-arranged.

By this plan good works would be constructed cheaply. The capital becomes a contractor to build works. The State supervises their construction. The interests of the district are protected. Capital has a security because there is a good water right attached to the land, and the State is the arbiter between parties to the transaction, by her general law properly administered.

The working of the plan would not be an attack on any class of interests. The appropriators would have their rights definitely determined by a procedure in which they would be called upon to prove their claims according to the measurements and statistics of the State, made and collected by her Engineer Department. They would not be put to any considerable expense; they would be relieved in many instances from future litigation and expense by having the facts affecting their claims and all rival claims, made of record, definitely, at once, and there would be no impediment put in the way of continued acquirement of right to the use of water under moderate and wholesome regulations.

Riparian proprietors would be assured their privileges as far as possible, and would be protected from the effects of the unregulated appropriation which they now fear.

The people of the State would be benefited by an assurance on the part of the State, that the waters would be used to the best advantage for the greatest number of those requiring them.

I shall call the attention of the Legislature at the approaching session to this matter, and submit a more definite plan than here outlined, for the consideration of its members.

In conclusion, permit me to observe that, in my opinion, by effecting the object aimed at herein—the settling of water right disputes, the conservation and exusion of the water supply for irrigation—the State will have only done simple justice to its residents of the largest portion of her territory, and will have practically increased her wealth many fold.

## The Suro Tunnel.

### Renewed Interest in Connection with It.

The Suro tunnel is once more a matter of absorbing interest to a large number of the mines along this portion of the Comstock, and the subject of connections with it is agitating the mining people anew. The connection about to be made to the Jacket is the central point around which much of the above-mentioned interest centers.

The south head of the tunnel is now in Con. Imperial ground, at the distance to the Jacket shaft does not vary much from 1,200 ft. The Con. Imperial has 463 ft., the Challenge 90, the Confidence 130 and the Jacket to the shaft, as per survey, 600 ft. This will make a total of 1,283 ft. The header does not move squarely across timbers, but the Jacket will make its connection at least 80 ft. further north than where the survey point lies; hence the difference in the distance to run. This, with the distance Imperial, will bring the total to about 1,200 ft. on the line run.

From the point where the Jacket will connect with the south lateral branch of the tunnel, or at least the point where it was to connect by the survey, the lateral will bear still more strongly to the east in the direction of the Forman shaft. To carry it so far away from the line of the present pumping works of the Belcher that the nearest point of connection for that mine will be where the Jacket makes its connection. The Belcher is looking up this matter of connecting with the tunnel, and the chances are that for the purposes of enabling that mine to carry on the work of drainage economically until such time as it will be able to use the Forman shaft, in which it owns a large interest, it will make its connection through the Jacket, even though it has to raise the water to the required level itself. The flow of water from the Imperial and the mines of its group heavy, and it is not certain that even the double line of Jacket pumps below the tunnel belt could handle it all, and take, in addition, what flows to the Belcher Crown Point pumps. To make assurance doubly sure, very likely the Belcher will connect its main line, in which its pumps operate with the Jacket shaft, at or about the level of the south lateral of the tunnel, and send its water through the way. It could then double its line up to thal level and bid defiance to the heaviest flows of water from the lower levels.

It is on account of all these things that more than usual interest just now centers around the connection with the tunnel about to be made from the Jacket shaft. This work must be done before any further explorations can be made in any of the mines between the Belcher and Overman. The latter has connection with the Belcher, so that when that mine connects with the tunnel the Overman and Caledonia can be trained also into the tunnel through the Belcher and its connections, and this fact intensifies interest in the Jacket connection. The problem of ventilation has been well solved on to Comstock, and the water problem will be well worked out when connections have been made with the Suro tunnel as above outlined.—*Gold Hill News.*

THE COAL FIELDS OF FRESNO COUNTY.—It is plain that, at an early day, the dwellers on the plains, through the San Joaquin valley, will find it cheaper to use coal than wood for fuel. This state of affairs would exist now if the Southern Pacific road was finished through by Pacheco pass, as would tap the coal fields of Fresno county. Numerous veins of coal, of a quality equal to or not superior to that from Mount Diablo, permeate the hills south of the Panoche and east of the Vallecitos canyon. The completion of the road would place a large portion of this valley within a comparatively short distance of the coal fields, and would enable people to obtain it at all times, and at prices that would enable them to burn it in preference to wood.—*Fresno Expositor.*

THE GUAYMAS AND SONORA RAILROAD.—Rapid progress is being made on the road from Guaymas north to intercept the southern overland road. The citizens of Guaymas are very much in favor of the railroad and earnestly desire its completion, which is said will be on or about the 1st of May, 1881. Times in Guaymas have greatly improved and there is a great rush of American immigration, some remaining in these cities to establish business and many going into mining districts in the interior of the State. Mexico now extends a warm and hearty welcome to American immigration. The jealous feeling which has for years existed between the two republics has entirely died away.

## THE ENGINEER.

## First Principles.

There is such a harmony in science, its various departments are so closely connected and correlated, that the knowledge of first principles is not only a necessity, but, in fact, if properly understood, forms the means of an extensive and correct practical application. Without the understanding of the principles which underlie a science or practice, the most practical of men will enact or repeat the grossest blunders. Practice forms a not-to-be underrated means of teaching principle, but often requires a long experience, great practice and at all times good judgment to deduce principles, which an intelligent study of the theory of the science will convey to us in a short time and more satisfactory way. Practice should constitute the embodiment of known principles and the means of deducing new ones, at not, as is now often the case, a method of teaching or verifying old, well known principles which have long been accepted, and knowledge of which would have prevented a useless expenditure of time and money.

The greater portion, not the whole, of the work of finding the necessary strength of bridges can be reduced to an application of the principle of moments, and similarly the strength of the working parts of the steam engine is, to a great extent, an application of this same principle. The numerous failures of roofs of buildings are solely due to lack of knowledge of first principles. As a general thing the architect scorns the use of the formulae of mechanics, of which he is too often grossly ignorant. The "rule of thumb" is the favorite method adopted, and consequently when a roof is designed for a building of a form and so which has not come within his previous experience, or that of his immediate advisers, the proper additional and required strength or "the extra inch of timber" is guessed at in a slipshod manner, instead of being calculated, and the structure constructed fully able to successfully withstand the strain to which it is subjected.

"Accidents" like that of the Hippodrome and of the post-office, New York, where one might have justly expected that the best talent would have been secured, we owe to the fact that instead of applying the fundamental laws of mechanics to compute the required strength, the architect thought the roof was strong enough—a matter of guess-work and not of positive knowledge, as was within his power to have. The Tay bridge disaster was in the main due to the neglect of not considering the effect of the pressure of the wind. In the construction of the Hudson River tunnel, attention was not paid to the universal law that that portion of a structure which is not constantly used, and upon the strength of which the safety of the remainder of the structure and its occupants depends, should possess sufficient strength under the most adverse conditions possible. The principles of the conservation of energy are the basis of all our reasoning relative to the transformation of energy in various modes of motion, and without a knowledge of these principles we must inevitably fall into error, and endorse valueless schemes for realizing fabulous power. In ordinary discussion in technical journals, especially in communications, the general lack of the fundamental principles is being constantly exposed. We propose to enter this subject of first principles more thoroughly, and especially to present the views of some of our more prominent engineers upon the value of the knowledge of the first principles in particular, and more important branches of the engineering profession.

## Continental Railroads.

At the rate railway building is progressing and new projects are undertaken, says the *Iron Age*, this continent will not lack for means of transportation between the Atlantic and Pacific. To mention De Lesseps' canal and the rival one that is proposed to build through Nicaragua, and ignore Capt. Eads' ship railway, four lines of railway are built or building to connect the Atlantic slope with the Pacific. The Union and Central are the completed lines. The Southern has to have been ready Jan. 1st, but will hardly be finished before March 1st. The Northern Pacific has been put into the hands of a construction company to build, and is to be pushed to completion, while the details of the argument for the construction of the Canadian Pacific, which provides that it shall be completed before Jan. 1, 1891, are at hand. When these are all done, he who wishes to see the hi-trees can have a choice of routes. What the effect of the completion of these lines will be on the course of trade it will be impossible to tell, but he would be regarded as a wild enthusiast who should predict what will be, probably, a reality before many years. Albert Richardson in an article apostrophized New York and San Francisco as the cities that should yet contest for the commercial empire of the world. This may not be a prophecy with no realization.

**AUSTRALIAN GOLD.** Official statistics show that Australia has supplied England during the last five years with \$11,738,000 in gold coin and bullion.

## USEFUL INFORMATION.

## Remarkable Echoes.

In the sepulchre of Metella, the wife of Sulla, in the Roman campagna, there is an echo which repeats five times, in different keys, and will also give back with distinctness a hexameter line which requires two and a half seconds to utter it.

On the banks of the Naha, between Bingen and Coblenz, an echo repeats 17 times. The speaker may scarcely be heard and yet the responses are loud and distinct, sometimes appearing to approach, at other times to come from a great distance.

Echoes equally beautiful and romantic are to be heard in our own islands. In the Abercorn family at Paisley, when the door of the chapel is shut, the reverberations are equal to the sound of thunder. If a single note is breathed, the tone ascends gradually with a multitude of echoes, until it dies in soft and bewitching murmurs. In this chapel is interred Margery, the daughter of Bruce and the wife of William Wallace.

The echo at the Eagle's Nest, on the banks of Killarney, is renowned for its effective repetition of a huge call which seems to be repeated by a hundred instruments, until it gradually dies away in the air. At the report of a cannon the loudest thunders reverberate from the rock and die in seemingly endless peals along the distant mountains.

At the Castle of Simenetta, a nobleman's seat, about 20 miles from Milan, a surprising echo is produced between the two wings of the building. The report of a pistol is repeated by this echo 60 times; and Addison, who visited the place on a somewhat foggy day, when the air was unfavorable to the experiment, counted 56 repetitions. At first they were very quick, but the intervals were greater in proportion as the sound decayed. It is asserted that the sound of one musical instrument in this place resembles a great number playing in concert. This echo is occasioned by the existence of two parallel walls of considerable length, between which the wave of sound is reverberated from one to the other until it is entirely spent.

**A NEW LIQUID GLUE.**—To produce good glue size, dissolve in a copper pan heated by indirect steam, four and one-half to five lbs. of soda in 20 lbs. to 24 lbs. of boiling water; then add to it, stirring well at the time, 30 lbs. of powdered resin, keeping the whole continually boiling until the resin is perfectly dissolved. This soda-resin composition, dissolved in the proportion of one lb. of resin to 30 lbs. or 40 lbs. of water, is to be mixed well together with a glue solution, made by dissolving 10 lbs. of glue in about 30 lbs. to 40 lbs. of water; then boil up both solutions together for about 10 minutes, after which run it through a fine sieve or filter, and it is then ready for use. The best proportions for mixing the vegetable and animal size are for one and a half parts resin add one part glue.

**PRESERVATIONS OF WOOD.**—The method of preserving wood by the application of lime, as pursued by M. Stostal, is published in the French journals. He piles the planks in a tank, and puts over all a layer of quicklime, which is gradually slaked with water. Timber for mines requires about a week to be thoroughly impregnated, and other wood more or less time according to its thickness. The material acquires a remarkable degree of hardness on being subjected to this process, and it is alleged, will never rot. Beech wood had been prepared in this way for hammers and other tools for iron work, and it is said to become as hard as oak without parting with any of its elasticity or toughness, and to last much longer than when not thus prepared.

**NEW MATERIAL FOR BRICK.**—Blast-furnace slag, that most hopeless of all waste substances, is now utilized to a great extent. It is converted into sand, mixed with a certain proportion of siliceous lime, and manufactured into bricks which possess many advantages over the ordinary bricks of commerce. By reducing the slag to a fibrous condition a material is produced which is usefully employed as a non-conductor of heat in clothing steam pipes and boilers. It is used in the manufacture of glass bottles and glass railway sleepers. But the most recent invention in slag utilization is in the production of a pure, white cement of greater strength than the best Portland cement.

**PHOSPHORESCENT LAMP FOR MINERS.**—The latest and not the least promising application of luminous paint is in the production of a safety lamp for coal miners. It is said to give light enough for practical use, and it is obvious that, in containing no fire, it is absolutely free from risk. By this invention, in connection with compressed-air blasting, fire and the attendant danger of exploding fire damp might be ruled out and the most dangerous mines made comparatively safe.

**FROZEN POTATOES.**—When potatoes are frozen the amount of sugar they contain is doubled, the starch undergoing a corresponding diminution, while part of the protein passes from the coagulable into the soluble form. During the process of rotting the potato loses half its nitrogenous constituents and the whole of the sugar.

## Glass Cloth Made in Pittsburgh.

One of the chief characteristics of glass is brittleness. "As brittle as glass" is a comparison frequently made, but, notwithstanding this marked characteristic, glass is susceptible of being spun and woven into fabrics as perfect, delicate, durable and handsome as the finest silk. Glass has been spun and woven in Austria for a number of years, but not until recently has this feat been attempted in the United States. A prominent Pittsburgh glass manufacturing firm, Messrs. Atterbury & Co., says the *American Manufacturer*, have provided themselves with facilities for producing various kinds of fabrics from this ordinarily brittle substance, some of which they have already made. Among the articles they are prepared to exhibit are a napkin, a towel and tablecloth. The latter is about six ft. square, and white in color, except the ends and sides, which are a delicate green, and the four edges are fringed. The towel and napkin are the same as the tablecloth, except the ornamental border, which in one is red and in the other pink. These fabrics are as flexible and but slightly heavier than those woven of flax, and the manufacturers state that they can be washed and ironed, like the ordinary tablecloths and napkins. Besides these articles the firm have a number of large feathers made by them, which are fashioned of variously colored threads of glass, the base being a piece of brass wire. These feathers resemble ostrich feathers, and are wondrously beautiful in shape and color. These good Messrs. Atterbury & Co. will place on the market just as soon as there is a demand for them.

The firm can spin 250 of these fine threads, each ten miles in length, in one minute, the process being much more interesting than the spinning of cotton or other threads by the usual methods. The weaving is done with an ordinary loom, some of the machinery of which the firm have adapted to the requirements of the manufacture. The fabric cannot be ripped or torn, and can be sold at a less price than cotton, silk, or whatever other fabric imitated. The firm state that the cloth, whether coarse or fine, when worn as a dress or shawl, or other garment, will be just as warm, easy-fitting and comfortable every way as clothing of any other kind.

The firm are now fully prepared to receive orders for glass garments of any description.

**CEMENT FOR UNITING LEATHER AND METAL.** Wash the metal with hot gelatine; steep the leather in an infusion of nutgalls (hot) and bring the two together.

## GOOD HEALTH.

## Pertinent Facts About Eating.

In a recent number of the *London Standard* under the query, "Do we eat too much?" the writer gives many interesting facts. He says, for instance, that the amount of nourishment which a person needs greatly depends on his constitution, state of health, habits and work. A sedentary man requires less than one whose duties demand the exercise of his muscles, and a brain-worker needs more than an idler. But unquestionably the majority of us take more than we need. Indeed, food and work are distributed most unequally. The man of leisure is also the man of means, and accordingly fares sumptuously every day; while the laborer toils for eight hours and finds it difficult to get enough to repair the waste of his tissues. Yet a Chinaman or a Bengalee will toil under a tropical sun, and find a few pieces of rice or jowhar sufficient to sustain his strength. A Frenchman will not eat half what an Englishman engaged in the same work will demand, and a Spanish laborer, content in ordinary times with a watermelon and a bit of black bread, will toil in the vineyard and grow fat on a dietary of onion porridge and grapes.

It is true that Mr. Brassey, when building the Continental railway, found that one English navy was worth a couple of spare-fed foreigners. But, on the other hand, the British-Columbian and Californian gold-diggers, than whom a more magnificent set of athletes does not exist, live in the remote mountains of the far West mainly on beans flavored with a few cubes of pork. But they also obtain the best of water and the purest of air, and their outdoor life and active exercise enable them to digest every ounce of their frugal fare. The English soldiers, though better fed than those of any army except the American, do not get one-half the solid nutriment which the idliest of club-loungers considers indispensable for his sustenance. An athlete in training is allowed even less food; yet he prospers on the limited fare, and prolongs his life by the regimen by which he has been subjected.

King Victor Emmanuel was a monarch of the most robust physique; yet he only ate one meal per day, and it is manifestly absurd for any man to require three more or less weighty meals, and an afternoon cup of tea, to support the exertion of walking to the club, riding an hour in the park, writing a note or two and dancing a couple of miles around a ball room. The audience had their "amethysts," or "sober stones" by which they regulated their indulgence at table. The moderns have not even this. But they have their gont and their livers to warn them, when it is too late, that nature has been overtaken.

## The Air We Breathe.

It is composed of one part of oxygen and four parts nitrogen. The former supports life, the latter extinguishes it. The more oxygen there is, the livelier, the healthier and the more joyful are we; the more nitrogen, the more sleepy and stupid and dull we become. But if all the air were oxygen, the first lighted match would wrap the world in instant flame; if all were nitrogen, the next instant there would not be upon the populated globe a single living creature. When oxygen was discovered by Priestley, nearly 80 years ago, there was great jubilation among doctors and chemists. The argument was plausible, and seemed perfectly convincing: "If oxygen is the life and health of the atmosphere, as we have found out how to make oxygen, we have only to increase the quantity in the air we breathe, in order to wake up new life, to give health to the diseased, and youth to the aged." But, on trial, it was found that it made a man a maniac or a fool, and if continued, a corpse. Various other experiments have been made to improve upon the handiwork of the Allwise Maker of the Universe, but they have been successive failures, and thinking men have long since come to the conclusion that, as there can be no improvement upon the cold water of the first creation in slaking thirst, so there can be no addition made to pure air which will better answer its life-sustaining purposes. And as there is not, in all nature, a still, warm atmosphere that does not instantly begin to degenerate decay, corruption and death, so there is no chamber of the sick, graduated to a degree, that will not hasten the end desired to be averted.

**HIPPOTRAPHY IN FRANCE.**—Some very interesting statistics have been published by the society for promoting the use of horse flesh and the flesh of asses and mules as food, showing how steadily the consumption of these articles of diet has been increasing in Paris and the provinces since the foundation of the society in 1866. The weight has increased from 171,300 lbs. in 1866 to 1,982,620 lbs. in 1879. In the principal cities of the provinces the consumption of horse-flesh may be considered to have fairly taken root. At Marseilles, in 1870, there were 599 horses eaten, 1,031 in 1875, and 1,533 in 1878. At Nancy, 165 in 1873, over 350 in 1876, and 705 in 1878; at Rheims, 291 in 1874, 423 in 1876 and 384 in 1878; at Lyons, 1,839 in 1873 and 1,313 in 1875. In both the latter cases some difficulties had been thrown in the way by the town authorities, as was the case recently at Chalons-sur-Marne, where the Mayor fixed the price of the horse-flesh at a higher rate than that of beef. The average price of horse meat is from 25 to 30 cents per lb. Each horse furnishes about 200 kilogrammes (four cwt.) of meat, which is capable of being prepared in many by no means unappetizing ways, such as *pot-au-feu*, boiled, roasted, hashed, haricot, juggled fillet, etc.

**TOO MUCH CIGARETTE.**—There is too much cigarette. The small boy has got it into his mouth, and it is using him up. The Philadelphia *Times* says physicians and other people in that city are pained by the spectacle, growing more common every day, of pale-faced lads, ranging in age from 6 to 20 years, who are puffing their little lives away in smoking. Day and night they throng the streets, where the peculiar offensive odor generated by cigarettes made of cheap paper and bad tobacco renders their smoking as obnoxious to others as it is hurtful to themselves. Every evening before the doors of the theaters they raise a cloud of foul smoke that is equally injurious to their own rickety constitutions and to the noses of their victims. Doubtless, also, they carry their pernicious habit into their homes—when they are old enough to do so without risk of the spanking that they deserve—thus still further doing harm to themselves and making other people uncomfortable.

**PHENOMENAL EXUDATION OF BLOOD.**—The Chicago *Daily News* of Dec. 20th, says: The doctors are puzzled and interested by a peculiar case on the west side. A 14-year-old son of Wm. Crawford, captain of a tug boat, has for some years been sweating blood at times, and lately has had severe attacks which alarmed his parents. His infirmity comes on him usually after taking cold. Great black patches appear on his body, from which blood drops, the size of a pinhead, exude. Blood flows from his mouth, nose, ears, stomach, and even from his bladder and kidneys. No pain accompanies these discharges, but they make his blood thin, and weaken him. Sudden fright or excitement will easily check the flow. He is mentally bright, and his father, mother, brothers and sisters are strong and healthy. The physicians who have taken an interest in his case, propose sending him to Edinburgh and London, for examination by the Academy of Surgeons.

**CURE FOR DANDRUFF.**—Mr. John L. Davis, in the *Journal of Pharmacy*, asserts (having fully tested it in his own case), that a preparation of one ounce of sulphur and one quart of water, repeatedly agitated during intervals of a few hours, and the head saturated every morning with the clear liquid, will, in a few weeks, remove every trace of dandruff from the scalp, and the hair will become soft and glossy. He says: "I do not pretend to explain the *modus operandi* of the treatment, for it is well known that sublimed sulphur is almost or wholly insoluble, and the liquid used was destitute of taste, color or smell. The effect speaks for itself."

## Irrigation and Water Rights.

State Engineer W. H. Hall, has made to the Governor the following supplemental report on the water question in California:

Conflicts of interest, for whose adjustment the present laws afford no adequate method, keep matters connected with water rights for irrigation in such an unsettled condition that there is no basis of credit upon which to raise money for the construction of irrigation works, and no certainty in farming with irrigation, except in cases where all rights can be monopolized or brought under one control, and these instances are few.

Two general classes of conflicts have made themselves known throughout the counties where irrigation is now practiced, namely:

Conflicts between rival appropriators of water, or claimants by prescription; and,

Conflicts between appropriators, or claimants by prescription, and riparian owners.

Of course there are an infinite number of sub-varieties of cases which come up under each of the general classes.

In the San Joaquin valley, not only are these conflicting interests present, but another element will soon make its appearance (indeed it has already), and we will have inevitably, unless the State controls and directs the diversion of waters from the San Joaquin river and its tributaries.

The worst conflict of all, namely: that between the appropriators of waters for irrigation, and the navigation interests on the main river.

### Proposed Settlement of Conflicts.

The question is, how to do away with this clashing of interests.

To settle conflicts between appropriators or claimants by prescription, it has been proposed—and I find the plan advocated by many worthy people in the irrigation regions—that the State take charge of this whole matter of irrigation—condemn and pay for all existing rights to water, for the public benefit, construct the works of irrigation, and sell the water.

As a variation to this, others advocate an appropriation of the waters, after being condemned for the public good, and paid for by the State, to the lands requiring them.

And again, other people would have all water rights condemned, but paid for by the lands to be benefited in each instance.

I do not think any such plan is feasible, and for the following reasons:

First—The outlay for the satisfaction of existing water claims would necessarily be so great that the State could not be brought to undertake the settlement.

Second—If the State should undertake the construction of irrigation canals, or works of irrigation proper, her enterprise would fail of success, and involve her in enormous expenditures of money.

(See Chapter V, of Part IV, Report of State Engineer, January, 1880.)

Third—If the State should reapportion the waters, the supply would not be sufficient for all, and the conflict would be as great as ever.

Fourth—The conflict between users of water for irrigation and claimants under the riparian principle would still exist, and could not be done away with by condemnation—for the field is immeasurably too great.

Fifth—The conflict between users of water for irrigation and the navigation interests would still exist, and it is altogether impracticable to condemn the right of navigating a public stream.

### Riparians vs. Appropriators.

It has been proposed to limit the rights of riparian proprietors to water privileges for the use of stock and domestic purposes. While I heartily concur in this as a correct—in fact, the only admissible—definition of a riparian right in an irrigation country, I see very clearly how the State, by making this simple declaration and doing no more, will strike a blow at one (the riparian) class of interests, without clearing up the horizon for the other (the appropriation) class, and without doing anything for by far the larger class—those who have dry lands but no water claim at all.

The appropriators of water have done just what the law permitted them to do. Some few appropriators of water for irrigation have built good works, prepared their lands properly for irrigation, and are really public benefactors—for they have brought health and plenty where formerly egue and poverty, or widespread desolation reigned. They have, as a class, however, set up extravagant claims to water, have done little to make these claims good, and now hold them to the detriment of the people at large, not being able to organize, and economize the waters themselves, and permitting no one else to do it, because they fear to have adverse claims grow up. I repeat, it is quite natural that this should have been done. In fact, it is the only way by which rights to water could be held at all, and we would all do it if we could. But I doubt the propriety of the State attempting to limit one class of interests—the riparian—which, to say the least, is represented by the majority of people in the State who have any direct interest at all in the matter—for the benefit exclusively of another class—a small minority of her citizens—whom she has already permitted to acquire valuable, or what would then be exceedingly valuable, privilege by appropriating the waters of her streams, without at the same time taking steps to insure to the class restricted the rights which she does accord them.

The riparian principle carried out upon the

English common law rule should not be maintained in California. She never can be a truly great agricultural State without irrigation, and she should set that dog-in-the-manger principle aside, for a system which will insure a respect of all rights as far as can be, and accomplish the greatest good to the greatest number, by the use of the water in irrigation, as far as it can be, after satisfying the just demands of riparian proprietors by some means economical of the water supply, and at such seasons as will not materially interfere with navigation interests.

### The Proposed Remedy.

You will see from this about what I would propose as the solution of the irrigation question, namely: That the State shall direct and control the diversion of waters from the streams; insist upon its economical use; see that riparian proprietors are supplied with water for stock and domestic purposes, at least, if they cannot all come in for a share of the water for irrigation; see that all lands naturally dependent upon a public source of supply get their share, as far as this supply will go, upon some reasonable terms; and see that sufficient water is left in navigable streams to satisfy the interests of commerce, at stated seasons, when most needed.

This the State can do by virtue of her police authority, and in my humble judgment she will be obliged to do it some day, and the sooner it is done the better for all concerned.

Before, however, she can exercise this authority, she must know definitely what interests she has to deal with—what water rights have accrued and what is the nature of them—and there must be some general State plan of organization under which irrigation is to be carried on. There can be no satisfactory regulation of rights altogether undefined, and no settled condition of affairs until the irrigation interest is placed on a good business footing by a definition of present rights and an organization for future operations.

Hence, I propose that the State shall:

First—By the passage of a law entitled "An act to define and regulate water rights."

Institute proceedings to define for record the extent and nature of all existing water privileges.

Provide for a proper record of existing rights to water, and for the annual correction of the same to date.

Provide for the issue of water privileges in proportion to the supply of water in each stream, and designate by schedule the extent and order of each claim.

Supervise, in a general way, the distribution of water from the streams of natural sources of supply, to those holding water privileges.

Establish a definite standard of measure for water used for agricultural and mining purposes, and prescribe the form and dimensions of measuring apparatus to be employed in dealing out water under different circumstances.

Second—By the passage of a law entitled "An act to promote irrigation."

Provide for the organization of irrigation districts, from time to time, according to natural division of the land, as near as may be, in each instance.

Provide for the internal self-government of each such district by the resident thereof.

Provide for the allotment of permanent water privileges to such districts.

Provide for the condemnation of private water rights for the public use, in case of rights acquired to waters from public streams for lands within such districts.

Provide for the adjustment of riparian rights in each instance where a water privilege is granted to a regularly-organized district, so that riparian proprietors will be insured sufficient water for domestic and stock purposes, the district be held liable for its share of the expense of meeting this obligation, and the State undertake the adjustment.

Provide for the protection of river navigation by regulating the diversion of water from navigable rivers and their tributaries, so that in some certain periods the waters may be used for irrigation, and some other periods they shall be allowed to flow in the streams for the benefit of commerce.

Provide for the total extinguishment of rights by condemnation, where unadjustable conflicts occur.

Carry on such observations as will detect the locality and cause of waste or loss of water in each instance; conduct experiments with a view of discovering the most economical means of distributing and using water in irrigation without material loss or waste.

Establish general regulations, from time to time, for the distribution of water in irrigation, which will prevent waste, insure good drainage, and guard against the unhealthy tendency of careless and vicious use of water in irrigation.

### Important Points.

In framing these laws it must be kept in view that the sources of water supply vary in character, and that the nature of rights vary not only with the sources, but in themselves also.

Thus we may have sources of water supply of the following kinds:

Public streams—The living waters of navigable, tributaries of navigable, and non-navigable; the waters stored at private expense and that stored at public expense.

Private streams—The living waters of each to the extent of private claims, and the waters stored at private expense, and those stored at public expense.

Natural springs—Having sources above all appropriation; having sources to be affected by higher appropriation.

Artificial wells—Artesian wells and pump wells.

Waste water from irrigation canals.

Waste water from irrigated fields.

Waste water from drainage of moist land.

Claims to water have grown up from: Simple appropriation and use; filing notice, and appropriation under the Mining laws; filing notices, and appropriations under the Codes; appropriations under the Deert Land law; obtaining privileges from County Water Commissioners; through Spanish pueblo privileges, by ownership of the course, and the natural source of supply; by ownership of the bed of the stream; by ownership of the bank of the stream; by the construction of private wells; by the storage of waste waters.

### What may be Expected.

It is not to be expected that any law or laws can be framed at once which will settle the many conflicts of interest that arise out of these diverse interests and conditions. Without doubt many questions must for all time go to the Courts. But it is certainly possible to put irrigation upon a far better basis than it is now, and at the same time give the Courts some better guide in the execution of their duty than they have now. Certainly, the whole question can be simplified in the manner I propose, and I must confess that after much thought I see no other way how it can be accomplished.

If the matter goes on as it is, it will result in settling the disputes between rival claimants in the monopoly of all good water privileges by a few individuals, who will have water to sell under claims acquired without regulation, in the waste of water by reason of works constructed without system and used without proper supervision, and in many instances in the production of unhealthy neighborhoods by unskilled and unrestricted use of water.

And in the settling of disputes between appropriators and riparian proprietors on all streams of short supply, the appropriator will probably go to the wall, and water which might be made, under a proper organization, to irrigate thousands of acres of land, will be allowed to waste in the dry sand beds of streams and the pools of swamps, to effect some little natural irrigation below, or water a few head of live stock.

The conflict between water appropriation for irrigation and the navigation interests of streams below, cannot be settled but by the intervention of State regulation as indicated.

### Effect of the Proposed Plan.

The plan which I have outlined contemplates:

State regulation of the public sources of supply, the streams, and of waters allotted to claimants from those sources.

District or private regulation, under general State laws, of the details of distribution from the canals to the irrigators.

State regulation of the use of water in irrigation—to the end that none be wasted.

State adjustment of conflicting rights by arbitration, as it were, when possible, or by condemnation where necessary and possible.

When this much has been accomplished there will then be a good basis of credit in irrigation property. Capital can be obtained for the construction of irrigation works, on the credit of a district, whenever it is known that there attaches to the lands thereof, from the State, a good and sufficient water right for their irrigation.

For instance, a district embracing 30,000 acres of land has a water right. The lands were worth, dry, five dollars per acre. It will cost \$10 per acre to completely irrigate them. The district says to capital, construct our works according to pre-arranged State plans and specifications. We, the district, taken as a whole, will pay for this in 50 annual installments, principal and interest, the money to be raised by taxation on the whole property of the district under the State law, and, at the end of 50 years, take the works off your hands. In the meantime, revenue for the maintenance and administration of the works, to be raised from the sale of water to actual irrigators, at prices within limits to be pre-arranged.

By this plan good works would be constructed cheaply. The capital becomes a contractor to build works. The State supervises their construction. The interests of the district are protected. Capital has a security because there is a good water right attached to the land, and the State is the arbiter between parties to the transaction, by her general law properly administered.

The working of the plan would not be an attack on any class of interests. The appropriators would have their rights definitely determined by a procedure in which they would be called upon to prove their claims according to the measurements and statistics of the State, made and collected by her Engineer Department. They would not be put to any considerable expense; they would be relieved in many instances from future litigation and expense by having the facts affecting their claims and all rival claims, made of record, definitely, at once, and there would be no impediment put in the way of continued acquirement of right to the use of water under moderate and wholesome regulations.

Riparian proprietors would be assured their privileges as far as possible, and would be protected from the effects of the unregulated appropriation which they now fear.

The people of the State would be benefited by an assurance on this part of the State, that the water would be used to the best advantage for the greatest number of those requiring them.

I shall call the attention of the Legislature at the approaching session to this matter, and submit a more definite plan than here outlined, for the consideration of its members.

In conclusion, permit me to observe that, in my opinion, by effecting the object aimed at herein—the settling of water right disputes, the conservation and extension of the water supply for irrigation—the State will have only done simple justice to the residents of the largest portion of her territory, and will have practically increased her wealth many fold.

## The Sutro Tunnel.

### Renewed Interest in Connection with It.

The Sutro tunnel is once more a matter of absorbing interest to a large number of the mine along this portion of the Comstock, and the subject of connections with it is agitating the mining populace anew. The connection about to be made by the Jacket is the central point around which much of the above-mentioned interest centers.

The south header of the tunnel is now in Con. Imperial ground, and the distance to the Jacket shaft does not vary much from 1,200 ft. The Con. Imperial has 463 ft., the Challenge 90, the Confidence 130, and the Jacket to the shaft, as per survey, 600 ft. This will make a total of 1,283 ft. The header does not move squarely across the mines, but the Jacket will make its connection at least 80 ft. further north than where the survey point lies; hence the difference in the distance to run. This, with the distance in Imperial, will bring the total to about 1,200 ft. on the line run.

From the point where the Jacket will connect with the south lateral branch of the tunnel, or at least the point where it was to connect by this survey, that lateral will bear still more strongly to the east in the direction of the Forman shaft. This will carry it so far away from the line of the present pumping works of the Belcher that the nearest point of connection for that mine will be where the Jacket makes its connection. The Belcher is looking up this matter of connecting with the tunnel, and the chances are that for the purposes of enabling that mine to carry on the work of drainage economically until such time as it will be able to use the Forman shaft, in which it owns a large interest, it will make its connection through the Jacket, even though it has to raise the water to the required level itself. The flow of water from the Imperial and the mines of its group is heavy, and it is not certain that even the double line of Jacket pumps below the tunnel level could handle it all, and take, in addition, what flows to the Belcher-Crown Point pumps. To make assurance doubly sure, very likely the Belcher will connect its main incline, in which its pumps operate with the Jacket shaft, at or about the level of the south lateral of this tunnel, and send its water through that way. It could then double its line up to that level and bid defiance to the heaviest flows of water from the lower levels.

It is on account of all these things that more than usual interest just now centers around the connection with the tunnel about to be made from the Jacket shaft. This work must be done before any further explorations can be made in any of the mines between the Bulion and Overman. The latter has connection with the Belcher, too, so that when that mine connects with the tunnel the Overman and Caledonia can be drained also into the tunnel through the Belcher and its connections, and this fact intensifies interest in the Jacket connection. The problem of ventilation has been well solved on the Comstock, and the water problem will be well worked out when connections have been made with the Sutro tunnel as above outlined.—*Gold Hill News*.

**THE COAL FIELDS OF FRESNO COUNTY.**—It is plain that, at an early day, the dwellers on the plains, through the San Joaquin valley, will find it cheaper to use coal than wood for fuel. This state of affairs would exist now if the Southern Pacific road was finished through by Pacheco pass, as it would tap the coal fields of Fresno county. Numerous veins of coal, of a quality equal to if not superior to that from Mount Diablo, permeate the hills south of the Panoche and east of the Vallecitos canyon. The completion of this road would place a large portion of this valley within a comparatively short distance of the coal fields, and would enable people to obtain coal at all times, and at prices that would enable them to burn it in preference to wood.—*Fresno Examiner*.

**THE GUAYMAS AND SONORA RAILROAD.**—Rapid progress is being made on the road from Guaymas north to intercept the southern overland road. The citizens of Guaymas are very much in favor of the railroad and earnestly desire its completion, which is said will be on or about the 1st of May, 1881. Times in Guaymas have greatly improved and there is a great rush of American immigration, some remaining in these cities to establish business and many going into mining districts in the interior of the State. Mexico now extends a warm and hearty welcome to American immigration. The jealous feeling which has for many years existed between the two republics has entirely died away.

## THE ENGINEER.

## First Principles.

There is such a harmony in science, its various departments are so closely connected and correlated, that the knowledge of first principles is not only a necessity, but, in fact, if properly understood, forms the means of an extensive and correct practical application. Without the understanding of the principles which underlie a science or practice, the most practical of men will enact or repeat the grossest blunders. Practice forms a not-to-be underrated means of teaching principle, but it often requires a long experience, great practice and at all times good judgment to deduce principles, which an intelligent study of the theory of the science will convey to us in a shorter time and more satisfactory way. Practice should constitute the embodiment of known principles and the means of deducing new ones, but not, as is now often the case, a method of teaching or verifying old, well known principles, which have long been accepted, and knowledge of which would have prevented a needless expenditure of time and money.

The greater portion, if not the whole, of the work of finding the necessary strength of bridges can be reduced to an application of the principle of moments, and similarly the strength of the working parts of the steam engine is, to a great extent, an application of this same principle. The numerous failures of roofs of buildings are solely due to a lack of knowledge of first principles. As a general thing the architect scorns the use of the formulae of mechanics, of which he is too often grossly ignorant. The "rule of thumb" is the favorite method adopted, and consequently when a roof is designed for a building of a form and size which has not come within his previous experience, or that of his immediate advisers, the proper additional and required strength or "the extra inch of timber" is guessed at in a slipshod manner, instead of being calculated, and a truss constructed fully able to successfully withstand the strain to which it is subjected.

"Accidents" like that of the Hippodrome and of the post-office, New York, where one might have justly expected that the best talent would have been secured, were due to the fact that instead of applying the fundamental laws of mechanics to compute the required strength, the architect thought the roof was strong enough—a matter of guess-work and not of positive knowledge, as was within his power to have. The Tay bridge disaster was in the main due to the neglect of not considering the effect of the pressure of the wind. In the construction of the Hudson River tunnel, attention was not paid to the universal law that that portion of a structure which is most constantly used, and upon the strength of which the safety of the remainder of the structure and its occupants depends, should possess sufficient strength under the most adverse conditions possible. The principles of the conservation of energy are the basis of all our reasoning relative to the transformation of energy in various modes of motion, and without a knowledge of these principles we must inevitably fall into error, and endorse valueless schemes for realizing fabulous power. In ordinary discussions in technical journals, especially in communications, the general lack of the fundamental principles is being constantly exposed. We propose to enter this subject of first principles more thoroughly, and especially to present the views of some of our more prominent engineers upon the value of the knowledge of the first principles in particular, and more important branches of the engineering profession.

## Continental Railroads.

At the rate railway building is progressing and new projects are undertaken, says the *Iron Age*, this continent will not lack for means of transportation between the Atlantic and Pacific. Not to mention De Lesseps' canal and the rival one that is proposed to build through Nicaragua, and ignoring Capt. Eads' ship railway, four lines of railway are built or building to connect the Atlantic slope with the Pacific. The Union and Central are the completed lines. The Southern was to have been ready Jan. 1st, but will hardly be finished before March 1st. The Northern Pacific has been put into the hands of a construction company to build, and is to be pushed to completion, while the details of the agreement for the construction of the Canadian Pacific, which provides that it shall be completed before Jan. 1, 1891, are at hand. When these are all done, he who wishes to see the big trees can have a choice of routes. What the effect of the completion of these lines will be on the course of trade it will be impossible to tell, but he would be regarded as a wild enthusiast who should predict what will be, probably, a reality hereafter many years. Albert Richardson in an article apostrophized New York and San Francisco as the two cities that should yet contest for the commercial empire of the world. This may not be all prophecy with no realization.

AUSTRALIAN GOLD.—Official statistics show that Australia has supplied England during the last five years with \$131,738,000 in gold coin and bullion.

## USEFUL INFORMATION.

## Remarkable Echoes.

In the sepulchre of Metella, the wife of Sulla, in the Roman campagna, there is an echo which repeats five times, in different keys, and will also give back with distinctness a hexameter line which requires two and a half seconds to utter it.

On the banks of the Naha, between Bignon and Coblenz, an echo repeats 17 times. The speaker may scarcely be heard and yet the response is loud and distinct, sometimes appearing to approach, at other times to come from a great distance.

Echoes equally beautiful and romantic are to be heard in our own islands. In the Abercorn family at Paisley, when the door of the chapel is shut, the reverberations are equal to the sound of thunder. If a single note is breathed, the tone ascends gradually with a multitude of echoes, until it dies in soft and hewitching murmurs. In this chapel is interred Margery, the daughter of Bruce and the wife of William Wallace.

The echo at the Eagle's Nest, on the banks of Killarney, is renowned for its effective repetition of a huckle which seems to be repeated by a hundred instruments, until it gradually dies away in the air. At the report of a cannon the loudest thunders reverberate from the rock and die in seemingly endless peals along the distant mountains.

At the Castle of Simenetta, a nobleman's seat, about 20 miles from Milan, a surprising echo is produced between the two wings of the building. The report of a pistol is repeated by this echo 60 times; and Addison, who visited the place on a somewhat foggy day, when the air was unfavorable to the experiment, counted 56 repetitions. At first they were very quick, but the intervals were greater in proportion as the sound decayed. It is asserted that the sound of one musical instrument in this place resembles a great number playing in concert. This echo is occasioned by the existence of two parallel walls of considerable length, between which the wave of sound is reverberated from one to the other until it is entirely spent.

A NEW LIQUID GLUE.—To produce good glue size, dissolve in a copper pan heated by indirect steam, four and one-half to five lbs. of soda in 20 lbs. to 24 lbs. of boiling water; then add to it, stirring well at the time, 30 lbs. of powdered resin, keeping the whole continually boiling until the resin is perfectly dissolved. This soda-resin composition, dissolved in the proportion of one lb. of resin to 30 lbs. or 40 lbs. of water, is to be mixed well together with a glue solution, made by dissolving 10 lbs. of glue in about 30 lbs. to 40 lbs. of water; then boil up both solutions together for about 10 minutes, after which run it through a fine sieve or filter, and it is then ready for use. The best proportions for mixing the vegetable and animal size are for one and a half parts resin add one part glue.

PRESERVATIONS OF WOOD.—The method of preserving wood by the application of lime, as pursued by M. Svostal, is published in the French journals. He piles the planks in a tank, and puts over all a layer of quicklime, which is gradually slaked with water. Timber for mines requires about a week to be thoroughly impregnated, and other wood more or less time according to its thickness. The material acquires a remarkable degree of hardness on being subjected to this process, and, it is alleged, will never rot. Beech wood had been prepared in this way for hammers and other tools for iron works, and it is said to become as hard as oak without parting with any of its elasticity or toughness, and to last much longer than when not thus prepared.

NEW MATERIAL FOR BRICK.—Blast-furnace slag, that most hopeless of all waste substances, is now utilized to a great extent. It is converted into sand, mixed with a certain proportion of siliceous lime, and manufactured into bricks which possess many advantages over the ordinary bricks of commerce. By reducing the slag to a fibrous condition a material is produced which is usefully employed as a non-conductor of heat in clothing steam pipes and boilers. It is used in the manufacture of glass bottles and glass railway sleepers. But the most recent invention in slag utilization is in the production of a pure, white cement of greater strength than the best Portland cement.

PHOSPHORESCENT LAMP FOR MINERS.—The latest and not the least promising application of luminous paint is in the production of a safety lamp for coal miners. It is said to give light enough for practical use, and it is obvious that, in containing no fire, it is absolutely free from risk. By this invention, in connection with compressed-air blasting, fire and the attendant danger of exploding fire damp might be ruled out and the most dangerous mines made comparatively safe.

FROZEN POTATOES.—When potatoes are frozen the amount of sugar they contain is doubled, the starch undergoing a corresponding diminution, while part of the protein passes from the coagulable into the soluble form. During the process of rotting the potato loses half its nitrogenous constituents and the whole of the sugar.

## Glass Cloth Made in Pittsburg.

One of the chief characteristics of glass is brittleness. "As brittle as glass" is a comparison frequently made, but, notwithstanding this marked characteristic, glass is susceptible of being spun and woven into fabrics as perfect, delicate, durable and handsome as the finest silk. Glass has been spun and woven in Austria for a number of years, but not until recently has this feat been attempted in the United States. A prominent Pittsburg glass manufacturing firm, Messrs. Atterbury & Co., saye the *American Manufacturer*, have provided themselves with facilities for producing various kinds of fabrics from this ordinarily brittle substance, some of which they have already made. Among the articles they are prepared to exhibit are a napkin, a towel and tablecloth. The latter is about six ft. square, and white in color, except the ends and sides, which are a delicate green, and the four edges are fringed. The towel and napkin are the same as the tablecloth, except the ornamental border, which in one is red and in the other pink. These fabrics are as flexible and but slightly heavier than those woven of flax, and the manufacturers state that they can be washed and ironed, like the ordinary tablecloths and napkins. Besides these articles the firm have a number of large feathers made by them, which are fashioned of variously colored threads of glass, the base being a piece of brass wire. These feathers resemble ostrich feathers, and are wonderfully beautiful in shape and color. These goods Messrs. Atterbury & Co. will place on the market just as soon as there is a demand for them.

The firm can spin 250 of these fine threads, each ten miles in length, in one minute, the process being much more interesting than the spinning of cotton or other threads by the usual methods. The weaving is done with an ordinary loom, some of the machinery of which the firm have adapted to the requirements of the manufacture. The fabric cannot be ripped or torn, and can be sold at a less price than cotton, silk, or whatever other fabric imitated. The firm state that the cloth, whether coarse or fine, when worn as a dress or shawl, or other garment, will be just as warm, easy-fitting and comfortable every way as clothing of any other kind.

The firm are now fully prepared to receive orders for glass garments of any description.

CEMENT FOR UNITING LEATHER AND METAL. Wash the metal with hot gelatin; steep the leather in an infusion of nutgalls (hot) and bring the two together.

## GOOD HEALTH.

## Pertinent Facts About Eating.

In a recent number of the London *Standard* under the query, "Do we eat too much?" the writer gives many interesting facts. He says, for instance, that the amount of nourishment which a person needs greatly depends on his constitution, state of health, habits and work. A sedentary man requires less than one whose duties demand the exercise of his muscles, and a brain-worker needs more than an idler. But unquestionably the majority of us take more than we need. Indeed, food and work are distributed most unequally. The man of leisure is also the man of means, and accordingly fares sumptuously every day; while the laborer toils for eight hours and finds it difficult to get enough to repair the waste of his tissues. Yet a Chinaman or a Bengalee will toil under a tropical sun, and find a few pice worth of rice or jowar sufficient to sustain his strength. A Frenchman will not eat half what an Englishman engaged in the same work will demand, and a Spanish laborer, content in ordinary times with a watermelon and a bit of black bread, will toil in the vineyards and grow fat on a dietary of onion porridge and grapes.

It is true that Mr. Brasey, when building the Continental railway, found that one English navy was worth a couple of spare-fed foreigners. But, on the other hand, the British-Columbian and Californian gold-diggers, than whom a more magnificent set of athletes does not exist, live in the remote mountains of the far West mainly on beans flavored with a few cubes of pork. But they also obtain the best of water and the purest of air, and their outdoor life and active exercise enable them to digest every ounce of their frugal fare. The English soldiers, though better fed than those of any army except the American, do not get one-half the solid nutriment which the idler of club-loungers considers indispensable for his sustenance. An athlete in training is allowed even less food; yet he prepers on the limited fare, and prolongs his life by the regimen by which he has been subjected.

King Victor Emmanuel was a monarch of the most robust physique; yet he only ate one meal per day, and it is manifestly absurd for any man to require three more or less weighty meals, and an afternoon cup of tea, to support the exertion of walking to the club, riding an hour in the park, writing a note or two and dancing a couple of miles around a ball room. The ancients had their "amethusoi," or "sober stones" by which they regulated their indulgences at table. The moderns have not even this. But they have their gout and their liver to warn them, when it is too late, that nature has been overtaken.

## The Air We Breathe.

It is composed of one part of oxygen and four parts nitrogen. The former supports life, the latter extinguishes it. The more oxygen there is, the livelier, the healthier and the more joyful are we; the more nitrogen, the more sleepy and stupid and dull we become. But if all the air were oxygen, the first lighted match would wrap the world in instant flame; if all were nitrogen, the next instant there would not be upon the populated globe a single living creature. When oxygen was discovered by Priestley, nearly 80 years ago, there was great jubilation among doctors and chemists. The argument was plausible, and seemed perfectly convincing: "If oxygen is the life and health of the atmosphere, as we have found out how to make oxygen, we have only to increase the quantity in the air we breathe, in order to wake up new life, to give health to the diseased, and youth to the aged." But, on trial, it was found that it made a man a maniac or a fool, and if continued, a corpse. Various other experiments have been made to improve upon the handiwork of the Allwise Maker of the Universe, but they have been successive failures, and thinking men have long since come to the conclusion that, as there can be no improvement upon the cold water of the first creation in slaking thirst, so there can be no addition made to pure air which will better answer its life-sustaining purposes. And as there is not, in all nature, a still, warm atmosphere that does not instantly begin to degenerate decay, corruption and death, so there is no chamber of the sick, graduated to a degree, that will not hasten the end desired to be averted.

HIPPOPHAGY IN FRANCE.—Some very interesting statistics have been published by the society for promoting the use of horse flesh and the flesh of asses and mules as food, showing how steadily the consumption of these articles of diet has been increasing in Paris and the provinces since the foundation of the society in 1866. The weight has increased from 171,300 lbs. in 1866 to 1,932,620 lbs. in 1879. In the principal cities of the provinces the consumption of horse-flesh may be considered to have fairly taken root. At Marseilles, in 1870, there were 599 horses eaten, 1,031 in 1875, and 1,533 in 1878. At Nancy, 165 in 1873, over 350 in 1876, and 705 in 1878; at Rheims, 291 in 1874, 423 in 1876 and 334 in 1878; at Lyons, 1,839 in 1873 and 1,313 in 1875. In both the latter cases some difficulties had been thrown in the way by the town authorities, as was the case recently at Chalons-sur-Marne, where the Mayor fixed the price of the horse-flesh at a higher rate than that of beef. The average price of horse meat is from 25 to 30 cents per lb. Each horse furnishes about 200 kilogrammes (four cwt.) of meat, which is capable of being prepared in many by no means unappetizing ways, such as *pot-au-feu*, boiled, roast, hashed, haricot, juggled fillet, etc.

TOO MUCH CIGARETTE.—There is too much cigarette. The small boy has got it into his month, and it is using him up. The Philadelphia *Times* says physicians and other people in that city are pained by the spectacle, growing more common every day, of pale-faced lads, ranging in age from 6 to 20 years, who are puffing their little lives away in smoking. Day and night they throng the streets, where the peculiarly offensive odor generated by cigarettes made of cheap paper and bad tobacco renders their smoking as obnoxious to others as it is hurtful to themselves. Every evening before the doors of the theaters they raise a cloud of foul smoke that is equally injurious to their own rickety constitutions and to the noses of their victims. Doubtless, also, they carry their pernicious habit into their homes—when they are old enough to do so without risk of the spanking that they deserve—thus still further doing harm to themselves and making other people uncomfortable.

PHENOMENAL EXUDATION OF BLOOD.—The Chicago *Daily News* of Dec. 20th, says: The doctors are puzzled and interested by a peculiar case on the west side. A 14-year-old son of Wm. Crawford, captain of a tug boat, has for some years been sweating blood at times, and lately has had severe attacks which alarmed his parents. His infirmity comes on him usually after taking cold. Great black patches appear on his body, from which blood drops, the size of a pinhead, exude. Blood flows from his mouth, nose, ears, stomach, and even from his bladder and kidneys. No pain accompanies these discharges, but they make his blood thin, and weaken him. Sudden fright or excitement will easily check the flow. He is mentally bright, and his father, mother, brothers and sisters are strong and healthy. The physicians who have taken an interest in his case, propose sending him to Edinburgh and London, for examination by the Academy of Surgeons.

CURE FOR DANDRUFF.—Mr. John L. Davis, in the *Journal of Pharmacy*, asserts (having fully tested it in his own case), that a preparation of one ounce of sulphur and one quart of water, repeatedly agitated during intervals of a few hours, and the head saturated every morning with the clear liquid, will, in a few weeks, remove every trace of dandruff from the scalp, and the hair will become soft and glossy. He says: "I do not pretend to explain the *modus operandi* of the treatment, for it is well known that exhaled sulphur is almost or wholly insoluble, and the liquid used was destitute of taste, color or smell. The effect speaks for itself."

THE Puget Sound Courier says: Coal mining has begun in earnest at the New Carbon Hill mines, of the Puyallup. Last Tuesday 500 tons went over the road to Portland for the O. R. & N. Co. The present capacity is 100 tons per day.

## Physical Studies of Lake Tahoe.—No. 2.

(Written for the Press by PROF. JOHN LE CONTRE.)

## Transparency of the Waters.

All visitors to this beautiful lake are struck with the extraordinary transparency of the water. At a depth of 15 or 20 meters (49.2 or 65.62 ft.) every object on the bottom, on a calm, sunny day, is seen with the greatest distinctness. On the 6th of September, 1873, the writer executed a series of experiments, with the view of testing the transparency of the water. A number of other experiments were made, Aug. 28th and 29th, under less favorable conditions. By securing a white object of considerable size—a horizontally-adjusted dinner-plate about 9.5 inches in diameter—to the sounding-line, it was ascertained that (at noon) it was plainly visible at a vertical depth of 33 meters, or 108.27 English ft. It must be recollected that the light reaching the eye from each submerged object must have traversed a thickness of water equal to at least twice the measured depth. In the above case it must have been at least 66 meters, or 216.54 ft. Furthermore, when it is considered that the amount of light regularly reflected from such a surface as that of a dinner-plate, under large angles of incidence in relation to the surface, is known to be a very small fraction of the incident beam (probably not to exceed 3% or 4%), it is evident that solar light must penetrate to vastly greater depths in these pellucid waters.\*

At an angle of..... 8° 35' 000 were reflected  
 " " " " " 15° 150 " "  
 " " " " " 30° 51 " "  
 " " " " " 45° 23 " "  
 (Traité d'Optique, p. 125.)

Moreover, it is quite certain that if the experiments, in relation to the depths corresponding to the limit of visibility of the submerged white disk, had been executed in the winter instead of summer, much larger numbers would have been obtained. For it is now well ascertained, by means of the researches of Dr. F. A. Forel, of Lausanne, that the waters of the Alpine lakes are decidedly more transparent in winter than in summer. Indeed, it is reasonable that when the affluents of such lakes are locked in the icy fetters of winter, much less suspended matter is carried into them than in summer, when all the sub-glacial streams are in active operation.

The experimental investigations of

Prof. F. A. Forel,

On the "Variations in the Transparency of the Waters" of the Lake of Geneva (Archives des Sci. Phys. et Nat., Tome 59, p. 137, et seq., Juin, 1877), show that the water of this famous Swiss lake is far inferior in transparency to that of Lake Tahoe. Prof. Forel employed two methods of testing the transparency of the waters of Lake Geneva at different seasons of the year.

1st. The direct method, by letting down a white disk 25 centimeters (about the size of the dinner-plate used by me), attached to a sounding-line, and finding the depths corresponding to the limit of visibility. For the seven winter months, from October to April, he found, from 46 experiments in 1874-75, a mean of 12.7 meters, or 41.67 English ft.; and for the five summer months, from May to September, he found, during the same year, a mean of 6.6 meters, or 21.65 ft. The maximum depth of the limit of visibility, observed by him, was 17 meters, or 55.88 English ft.; being a little more than half the depth found by me in Lake Tahoe, early in the month of September.

2d. The other method, employed by Prof. Forel, was the indirect or photographic method. This consisted in finding the limiting depth at which solar light ceased to act on paper, rendered sensitive by means of chloride of silver. If we assume that the same laws which regulate the penetration of the actinic rays of the sun are applicable to the luminous rays, this method furnishes a much more delicate means of testing the transparency of water; and especially of determining how deep the direct solar rays penetrate. Forel found the limit of obscurity for the chloride of silver paper, in winter, to be about 100 meters, and in summer, about 45 meters; numbers (as we should expect) far exceeding those furnished by the limit of visibility of submerged white disks. Assuming that the index of transparency of the water of Lake Tahoe to be in winter no greater than twice that of Lake Geneva, it follows that, dur-

\*According to the experiments of Bouguer, out of 1,000 rays of light incident upon polished black marble, the following were the proportional numbers reflected at the several angles measured from the surface of the marble.

So few exact observations have been made on the transparency of sea-water, that it may be proper to add the following results obtained by Capt. Duperrey during the "Voyage de la Coquille." The apparatus employed consisted of a circular board 60 centimeters in diameter, painted white; to which a weight was attached, and so adjusted that when let down by a line the white disk descended horizontally in the water.

There are numerous lakes in the Scandinavian peninsula, whose waters are said to be very transparent; objects in the bottom being visible at depths of from 30 to 37 meters, more specifically, in Lake Wetter in Sweden, a fathoms is said to be visible at a depth of 20 fathoms, on 36.575 meters. But such vague popular estimates are scarcely worthy of consideration. Still less trustworthy are the unverified accounts we have, that in some parts of the Arctic ocean shells are distinctly seen at the depth of 30 fathoms; and that among the West India Islands, in 80 fathoms of water, the bed of the sea is as distinctly visible as if seen in air. (Somerville's Phys. Geog., Am. Ed. 1868, p. 199.) Perhaps it should have been put feet instead of fathoms.

ing this cold season, the solar light must penetrate the waters of the former to a depth of at least 200 meters. From his admirable photometrical investigations Bouguer estimated (Traité d'Optique sur la Gradation de la Lumière, La Caille Ed., Paris, 1760), that in the purest sea water, at the depth of 311 Paris ft., or 101 meters, the light of the sun would be equal only to that of the full moon, and it would be perfectly opaque at the thickness of 679 Paris ft., or 220.57 meters. In relation to the comparative transparency of different waters, we may be permitted to cite a few results obtained by the method of depths corresponding to the limit of visibility of white disks. Even absolutely pure water is not perfectly transparent; it absorbs a certain amount of light, so that at a determinate depth it is opaque. The following table presents us comparative results which may be of some interest:

Water.	Season.	Depth of visibility in meters.	Observer.
Lake of Geneva...	Summer	5.30	Min'm F. A. Forel
" " "	"	8.20	Max. " "
" " "	"	6.00	Mean " "
" " "	Winter	10.20	Min'm " "
" " "	"	17.00	Max. " "
" " "	"	12.70	Mean " "
Lake Tahoe.....	Summer	33.00	Max. Nobis
Pacific O., Wallis I.	"	40.00	Capt. Borard
Mediterranean near Civita Vecchia	"	42.50	P. A. Secchi
Atlantic O.....	"	49.50	J. L. F. de Pourtales

Inasmuch as our observations on the water of Lake Tahoe were made during the latter portion of August and the beginning of September, it seems probable, from Forel's results in Lake Geneva, that winter experiments would place the limit of visibility as deep, if not deeper, than Pourtales found in the Atlantic ocean. It may be proper to add that Prof. Forel does not ascribe the variations in the transparency of water of the Swiss lake with the season exclusively to the greater or less abundance of suspended matter; but also to the fact, which seems to be confirmed by the experi-

Angular Hailstones.

ments of H. Wild, that increase of temperature augments the absorbing power of water for light.

Place.	State of Weather.	Date of Obs.	Limit of Visibility.
Offak.....	Calm & Cloudy	Sept. 13	13 meters
Offak.....	Calm & Clear	Sept. 14	23 meters
Pt. Jackson	Calm	Feb 12 & 13	12 meters
Ascension I.	Favorable	Jan. (11 exp'ts)	9 to 12 meters

Vide Œuvres Complètes de "François Arago," 2d ed., Tome 9, p. 203—Paris, 1865.

It is evident that this cause is more efficient in summer than in winter: Superior transparency of waters in pools in limestone districts. But the transparency of the waters occupying pools in certain limestone districts, unquestionably far surpasses that of any of the Alpine lakes on any of the inter-tropical seas. The observations and experiments executed by the writer during his investigations—in the month of Dec., 1859—in relation to the "Optical Phenomena Presented by the Silver Spring," in the State of Florida, (Vide Proc. Am. Assoc. Adv. of Sci., vol. 14, p. 33-46; Aug., 1860. Also Am. Jour. Sci., 2d series, vol. 31, p. 1-12; Jan., 1861), indicated a degree of transparency in the water surpassing anything which can be imagined. The depth of this remarkable pool varied, in different portions, from 30 to 36 English ft., or from 9.14 to 10.97 meters; yet "every feature and configuration of the bottom of this gigantic basin was almost as distinctly visible as if the water was removed and the atmosphere substituted in its place." "The sunlight illuminated the sides and bottom of this remarkable pool, nearly as brilliantly as if nothing obstructed the light. The shadows of our little boat, of our overhanging heads and hats, of projecting crags and logs, of the surrounding forests, and of the vegetation at the bottom, were distinctly and sharply defined." The experiments in relation to vertical depth at which printed cards could be read, when viewed vertically, afforded a good illustration of the extraordinary transparency of these waters. Comparative experiments in relation to the distance at which the same cards could be read in the air, showed that when the letters were of considerable size, say 6 or 7 millimeters or more in length, on a clear and calm day they could be read at about as great a vertical dis-

tance beneath the surface of the water as they could be in the atmosphere. But it would be a grave error to imagine that these results indicate that sunlight undergoes no greater diminution in traversing a given thickness of this water than in passing through an equal stratum of air. For, in both cases, when the cards are strongly illuminated, the reading-distance is limited by the smallness of the images of the letters on the retina, and not by the amount of light reaching the eye. Nevertheless, these experiments prove conclusively that, at the depth of 10 meters, the illumination was sufficiently intense to secure this limiting condition, and thus serves to convey a more distinct idea of the wonderful diaphanous properties of these waters than any verbal description. The experiments were executed about noon at the winter solstice (lat. 29° 15' north), and were made on various-sized letters, and at depths varying from 2 to 10 meters. It would be exceedingly interesting to test the transparency of the waters of similar springs in the limestone districts by the limit of visibility of white disks, when the depth is sufficiently great to admit of the application of this method. The famous fountain, situated about 10 or 15 miles south of Tallahassee in the State of Florida, called Wakulla spring, is represented to be deeper than the Silver spring, and to be equally transparent. But we have, as yet, no trustworthy measurements, or observations in relation to the comparative diaphanous properties of the waters of other limestone pools.†

## Cause of Superior Transparency.

It only remains to indicate the causes which produce the extraordinary transparency of the waters occupying the Silver spring. It may be remarked that these diaphanous properties are perennial. They are not in the slightest degree impaired by season, by rain, or drought.

The comparatively slight fluctuations in the level of the water of the pool produced by the advent of the rainy season, are not accompanied by any turbidity of its waters. At first sight it may seem paradoxical that in a country where semi-tropical rains occur, the waters of this spring should not be rendered turbid by surface drainage. But the whole mystery vanishes when we consider the peculiar character

A German Horse shoe.

of the drainage of this portion of Florida.

Although the surface of the country is quite undulating or rolling, the summits of many of the hills being 30 or 40 ft. above the adjacent depressions; yet there is no surface drainage. There is not a brook or rivulet to be found in this part of the State. The whole drainage is subterranean; even the rain-water, which falls near the banks of the pool and bold stream constituting its outlet, passes out by underground channels. There is not the slightest doubt but that all of the rain-water which falls on a large hydrographic basin, passes down by subterranean channels and boils up and finds an outlet by means of the Silver spring, and the smaller tributary springs which occur in the cove along the margin of its short discharging stream. The whole surface of the country in the vicinity, and probably over the area of a circle of 10 or 15 miles radius, whose center is the Silver spring, is thickly dotted with lime-sinks, which are the points at which the surface-water finds its entrance to the subterranean passages. New sinks are constantly occurring at the present time. The beautiful miniature lakes whose crystal waters are so justly admired, which occur in this portion of Florida, are doubtless nothing more than lime-sinks of ancient date. Under this aspect of the subject it is obvious that all the rainfall on this hydrographic basin boils up in the Silver spring, after having been strained, filtered and decolorized in its passage through beds of sand, tortuous underground channels. It thus comes out, not only entirely free from all mechanically-suspended materials, but completely destitute of every trace of organic coloring matter. For this reason there is a striking contrast between the color and transparency of the waters of the Silver-spring stream and those of the Ochlawaha river at their junction, the latter draining a country whose drainage is not entirely subterranean.

The above-mentioned conditions seem to be fully adequate to persistently secure the waters of this spring from the admixture of insoluble and suspended materials, as well as from the discoloration of organic matters in solution. But, inasmuch as these waters appear to be more diaphanous than absolutely pure water, it is possible that the minute quantity of lime which they hold in solution, may exercise some

influence in augmenting their transparency. There is nothing *a priori* improbable in the idea that this optical, as well as the other physical properties of the liquid, may be altered by the materials held in solution. This is an interesting physico-chemical question, which demands experimental investigation.

## Angular Hailstones.

A remarkable hailstorm passed over Thymbra farm, on the plains of Troy, Asia Minor, some time since, on which occasion angular hailstones fell, similar to those figured in the accompanying engraving. Mr. Frank Calvert, in describing the phenomenon to the *Scientific American*, says: A gale was blowing at the time from the southward, when a sudden massing of dark clouds flying in various concentric directions was observed. As the clouds passed over the farm there was a heavy discharge of hailstones, for the space of about five minutes, which whitened the ground with an icy covering. The hailstones were above the average size. The remarkable feature, however, was the extraordinary shapes these stones presented, some of which were round or irregular with angular projections, others flattened with but two of these points. Shapeless masses of ice also fell. The stones were whiter at the core than on the external portion. To account for this phenomenon, it may be suggested that the upper portion of the cloud was suddenly converted to snow, which, falling and gyrating in the lower, formed the nucleus around which the vapor was condensed and frozen; while a rotatory motion gave the round form to the body, or added to the spherical nucleus of the snow, the angular portions of the crystals increased in size. The delicate arrangement of the original hexagonal crystals of the snow was destroyed, which explained the various shapes and irregular number of angles in the hailstones. The drawing is made from a sketch taken at the time, which represents the natural size of the hailstones. Violent gusts of wind, but no electrical discharge, accompanied the fall.

## A Curious Horse Shoe.

A few weeks since we took occasion to mention that a German manufacturer had invented a horse shoe composed of iron and hemp, which is said to be meeting with great favor. At that time we asked some German friends to favor us with a sketch from which to make an engraving. The suggestion met with a prompt response, and we this week give an engraving showing the new shoe.

It is of malleable iron, having a deep wide groove into which tarred hemp rope is firmly wedged. The rope protrudes beyond the rim of the iron and the whole is said to form a light and extremely serviceable shoe.

The advantages claimed for it are that there is no liability of the horse falling or slipping, no jerking or straining of muscles by an accidental or misstep. It is also thought to be a preventive of cracking, etc., of hoofs. Easier and surer walking is secured on the smoothest pavement.

These shoes are worked from the best iron made and fitted cold. The tough black oakum will last, it is claimed, as long as iron. The shoe made in this manner has, it is said, met the approval of Emperor William. We do not know of its being patented in this country, though it may be.

BULLION IN TRANSIT.—Some time ago, some bullion, shipped by Christ, Lark of Unionville, to San Francisco, was attached in the express car, at Reno, by Jerry Schooling, for the Arizona company's debts. It was expected that an interesting suit would result from the action of the Washoe county Sheriff, in attaching the bullion while in the possession of Welle, Fargo & Co. This point will not be decided, however, as the matter has been compromised. The *Silver State* says that Mr. Schooling retains possession of the bullion, but releases an attachment on Christ, Lark's store, at Unionville, which he also attached for the Arizona company's debts.

AT BODE, 54 claims were jumped on New Year's morning, and armed men are now in possession. This is done under the law that requires a certain amount of assessment work to be done before the end of the year. Many Mill Creek claims were taken in the same manner.

THE Central Pacific railroad folks are now taking out 700 tons of coal per day from their Almy mines, Utah, and besides supplying the Central Pacific, are sending coal to Arizona to supply the Southern Pacific locomotives.

THE *Nugget* says that the building of a railroad from Benson to Tombstone will begin in a short time. The arrangements have all been perfected, under the management of Mark L. McDonald, the well-known stock broker of San Francisco.

LOS CERRILLOS district, New Mexico, is to have a smelter.

## Adverse Claims in Mining Application.

The following circular of instructions has been received by the Register and Receiver of United States Land Offices throughout the country:

DEPARTMENT OF THE INTERIOR,  
GENERAL LAND OFFICE,  
WASHINGTON, D. C., Dec. 10, 1880.

Gentlemen:—In the matter of applications for patents for mining claims, where adverse claims are filed in the manner prescribed by law and the official instructions, you will in notifying the adverse claimant that he will be required to commence proceedings in a court of competent jurisdiction within 30 days thereafter, at the same time advise him that he will be required within 15 days after such suit has been commenced, to file with you a certificate of the clerk of the proper court that proceedings have been commenced, and the date thereof. It frequently happens that there is no court which has exclusive jurisdiction, and in certain States it is competent to commence such suit in any District Court of the State. It follows that the applicant for patent (the defendant), in order to prove that no suit has been commenced, would be compelled in such cases to furnish the certificate of every court in which the suit might have been instituted; while the adverse claimant can always, at the minimum expense and trouble, furnish the certificate of the court in which he has commenced suit. In case no certificate of the clerk of court shall have been filed with you within 45 days after the filing of adverse claim, the applicant for patent will be allowed to complete his entry upon making affidavit that suit has not been commenced by the adverse claimant. Very respectfully,  
J. A. WILLIAMSON, Commissioner.

THE ICE HARVEST.—Prosser creek, Boca and Camp 20 are the points at which natural ice is cut for the market below. Prosser creek is about seven miles below Truckee, where Prosser creek forms a junction with the Truckee river. Boca is about a mile and a half beyond, and Camp 20 about four miles still further down the Truckee river. These points, though considerably lower than Truckee are much colder, the thermometer at Prosser creek frequently being from 10° to 15° lower than at this point. At Boca, Wednesday morning it was 15° below zero. The low temperature of these points and the almost chemically pure water with which they are supplied, give them great advantage over any other section for the production of good marketable ice. At Prosser creek is located the works of the Summit Ice Co. At Boca the Pacific Ice Co. is located, and at Camp 20, the People's Ice Co., holds forth. The capacity of the Summit Co., is greater than either or both of the others. Mr. James McDonald is the foreman and J. B. Brogan the agent. They have had a hard fight to make this season against the snow. They have had between 60 and 100 men employed for a week scraping snow from off their immense pond.—*Truckee Republican.*

## A NEW TREATMENT

For Consumption, Asthma, Bronchitis, Dyspepsia, Catarrh, Headache, Debility, Rheumatism, Neuralgia and all Chronic and Nervous Disorders. It is taken

## BY INHALATION,

And acts directly upon the great nervous and organic centers, and cures by a natural process of revitalization.

## SENT FREE:

A Treatise on Compound Oxygen, giving the history of this new discovery, and a large record of most remarkable cures. Write for it. Address the proprietors, DR. STARKEY & PALLEY, 112 and 114 Grand street, Philadelphia, Pa., or H. E. MATHEWS, 608 Montgomery street, San Francisco, Cal., from whom can be procured both information and supplies.

People May Hear With  
**DEAF AUDIPHONES**  
OR WITH  
**EARPHONES.**

Trial before purchase. Don't waste your money otherwise. Send for free pamphlets. (Address H. E. Mathews, as above.)

Prize Medal, Mechanics' Fair, '80.

Paper Rulers & Blank Book Manufacturers  
505 Clay Street, (southwest corner Sansome),  
SAN FRANCISCO

JOHN A. CHURCH, E. M. PH. D.  
MINING ENGINEER,

Room 75, 115 Broadway, New York.

Agent for PADDOCK'S Ore Dressing Machinery.

Mining Machinery supplied.

San Francisco Cordage Factory.

Established 1856.

Constantly on hand a full assortment of Manila Rope, Seal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

TUBBS & CO.,

611 and 613 Front Street, San Francisco

## PACIFIC MACHINERY DEPOT.

H. P. GREGORY & CO.,

Nos. 2 and 4 California Street, San Francisco.

Importers and Dealers in every description of

**MACHINERY!**

Sole Agents for the Pacific Coast for

BUCKEYE

Engine Company.

J. A. Fay & Co.'s Wood-Working Machinery; Bement & Sons' Machinists' Tools; Blake Steam Pumps; N. Y. Belting and Packing Co.'s Rubber Goods; Sturtevant Blowers and Exhaust Fan; Tanite Co.'s Emery Wheels and Machinery; Payne's Vertical Engines and Boilers; Perry's Centrifugal Pump; Judson's Standard Governors; Dreyfus Self-Oilers; Gould Mfg. Co.'s Hand and Power Pumps; Eclipse Windmills; Diston & Sons Circular Saws; Otto Silent Gas Engine; Dues' Elevator Cups; Ballard's Oak Tanned Belting.

Also on hand and for sale A FULL LINE OF MILL AND MINING SUPPLIES.

## NOTICE!

ENGINEERS, DEALERS AND USERS OF STEAM PUMPS

Will Please take notice that we have taken the sole agency for the KNOWLES' STEAM PUMP, for the Pacific Coast States and Territories, and keep a full stock of Pumps and Duplicate Parts on hand at all times.

PARKE & LACY,

Nos. 21 and 23 FREMONT STREET.

San Francisco, Cal., September 23, 1880.

## GOLD SAVING

SILVER PLATED

Amalgamating Plates,

FOR QUARTZ MILLS AND GRAVEL CLAIMS.

ALSO, CHALLENGE SWINGING PLATES,

For use in Sluices for Saving FLOAT GOLD. Constantly on hand PLATES of all Sizes; are prepared to fill orders on short notice. Old Copper Plates Purchased. Replated or Gold extracted by our process, whereby we save the Copper and remove the Gold at a very small expense.

GEO. M. LEDERER & CO.,

731 MISSION STREET, - - - Opposite the Grand Opera House.

Send for Circular.

SAN FRANCISCO.

## LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!

PATENTS REISSUED 1868.

The "OLD RELIABLE" with improvements, making it

THE MOST PERFECT TURBINE NOW IN USE,

Comprising the Largest and the Smallest Wheels, under both the Highest and Lowest head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for New Prices, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address,

JAMES LEFFEL & CO., Springfield, Ohio,  
and 110 Liberty St., N. Y. City.

## REMOVAL.

JUSTINIAN CAIRE,

IMPORTER AND DEALER IN

Assayers Materials, Chemicals

AND MILL SUPPLIES.

Brass and Steel Wire Screens, Hardware and Fancy

Ooods, Opera, Field and Marine Glasses,

Optical Instruments, Etc.

Nos. 521 and 523 MARKET STREET, S. F.

The attention of Assayers, Chemists, Mining and Milling Companies is particularly called to the complete stock of Balances, Furnaces, Crucibles, Brass and Steel Wire Screens, etc., including all the necessaries for Assayers and Miners, as also for Milling men. An experience of 30 years in this line of business enables me to guarantee a strict attendance to the orders which my friends may entrust to me. Gold and Silver Tables and a full list of articles to be found in my store, to be had on application.

CUMBERLAND  
COAL.

2250 Tons of the best Hampshire

VEIN, ex "Armenia," direct from Baltimore, now discharging. For sale in lots to suit, by

R. D. CHANDLER,

118 and 120 Pacific St.

## INGERSOLL

Rock Drill and Air Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Coast.

GEO. R. FOARD, GEN'L AGENT,  
No. 18, First St., S. F.

## CAUTION.

To John B. Reynolds and the firm of Reynolds & Rix, and the Public generally.

Notice is hereby given that George R. Foard, of No. 18 First Street, San Francisco, is the sole authorized agent for the sale of our manufactures, consisting of Rock Drills, Air Compressors, and duplicate parts of either in the territory known as the Pacific Slope, formerly under the agency of John B. Reynolds, but now under the sole agency of George R. Foard; and that no other person or persons have any right or authority to represent themselves as the agents of this Company within the above mentioned territory.

Also, take notice, that all persons manufacturing, or using any Rock Drills, Air Compressors, or duplicate parts of either, manufactured by others, embracing in their construction the mechanical inventions and appliances covered by the Patents owned by this Company, will be prosecuted for such infringement.

INGERSOLL ROCK DRILL CO.  
New York, November 30, 1880.

## INGERSOLL

ECLIPSE ROCK DRILLS.

The Most Economical Air Compressors in the Market.

MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS & RIX,

49 Fremont St., S. F.

## SCHOOL OF

Practical, Civil, Mechanical and Mining Engineering,

SURVEYING, DRAWING AND ASSAYING,

24 Post Street, San Francisco.

A. VAN DER NAILLEN, Principal.

Send for Circular.

## BOILER COVERINGS.

Plastic Cement and Hair Felt, with or without the Patent "AIR SPACE" Method. Cement ready for use by the barrel.

G. C. FOWLER, No. 413 Pacific St., S. F.

## Metallurgy and Ores.

### Nevada Metallurgical Works,

No. 23 STEVENSON STREET,  
Near First and Market Streets.

Ores worked by any process.  
Ores sampled.  
ASSAYING in all its branches.  
Analysis of Ores, Minerals, Waters, etc.  
WORKING TESTS MADE.  
Plans furnished for the most suitable process for working Ores.  
Special attention paid to Examinations of Mines; plans and reports furnished.

E. HUEN,  
C. A. LUCKHARDT,  
Mining Engineers and Metallurgists

### JOHN TAYLOR & CO.,

IMPORTERS OF AND DEALERS IN

### ASSAYERS' MATERIALS, MINE and MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
GISTS' GLASSWARE AND SUNDRIES, Etc.

118 and 120 Market Street, and 15 and 17  
California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full Stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods both as to quality and price. Our *New Illustrated Catalogue*, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

JOHN TAYLOR & CO.

A. N. RIOTTE, H. KUSTEL, GUIDO KUSTEL.

Office, No. 320 Sansome street, Room 10.

### California Inventors

Should consult DEWEY & CO., AMERICAN and FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1880. Their long experience as journalists and large practice as patent attorneys enables them to offer Pacific Coast inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC BUREAU PRESS, No. 203 Sansome St., San Francisco.

## Formation of the San Francisco Peninsula

### Geology and Artesian Wells.

A proper knowledge of the various geological formations underlying the different portions of this city is very desirable, in view of the probability of obtaining water at different points. Owing to the extensive excavations made in the city for grading streets and lots, an excellent opportunity is now furnished to examine the strata thus revealed near the surface; and if all the data and facts concerning the different strata passed through in sinking the artesian wells that have been bored in this city, could be obtained, compiled and mapped, we could then have a good knowledge of the sub-strata.

The only person thus far who has taken any interest in collecting any facts on this subject, is Mr. C. D. Gibbs, curator of the department of mineralogy of the California Academy of Sciences. We published not long since a diagram made by him, showing an imaginary section through this city, and showing the location and depth of various wells.

At the last meeting of the Academy Mr. Gibbs presented some 200 specimens of rocks, etc., which he had collected during his leisure hours in the last two years, and he acknowledges that he has barely made a commencement of the work that should be done. The specimens are numbered and accompanied by a catalogue. They consist principally of sandstones, slates, serpentine rocks, and accompanying minerals. Several specimens of the same character appear for the purpose of showing the different localities in which they appear.

When Mr. Gibbs took charge of the department of mineralogy for the Academy there was no series of specimens representing the geological formation or the character of minerals to be found on the peninsula and in the vicinity of San Francisco. This was probably due to the fact that the place was too near home.

In presenting the specimens to the Academy at the last meeting, Mr. Gibbs said:

The principal rock of this vicinity is a fine-grained, compact, calcareous sandstone, which effervesces freely with acid. The prevailing color is blue or gray, but from the action of the weather and surface water it becomes a dirty brown by the decomposition of the protoxide of iron which it contains. Some of the dark blue sandstone is very rough and hard to drill. The sandstone in some places is traversed by small veins of carbonate of lime. In other places thin seams of quartz are found running in various directions.

Associated with the sandstones are beds of black or brown soft shale, seams of hard black slaty shale, and a hard blue shale. Iron pyrites are found on some of the sandstones and hard shales.

### Serpentinoid Rocks.

A belt of serpentine also occupies a large portion of the city, if one may judge by the occasional outcrop to be found for miles in extent southeast from Fort Point. Commencing at Fort Point, the extreme northern point of the city, where it forms a prominent ridge one and a half miles in extent, and culminating in a peak 400 ft. high, about one mile south of the fort, then sloping gradually towards Mountain Lake. It is seen again at Lone Mountain, near the center of the belt; also at Jefferson square, near the eastern limit of the belt (a short distance N. W. of the City Hall); it is there in contact with the sandstone. At the Spring Valley reservoir at Market street it forms a knob, near the center of the belt; the elevation of knob is 200 ft. It makes its appearance again south of Mission creek, at Alameda street and Potrero avenue; from here it extends along the ridge to Point San Quentin, about the eastern limits, and six miles from Fort Point.

And the Dry Dock at Hunter's point is excavated in a ridge of serpentine. This is near the western limit, and makes the west boundary of the belt about eight miles in length, and the width of the belt about one and a half miles. It is bounded on both sides by sandstone, which overlies it on the east, and underlies it on the west.

But within the limits of this serpentine belt, other formations are found. At Fort Point a body of sandstone and shale between 200 and 300 ft. thick is imbedded in the serpentine, and dips east. Again at the Herman street cut, north of the reservoir, is a well-exposed strata of sandstone formation, measuring 355 ft. thick, 42 ft. of fine blue sandstone being near the center, with 140 ft. of brown and black shale on the east, and on the west 176 ft. of black shale containing sandstone and calcareous boulders; the dip here is to the east, under the serpentine, and it overlies the serpentine on the west. Also at block 47 on Center street, near Potrero avenue, is a very hard blue sandstone 30 or 40 ft. wide imbedded in the serpentine. Other portions of the belt are covered with sand and alluvial deposits, the depth of which can only be told by deep artesian borings; no well in the belt that I have heard of has yet reached it.

The serpentines found in the city show a variety of colors, and are made up of hard, dark-colored round boulder-like masses filled with crystals of bronzed, and imbedded in a softer shaly serpentine. The Orphan asylum is partly constructed of the hard, dark-colored portions

of this rock. The principal colors are, dark olive green, light green, blue, brown, velvety-black, purple, yellow, reddish-yellow and bronzes.

Some of these serpentines contain amianthus in fine reticulated and lamellar seams, crystals of bronzed, white crystals, supposed to be brucite, and fine stellated white crystal, supposed to be nemalites.

Associated with the serpentine, are veins three or four inches thick of hydromagnesite (a hydrous carbonate of magnesia), also a yellow ochreous matrix containing traces of cinnabar, and a highly crystalline metamorphosed silicious rock, very hard, and colored yellow, green and white, and is susceptible of a polish. This rock is similar to the outcrop at the New Almaden mines.

Amongst the other minerals and metals found in the city are, cinnabar, pyrolusite (the oxide of manganese), native mercury, and I have also heard of gold being found in the seams of quartz traversing the sandstone, and in black sand in artesian wells, but have not seen any of it. The black sands on the beach contain gold, and have been worked.

At the southwest corner of Franklin park near Potrero avenue, is a stratum of fine molding clay, which I understand is used by the molders of brass or other fine castings, who take it away by this sack as they need it.

### A Notable Gift.

California is a mining country and has been since owned by the United States. It owed its existence as a State to mines and its prosperity was based upon them. Yet, in no country in the world, perhaps, has the State, as a State, paid less attention to mining matters. And in no other country where so many people had grown rich from an industry, has that industry been so neglected in its higher branches. Mining has never received any fostering care at the hands of this State, or from individuals of this State. It is only lately that any effort has been made to do anything in this direction, in the foundation of the Mining Bureau. Our State Geological Survey was nipped in the bud, and even the Bureau has not suitable quarters or money enough to carry out the objects for which it was formed in a manner commensurate to the needs of a great State.

When the State was asked by a great government to exhibit at its exposition a collection of the samples of its mineral products, it could not afford to do it; and it was left to the munificent liberality of a citizen of another State to help California out. Mr. Mackay's donation was all that allowed California to be represented at Paris. And his was one of the few gifts to the mining interest that has been made.

Now, however, comes another gentleman, closely identified with the mining interests of another State, and makes our city a present, in the manner expressed in the following letter:

SAN FRANCISCO, Dec. 31, 1880.

To Andrew J. Moulder, Esq., Secretary Free Public Library:—My Dear Sir: Believing in the doctrine that good books are the best and safest companions to be selected by young people, I wish to contribute my mite in improving the utility of your worthy institution by enclosing a check for \$1,000, to be invested in books on mining, metallurgy, geology, mineralogy, assaying, chemistry, and kindred sciences, on which subjects, I am informed, you have but few books.

Mining forms one of the great interests of the Pacific coast, and, while mere speculation is undoubtedly a detriment to prosperity, legitimate mining must largely contribute to our welfare. Intelligent mining can only be carried on by a study of the experience already made in our own and other countries.

Please, therefore, invest this sum in such books as you think will best attain the above object. I am very truly yours,

ADOLPH SUTRO.

Mr. Sutro has no doubt received the thanks of the library trustees; and he also ought to receive the thanks of the city supervisors, as being the first man, to our knowledge, to donate anything in this city to assist or foster in any way in our midst the industry by which so many of us directly or indirectly gain our living. Mr. Sutro's letter is a very sensible and plain one and to the point. Now, let some other gentleman follow suit in the same direction, and set up a similar collection of mining and metallurgical works in the State Mining Bureau room. Mining books are expensive, like all technical publications; and we have no complete sets in this city, as we ought to have.

We are sure that all persons interested in legitimate mining will join us in hearty thanks to Mr. Sutro for his very acceptable, timely and thoughtful gift.

LUNDY, or Mill Creek, a mining camp near here, was connected with Bodie on January 1st by a telegraph line. This place has been attracting considerable attention lately, owing to the eminently favorable results obtained in the milling operations of the May and Lundy mines. The Tioga district is also favorably regarded by capitalists.

DURING the year 1880 the total assessments levied on incorporated mines in Nevada county amounted to \$174,500. In Placer county the assessments foot up to \$205,200.

## Academy of Sciences.

The annual meeting of the California Academy of Sciences was held on Monday evening last, Prof. Davidson in the chair.

This report of judges and inspectors of election was read, and the following officers were declared selected to serve during the coming year; President, George Davidson; Vice-President, Justin P. Moore; Second Vice-President, Herman H. Behr; Recording Secretary, Charles G. Yals (of the MINING AND SCIENTIFIC PRESS); Corresponding Secretary, S. B. Christy; Treasurer, Elisha Brooks; Librarian, Chas. Troyer; Director of Museum, W. G. W. Harford; Trustees, Wm. Ashburner, Geo. E. Gray, Robert E. C. Stearns, B. B. Redding, Thomas P. Madden, Ralph C. Harrison, J. M. Macdonald.

### Annual Report.

The report of the Secretary showed an expenditure of \$7,500 for the year, and an overdraft at bank of about \$1,000. The Librarian's report enumerated 463 valuable books received as exchanges or donated during the past year. The Librarian said that his now lacked sufficient shelf-room, and fully three-quarters of the books were in paper covers, yet unbound, and at least 1,000 volumes required binding. The long interval since this Academy had published any book of its proceedings—the last being of 1876—had caused many valuable exchanges to cease sending them their publications. W. G. W. Harford, Director of the Museum, reported the receipt of many valuable specimens during the past year, among them a gift of 308 species of invertebrates, largely fishes, donated by the Smithsonian Institute. He stated that the benefactors were many, and the donations received the past year highly important. Especial thanks were acknowledged to B. B. Redding for his constant and almost unrelenting additions to every department of the Academy's Museum. C. D. Gibbs, Curator of Minerals, reported continual gifts which had largely increased and now outgrown all case-room, and many, after examination and classification, had been packed away in boxes, to await the time when the Academy would have more room; 778 specimens of minerals have been received during the year.

### Prof. Davidson's Annual Address.

The President then read his annual report for the year. He said, although the Academy had no ready money, its prospects were not as gloomy as last year. Then they were apparently going behind, but now times have improved, and he believed this year the Academy will be free from debt. From lack of ready money they had published no proceedings for three years. Agassiz, Gray and Hooker had told the members when here that the vitality of the Academy would certainly be judged by its published proceedings, and without these its work was like a talent laid up in a napkin, without benefit to anyone. A thousand dollars a year is fully required to keep up the Academy's annual proceedings. At the East, rich men contribute eagerly to such a purpose, and proceedings thus published bear the imprint, "Published by the George Peabody Fund," and thus insert the name of whoever the donor may be. The Academy's property on Market St. is at present depressed in price, but the trustees have it continually in view, and will attend to its disposition or utilization at the proper time. The officers, trustees and curators work in full harmony, without any pay, one person only receiving a very moderate salary as custodian of the property. He stated that there was a widespread interest abroad in the work the Academy was now doing.

The remainder of the address consisted of a very scholarly and scientific essay on the benefits of scientific investigation, and the relations of science and industry.

### News in Brief.

SLIGHT earthquake at Tehama on the 3rd inst.

HEAVY rains have caused great damage in Sicily.

SEA LIONS are destroying the fish in Monterey bay.

THE upper Columbia river is again open to navigation.

TWO envoys of the King of Abyssinia have arrived at Paris.

THE 34th case of cremation has occurred at Gothau, France.

NAPA City has adopted a stringent ordinance on the opium question.

THE decrease in the public debt during December was \$5,699,430.

THERE have been heavy falls of snow in Georgia, Louisiana and Texas.

THE Government is feeding the destitute Wallapai Indians, Arizona.

THE New York tenement house fire on Thursday, caused a loss of nine lives.

THE recent sleet storm in Oregon damaged orchards to the extent of \$30,000.

THE Chileans had arrived within 20 miles of the Peruvian Capital December 23rd.

THE total expenditure of the Canada Pacific to the end of November was \$18,500,000.

THE gross revenue of the United Kingdom for the quarter ending January 4th, was £19,500,000.

THERE are nearly 10,000 cords of wood piled up at Brown's station, on the Virginia and Truckee railroad.

By an accident on the Sioux City and Omaha railroad Tuesday, six men were killed and nine were badly injured.

THE annual report of the Union Pacific shows gross earnings of \$25,000,000, a large increase over the previous year.

TRAMPS in considerable numbers are beginning to arrive in Los Angeles from Arizona. They say that the Territory is overrun by people who get there by way of New Mexico, Nevada and Colorado, as well as California.

THE Panama Star and Herald of the 25th of December says the foreign fleet will shortly be the most powerful ever seen in the Pacific. H. B. M. steamship *Garnet*, recently in the Pacific, is reported in quarantine at Montevideo with yellow fever on board.

A. D. GOODRICH, manager of the transportation company, which had charge of the wrecked steamer *Alpena*, declares untrue the finding of the coroner's jury at Grand Huron, Mich., that the *Alpena* was unseaworthy, manned by an inexperienced crew and without proper life-saving apparatus.

## San Francisco to San Diego.

Persons who wish to take a short sea voyage for health or recreation will find the best route from San Francisco, especially in winter, in the direction of San Diego. If used to sea travel they can make it an enjoyable trip. There is always more or less agreeable company en route to Port Harford (San Luis Obispo landing), Santa Barbara, San Pedro (Los Angeles landing) and San Diego.

Leaving San Francisco at 9 A. M., the Pacific Coast Steamship line land their passengers at Port Harford about 7 o'clock next morning; at Santa Barbara about 7 P. M., San Pedro on the following morning. Here the steamer tarries till evening and reaches San Diego early the next morning.

For \$2 passengers may go by lighter up the harbor to Wilmington, where they take rail for 22 miles to Los Angeles. There they have five hours to wander about the picturesque town, with its air of American go-aba-dative-ness, mingled with a touch of Mexican *siesta-like* character which is pleasant after the bustle of a big city. After this five hours of observation they return to the steamer in time to proceed to San Diego that evening, arriving there next morning.

One who has never visited this semi-tropical part of California will be surprised to realize how much of real interest can be seen, and how much pure enjoyment had in so short a time.

It is an item of interest, while passing down the coast between Point Conception and Santa Barbara, to observe the surface of the water for leagues in one locality covered with petroleum issuing from springs in the ocean bed. In sunny weather the floating oil is tinted with all the varying and changing colors of the rainbow. The sea here is always smooth; that is, glassy, but of course the ocean swell is ever present.

At Santa Barbara the passengers usually have two hour time to take a mile and a half walk over the wharf and through the main business street of the ancient town. On a recent trip the writer found the time to take this walk and spend a half hour comfortably at the celebrated and finely located Arlington House.

The steamer makes San Diego early on the morning of the third day from San Francisco. The fare from San Francisco to San Diego in the cabin is \$15, and in steerage \$10. To Los Angeles the fare is the same. When you go by railroad, however, the fare to Los Angeles is \$23.50. Altogether the ocean trip is a pleasant one to take, and as it does not consume much time or cost much money, it could be conveniently made by many of our city stay-at-homes with benefit to their health.

## Our Agents,

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. F. OSBORN—San Francisco.  
A. C. KNOX—Pacific Coast.  
O. W. MCGRAW—Santa Clara county.  
M. P. OWEN—Santa Cruz county.  
J. W. A. WRIGHT—Merced, Tulare and Kern counties.  
N. E. BOYD—San Bernardino and Los Angeles counties.  
JARED C. HOAG—California.  
B. W. CROWELL—Colusa and Yolo counties.  
D. W. KELLNER—Fresno, San Benito, Monterey and San Luis Obispo counties.  
V. O. WARNOCK, Sonoma county.  
M. P. OWEN—Santa Cruz county, Cal.

### Nothing Short of Unmistakable Benefits

Conferred upon tens of thousands of sufferers could originate and maintain the reputation which AYER'S SARSAPARILLA enjoys. It is a compound of the best vegetable alternatives, with the Iodides of Potassium and Iron, and is the most effectual of all remedies for scrofulous, mercurial or blood disorders. Uniformly successful and certain in its remedial effects, it produces rapid and complete cures of Scrofula, Sores, Boils, Humors, Pimples, Eruptions, Skin Diseases and all disorders arising from impurity of the blood. By its invigorating effects it always relieves and often cures Liver Complaints, Female Weaknesses and Irregularities, and is a potent renewer of vitality. For purifying the blood it has no equal. It tones up the system, restores and preserves the health, and imparts vigor and energy. For forty years it has been an extensive use, and is to-day the most available medicine for the suffering sick anywhere.

FOR SALE BY ALL DEALERS.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

**Mining and Other Companies.**

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

**DIVIDEND NOTICE.**

OFFICE OF THE

**Standard Consolidated Mining Company,**

SAN FRANCISCO, DECEMBER 31st, 1880.

At a meeting of the Board of Directors of the above named Company, held this day, Dividend No. Twenty-four (24), of Seventy-five (75) Cents per share, was declared payable on Wednesday, January Twelfth (12), 1881, at the office in this city, or at the Agency of The Nevada Bank of San Francisco, in New York.

WM. WILLIS, Sec'y.  
Office—Room No. 29 Nevada Block, No. 309 Montgomery Street, San Francisco, California.

**DIVIDEND NOTICE.**

OFFICE OF THE

**Silver King Mining Company,**

SAN FRANCISCO, JANUARY 4th, 1881.

At a meeting of the Board of Directors of the above named Company, held this day, a Dividend (No. 13) of Twenty-five (25) Cents per share was declared, payable Saturday, January Fifteenth (15), 1881, at the office of the Company, room 19, No. 323 Montgomery Street, San Francisco, California. Transfer books will be closed January Eighth (8), 1881.

JOSEPH NASH, Sec'y.

**DIVIDEND NOTICE.**

**The German Savings and Loan Society.**

For the half year ending this date, the Board of Directors of The German Savings and Loan Society has declared a dividend on Term Deposits at the rate of five and two-fifths (5 2/5) per cent. per annum, and on Ordinary Deposits at the rate of four and one-half (4 1/2) per cent. per annum, free from Federal Taxes, and payable on and after the fifteenth (15th) day of January, 1881. By order, GEORGE LETTE, Sec'y.  
San Francisco, December 31, 1880.

**DIVIDEND NOTICE.**

**San Francisco Savings Union,**

532 California Street, corner Webb.

For the half year ending with thirty-first (31st) December, 1880, a Dividend has been declared at the rate of five and two-fifths of one (1) per cent. (5 2/5) per annum on term deposits, and four and one-half (4 1/2) per cent. per annum on ordinary deposits, free of Federal tax, payable on and after Monday, seventeenth (17th) January, 1881.  
LOVELL WHITE, Cashier.

**ANNUAL MEETING.**

THE ANNUAL MEETING OF THE

**Stockholders of the Silver King Mining Company.**

Will be held at the office of the Company, Room 10, No. 328 Montgomery street, San Francisco, on Tuesday, January Eleventh (11th), 1881, at 12 o'clock, noon, for the

election of a Board of Trustees to serve for the ensuing year, and for the transaction of such other business as may properly come before the meeting. Transfer books will close January Eighth (8th), 1881, at 12 o'clock, noon, and remain closed until after the meeting. San Francisco, December 20, 1880.

**Alpha Hydraulic Gravel Mining Company.**

Location of principal place of business: San Francisco, Cal. Location of works: Alpha Hill, Nevada County, California.

Notice.—There are delinquent upon the following described Stock, on account of Assessment (No. 2) levied on the nineteenth (19th) day of November, 1880, the several amounts set opposite the names of the respective Shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amt.
James Ireland, Trustee.....	10	1,000	\$200
John H. Hayes.....	14	200	40
William H. H. Hamilton.....	18	1,000	200
Alexander Girvin.....	19	500	110

And, in accordance with law, and an order of the Board of Directors, made on the nineteenth (19th) day of November, 1880, so many shares of each parcel of said Stock as may be necessary, will be sold at public auction at the office of said Company, No. 216 Sansome Street, San Francisco, Cal., on Monday the tenth (10th) day of January, 1881, at the hour of one (1) o'clock, P. M., of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of sale.

JAMES IRELAND, Sec'y.

**ST. DAVID'S.**

**A FIRST-CLASS LODGING HOUSE**

CONTAINS 113 ROOMS.

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from \$2.50 upwards.

R. HUGHES, Proprietor.

At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

**F. W. FULLER,**

**MACHINIST.**

419 SACRAMENTO ST., San Francisco.

## THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

### Sporting, Cannon, Mining, Blasting and HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

**No. 1 XX is the Strongest Explosive Known.**

**No. 2 is superior to any powder of that grade.**

PATENTED IN THE UNITED STATES PATENT OFFICE.

## DEWEY & CO'S

Scientific Press

Patent Agency.

(ESTABLISHED 1860.)

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered some inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

A. T. DEWEY,

W. B. EWER,

GEO. H. STRONG.

### New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. Ph. D., on "The Comstock Lode, its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DEWEY & Co., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. E. M. SLEATOR will act as their agent, and call on mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

## MOREY & SPERRY,

MANUFACTURERS OF

Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuously. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supply. Iron Work complete for Wood Frames, also

**SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.**

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

**MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.**

## STEIGER & KERR'S

CONTINUOUS DISCHARGE AND GRINDING PAN.

This pan is designed to receive ore direct from a rock breaker and reduce it to the fineness necessary for amalgamation, thus taking the place of the ordinary stamp battery. The cost of this Mill places it within the reach of all; and one point of advantage not to be overlooked is the fact that the cost of erection, which adds so much to the expense of the stamp mill, after it leaves the foundry is, in this case, reduced to a fraction, as the Mill is complete in itself, and requires no expensive foundations, bed logs, battery frames, etc., but can be placed in position in a few hours after it arrives on the ground, without the aid of skilled labor. This simple arrangement, durable as it is, is a most important improvement in the working of gold ore, as it enables parties to construct and erect a mill at half the cost of a stamp mill, and with a great saving of time, and size of mill building. Each pan is capable of reducing 10 tons of average ore in 24 hours, the ore being first broken in a rock breaker, small enough to go through a half-inch screen. There is an important point in the action of this Mill, to which we desire to call the attention of miners and millmen. We allude to the grinding and scouring action on the gold before it is discharged. The value of this point cannot be over estimated, and it is not necessary to do more than mention the fact, as it will be at once recognized by all competent millmen who examine the pan in operation, and especially by those who have had to deal with tarnished or rusty gold, as it is commonly called, and which is often encountered in our mines, and which is such a cause of loss. The plan of feeding is the same as in the stamp mill, either an ore feeder or hand feeding being adapted, as may be desired. Parties interested in mining and mills can see the Pan in operation by calling at the OCCIDENTAL FOUNDRY, STEIGER & KERR, 137 First St., S. F.

NO. 7 IMPROVED

## AIR COMPRESSOR.

### SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

With Adjustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

## "THE \$1,000 CHALLENGE"

### Ore Feeder for Quartz Mills.

OVER 750 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.

Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaker. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.

The Challenge Ore Feeders are now in Use in the following Mills, besides many others:

Sonsby.....	20	Stamp.....	Tuolumne county, Cal.
Sheep Ranch.....	20	"	"
Mahoney.....	40	"	"
Zelle.....	40	"	"
Placerville.....	40	"	"

Falher De Snek.....	20	"	"
Hidden Treasure.....	40	"	"

### Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeder, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, was replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King" Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Gruntsville, Nevada, but after a fair trial were discarded, and Handy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

Mr. H. W. GREENWELL, of the Tingman Mine, El Dorado Co., or any other person can make \$1,000 by disproving the acknowledged superiority of my "CHALLENGE" Feeder, in a competitive trial, side by side, with any other Feeder, on wet or sticky ores from any mine, and I will give \$100 to any one who will procure the acceptance of this challenge, and arrange for a fair and impartial test on merit.

I mean business, Gentlemen, "either put up or shut up."

## Magnetic Separation of Ore.

A great many attempts, of various kinds, have been made for the treatment of ore by means of electrical or magnetic appliances. A great many thousands of dollars have been spent in perfecting the processes and carrying on the experiments, but so far none of them have been made practicable on a large scale, or have come into general use. Within the past two years these attempts have been renewed, and several inventors in this city have been working hard to accomplish something in this line. Two or three of them are still working away to attain their object before making their inventions public.

The process invented within the past few years, which has made the most noise and attracted the most attention is Edison's. When it was announced that a large company had been formed in Oroville, Butte county, in this State, to work black sands and "hydraulic gravel" by Edison's process, everybody waited expectant to see results. It was then stated that this company were buying up mining ground here and there, which they intended to work by this process. And we were told that the California miners lost too much in their tailings (which we knew before), and that these tailings were to be worked over by the new machine at a great profit. Immense beds of tailings were said to have been bought up by the men who had secured the Edison magnetic ore separator.

It is now over a year since all this happened, but we have not been called upon to chronicle any great work having been done. We have frequently been asked what results had been accomplished, and we printed a few weeks ago a request for information on the subject. We gave some months since a brief description of the principles of Mr. Edison's apparatus, but now give a full description, which will be of interest to our readers.

The device is intended for the separation of the magnetic iron sand from tailings in placer diggings and hydraulic mines. It would seem somewhat impracticable, to say the least, to put any very large quantity through one machine, and it would take a good many to work the tailings of any one hydraulic mine.

In order to separate the magnetic from the non-magnetic particles, Mr. Edison arranges a hopper for feeding the sands or pulverized material, a magnet, and a receptacle for the substances, in such relation to each other that the trajectory of falling magnetic substances is altered, the magnetic and non-magnetic substances falling into different receptacles.

One method by which the process may be applied is as follows: A hopper, preferably provided with an adjustable valve orifice, and arranged to feed the mingled substance in a thin, broad stream, is supported in any suitable way several feet (more or less) above a bin, which is partly immediately under the feeding orifice of the hopper, so that material falling from the hopper would, under normal conditions, fall therein. Between the hopper and the bin, and to one side of the straight line connecting the two is a magnet having a polar extension, whose face is of a length equal to the width of the feeding orifice of the hopper. Underneath the magnet and by the side of the bin, is another bin for the reception of the magnetic substances. This part of the device can be arranged, of course, in any other convenient way.

The material fell from the hopper tends to fall in a straight line. As it rises, however, within the influence of the magnet, the magnetic portions are attracted thereby and move toward the magnet, which is so placed with relation to the falling material that it cannot be attracted entirely to the magnet before gravity has carried it past. In other words, the trajectories of the falling magnetic substance is altered, it moving for a portion of its fall in a line, which is the resultant of two forces—gravity and magnetism—acting upon it.

We have prepared engravings of Mr. Edison's apparatus, as arranged by himself, for carrying his invention into effect. Fig. 1 shows it partly in elevation, partly in section. Fig. 2 shows it submerged in water.

To any suitable support or frame work is attached a hopper, B, provided with a flat valve, B, adjusted by a screw, A, for regulating the thickness of the sheet of issuing material; a magnet, C, is supported below the hopper in any

suitable way. This magnet is provided with an extended polar face, c, of a length equal to the width of the feeding orifice of the hopper.

The polar face, c, is at one side of the line which the material would assume by force of gravity in falling from the hopper. This magnet, c, is connected by wires to a battery, generator or any suitable source of electricity. Beneath the hopper and magnet are the bins, as shown.

Supposing now the hopper to be filled with material partly magnetic, partly non-magnetic, the material infalling would, by force of gravity, fall as shown at F. The magnetic portions, however, are attracted toward magnet, c, but before they are brought over out of their path sufficiently to touch and cling to the pole, c, gravity

Fig. 1.

EDISON'S MAGNETIC ORE SEPARATOR.

has carried them past, and they fall as shown at F.

Instead of a magnet or magnets on one side, a magnet or magnets on both sides of the falling stream may be used, in which case the non-magnetic particles will fall in the center, the magnetic particles being drawn to one side or

side with its polar face extending through the side of the tank.

Our readers can see from the somewhat extended description the means and apparatus by which Mr. Edison was to work the tailings from our hydraulic mines, and can judge for themselves as to the practicability of any such device in this connection.

ALEXANDER AGASSIZ, curator of the museum of Natural History at Cambridge, Mass., has given not less than \$230,000 to that institution since 1871, beside making numerous gifts and subscriptions to other departments of Harvard University. Personally, says a writer in the *Harvard Register*, Mr. Agassiz is a bright, in-

Fig. 2.

HUSTON'S PATENT SHIPS' BERTH.

Few men at 45 years old are so full of vigor, or show more reserved vitality. Mr. Agassiz laid the foundation of his fortune by developing the famous Calumet and Hecla copper mines in the Lake Superior region.

SILVER REEF, UTAH.—The total bullion shipments of Silver Reef for the month of December footed up \$82,485.29, making a total shipment for the year 1880 of \$1,086,359.19, and a grand total shipment for the camp of \$3,800,502.96. The wise men of the schools, who not only declared it improbable that silver could exist in sandstone, but also asserted that it was impossible, can put the above in their pipes and smoke it.

THE furnaces at Clipper Gap, Placer county, are expected to begin melting ores in May. Their capacity is 40 tons a day. The ores are claimed to be of excellent quality.

## A Self-Leveling Ship's Berth.

Several contrivances have been designed for the purpose of alleviating the sufferings of those who are subject, when at sea, to attacks of the dreaded *mal de mer*, but none have afforded the much desired immunity from sea-sickness. Most of the appliances introduced to prevent sea-sickness have failed, either because they would not act at all, or, when they did, produced effects that were as bad as, if not worse than the malady. These contrivances have consisted of some modification of "swinging," but the roll of the vessel has not been even effectually lessened in its disagreeable effects by this method. There are many persons who are of so peculiar a temperament that the mere rocking of a boat induces nausea, while others can enjoy a channel yachting trip in rough weather without the slightest fear of those disagreeable sensations that have been so often described, yet fail to give even a scant notion of what sea-sickness really is.

It has been stated that "the immortal Nelson," among many others, although his profession necessitated a life afloat, was a martyr to sea-sickness, while many who have resided chiefly in country districts find nothing but enjoyment in a sea voyage, and can cross the channel when half a gale is blowing, without the least apprehension of unpleasant consequences. Among the many methods introduced that profess to afford relief are belts, medicaments, nostrums and devices, each and all of which have proved to be ineffectual.

It is necessary, in referring to the remedy, to consider the cause. The oscillation and rolling of a ship at sea tend to upset the normal condition of the individual, which, were it not for the particular tumbling action of the vessel, would not be affected. The invention to which we direct attention removes the cause, the result being that the effects are not felt, and hence the "Huston" berth is a "boon and a blessing." The peculiarity of this contrivance lies in the application of what is known as the universal joint, upon which the berth is poised, and is directed in its motion by a crescent-shaped weight, thus securing a perfectly level surface, no matter at what angle the vessel may pitch and roll. It is also controlled and regulated by india-rubber springs, preventing any tendency to jump up with a sudden jerk, and is strictly a "self-leveling berth." It occupies no more space than an ordinary berth, requires no expensive setting or adjustment, interferes in no way with the present sleeping arrangement on board ship, and can at once, if desired, be transformed into a fixed berth. Admitting the fact that sea-sickness is caused by the sufferer being forced by the law of gravitation out of his normal position, the inventor of the "Huston" self-leveling berth has adopted the universal joint principle, and thus enables a passenger to maintain a horizontal situation without being influenced by the motion of the vessel.

We see by the *British Trade Journal* that experience has proved that the invention affords relief and comfort, practical men and passengers have testified to the successful application of a most simple principle. The inventor has received numerous testimonials from persons expressing gratitude for the relief afforded. Among them is one from a private gentleman who recently took passage from Rio de Janeiro to New York in the steamship *City of Paris*. The writer, it would appear, had heard of the "Huston" berth, but had some doubts about its efficiency. His scepticism was dispelled, for he writes:—"This is a large steamer of 3,500 tons, handsomely fitted, and plenty of ice for cooling drinks. We have two cabins adjoining, and, strange to say, they are both fitted with Huston's patent berths, in which we feel very comfortable as the motion is scarcely perceptible."

THE new May Lundy mill, Mono county, has five stamps, 25 ft. of silver plates, blankets, clean-up pans, and the tailings are saved in a reservoir for future working. Of the 200 tons already worked, the yield has averaged \$65 per ton, and the proceeds are considered incomplete.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

### Amador County Mines.

EDITORS PRESS:—Plymouth is a mining town situated in a beautiful valley, or "plateau," sloping gradually to the southwest. The Empire mine is located near the center of the town and is the second mine in the county, in importance. This mine was first located by Simpson & Aden, in 1851. It is a fissure vein of gold-bearing quartz, and is supposed to be on the great "Vetro Madre," in which lie some of the richest quartz mines in the State. Two large hoisting engines are kept steadily running to supply the 80-stamp mill, which is propelled by water. Immediately south of this mine lies the "Pacific," under the control of the "Mining King," Alvin Hayward. This mine is just being developed. A large sum of money has been expended in putting up the latest improved machinery, now nearly complete. A large mill for reducing and extracting the ores will be erected next spring. Near 200 men are steadily employed in these two mines. The Alpine mine lies north adjoining the Empire. This mine is supplied with steam hoisting works and a 10-stamp mill, but has lain idle for five or six years. Some extremely rich ore was taken from this mine in 1862, by Wheeler & Hooper. X.

### Legislative Committees.

We append the names of members of the various committees of the Senate and Assembly, in order that our readers may know the individuals to whom bills are referred when sent to committee.

#### Senate.

Agriculture—West, Harlan, Burt, Langford, Glascock, Rowell, Hill, Carlock.  
Claims—Traylor, Davis, Enos, Post, West, Carlock, Zuck.  
Commerce and Navigation—Dickinson, Traylor, Nye, George, Ryan.  
Contingent Expenses and Mileage—Zuck, Carlock, Moreland, Nelson, Byrnes.  
Corporations—Sears, Johnson, Harlan, Kelly, Traylor, West, Pool, Brown, Dickinson.

Apportionment—Camron, McClure, Whipple, Paulk, Streeter, Gilmore, Bost, Daggett, May.

Municipal Affairs—Edwards, Whipple, Del Valle, Garrity, Van Fleet, McDonald, McClure, Mason, Lewis.

OUT ON ROCK CREEK.—We paid a hurried visit this week to the mine and works of the Auburn and Rock Creek mining company, located on Rock Creek, about three miles north of Auburn. Since our last visit, some two months ago, this company has done a great deal of work, and of a kind which indicates unmistakably that they mean business. Where men were then engaged in grading down the bank, a new 12-stamp mill now stands all ready, barring a few minor details, for operation. This mill is driven by an overshot wheel 32 ft. in diameter—one of the best in the county. It is supplied with pans and other appliances for saving gold, and in general details is the equal of any mill of its size that we have seen in this part of the country. While this mill has been building the mining operations have not been neglected. A force has been engaged all the time extending the levels and taking out ore, until at present there are over 300 tons on the dump ready to be crushed as soon as the mill is started up, which will not be later than next week. The mill is built near the shaft and hoisting works, and the arrangements are such that the rock is dumped from the car near the batteries, avoiding the expense of further handling or hauling. The ledge averages about seven ft. in width, and from such a body rock can be taken very fast. It is the intention to keep the mill going steadily when once fairly started. The 300 tons on the dump is mostly from the 130 level, and it is estimated that it will yield not less than \$20 per ton. The building of this mill and the general fitting up of the works have been done under the immediate supervision of Mr. P. M. Bowen, the president of the company.—*Placer Herald*.

### The Clays in the Comstock Lode.

At the last meeting of the San Francisco Microscopical Society a paper on the above subject, by Mr. Melville Atwood, of Sausalito, was read by Mr. Hanks.

As a preliminary to a statement of the results of my examination of the Comstock clays, I wish to say that I firmly believe that had the clays of the Comstock been carefully studied years ago, by the information obtained from that source, much time, and large sums of money, might have been saved in the discovery of the different large and rich ore bodies, and that even at this time a knowledge may be gained in that way which would greatly assist in directing the search for fresh or undiscovered deposits. For those in charge of the mines to acquire a correct knowledge of the character of the enclosing rocks of the lode, and the true condition of the mineralized silver and gold in the lode, would appear absolutely necessary for the successful extraction and milling of the different ores. There are comparatively inexpensive means of obtaining information, but nevertheless of the greatest importance. For instance, we frequently hear of rich strikes of "green chlorides" in some of the mines. Now, if such ore was really met with, the treatment of it in milling by "wet stamping" would be attended with the same results as that of wet stamping "black copper ore"—the loss of the greater portion of it. It does not appear very creditable, that after 20 years of mining and milling on the Comstock, that there are not wanting those who hold that a large portion of the gold found in the lode exists in a mineralized condition. Indeed, the way, so far as I can understand, in which they estimate their

### Loss on Treatment at the Comstock Mills.

Greatly favors that idea—the result of the cleaning of the mortars not being added to the battery pulp assays, so that they do not obtain a fair return of the gold contents of the vein-stuff under treatment, and consequently cannot correctly estimate their loss. At the different California quartz mills, a large proportion of the gold is usually found in cleaning out the mortars; so much so, that not long ago, at one of the mills in Mono county, it was found necessary to make use of a small bar and sledge hammer to loosen the gold, which had accumulated in such quantities in their mortars.

In the Virginia part of the lode, as late as May, 1859, and before the discovery of silver in that portion of the ground, the cradlings from the croppings of the lode were pounded in mortars with mercury, and the amalgam so obtained, when retorted, was, I am informed, sold for from \$6 to \$8 per ounce. The gold can now, by the aid of a batea, be washed out from the ore taken from the deepest workings: No. 1—Specimen of Comstock ore, with gold from the croppings of the Mexican mine, taken out of Comstock rocker June 22d, 1859. No. 2—Comstock ore, with gold from the fifth gallery of the Ophir mine. No. 3—Comstock ore taken from the deep workings of the Consolidated Virginia mine. No. 4—Gold mounted on slide, which was panned from a small quantity of No. 3 ore. The Comstock gold is very much alloyed with silver, and consists, of gold, 55.37; silver, 44.93. The clays of the Comstock are found on the foot, and what is called the banging walls of the lode, and from the "sides" of the rich ore bodies met with in the different branch ore fissures, also occupying the upper portions of such fissures or rents where there is no ore except the small rounded pieces mixed with it. It is very evident that the clays were formed subsequent to the quartz-heated waters acting upon and decomposing parts of the enclosing rocks, and the rounded character of some quartz-vein-stuff and country rock, met with in the clays, was the result of the mechanical wearing from the movement of the beated waters. The rounded pebbles of quartz with ore in them are found in such positions that they must have been brought up from greater depths. The same may be said of the pieces of country rock, which in many cases were not the same as that "cheeking them," or at the same level. The clays which I examined were taken from my private collection. Unfortunately, I had not any from the foot-wall.

### The way in which I made the

#### Examination of the Clays

Was first to place them in a porcelain dish, pouring hot water over and keeping them in the water for several hours, stirring occasionally till all the particles that would dissolve were taken up by the water. Afterwards I emptied the contents of the porcelain dish into a batea, allowing every thing that was dissolved to float away. By the batea the pyritic matter and other heavy bodies were separated from the rest of the coarser, rounded and lighter fragments of vein-stuff and country rock. The pyritic matter is then tested for gold, silver and tellurium, and also a microscopic examination of it is made under water. The fragments of country rock and vein-stuff are then washed again, using a brush to rid them of any clay that might still adhere to them. After drying they are put into a separator, having sieves with 30, 50 and 100 holes to the linear inch—a uniform size enabling me to examine them better with the microscope. The fragments that pass through the sieve having 100 holes, I place in a small cell, fastened on the glass slide and filled with water, which I cover with thin glass—the shape of the fragments are seen much better in this way, since by slightly moving the thin glass cover, they can be made to turn and exhibit

their forms in different directions. From the larger pieces of rounded

### Country Rock Met With in the Clay.

I cut sections. No. 5 is one of them, cut from a piece of about 4.10 of an inch in diameter, and which I send for your inspection. The rock from which it was broken is a trachytic diorite with a grayish-green groundmass of plagioclasic feldspar. It is rich in minute black particles of magnetite. Some of the hornblende is of an emerald green color, slightly fibrous. There also appears to be little patches of what is called "viridite." The feldspar in this rock has comparatively undergone very little alteration. Nos. 6 and 7 are sections taken from the enclosing east and west rocks of one of the richest ore bodies yet met with on the Comstock. You will see that they are of the same character, and as little altered as that found in a rounded state in the clays. This fact of the trachytic-diorite being found to the east and west of the ore body, and the absence of what is called the "black dykes" goes far to prove, if any proof is needed, that the richest ore bodies of the Comstock, for the most part only occupy portions of branch fissures, and are not usually met with in the main fissure. I have noticed that rocks on the Comstock which have undergone the greatest amount of alteration, and in which the feldspar is highly kaolinized are those where the planes in the jointed structure are of an open character, allowing the heated vapors from greater depths to rise through them; I find that with the exception of some of the larger grains being rounded, that apparently no change has taken place in the iron pyrites during the decomposition of the rocks, of which it formed a small part.

### The Clays Contain

On an average about 2% of pyritic matter, about the same proportion as that in the rock before decomposition; the pyrites in some instances give a small return of gold and silver. The magnetite found mixed with the pyrites after panning, I separate by placing the whole in water, and then making use of a small bar magnet. The fine sand which passed through the sieve having 100 holes to the square inch, contains a large proportion of quartz, and also small calcareous granules mixed with the undecomposed feldspar. The fragments of quartz are much corroded. I very much regret my want of adequate optical apparatus, which prevented my making as thorough an examination of the Comstock clays as I could have wished.

### Mine Examinations

So many of our society are more or less interested in the examination of mines, must plead my excuse, if any be needed, for calling your attention to a little device, which I have lately used with very satisfactory results in my underground examinations. The want of sufficient light has always been felt, and was a great drawback in our underground examination. In England large-sized candles were purposely made for the use of the underground superintendents. A great deal of skill and practice are required in the management of the candle underground, and by that means the close observer will easily distinguish between the "expert" and the practical miner. The candle is generally carried in the left hand, and the right is used to shade the eyes from the light. My device is a small glass reflector, one of which I submit for your inspection. It fits the hollow of the right hand, and by holding the candle before it with the left, a strong light may be thrown at pleasure in any direction, and to a considerable distance, enabling you to see the roof of the drift and cross-cuts and slopes which you otherwise would not be able to examine. I carry the reflector in a small pocket in the right-hand side of my underground coat.

### Tioga District.

This district lies 35 miles south of Bodie, on the summit of the Sierra Nevada mountains, and at the head of Bloody canyon, partly in Mono and partly in Tiolumne county, and is equidistant (110 miles) from Modesto and Oakdale, the nearest railroad points. The district was located by Eugene Bauharnais Burdick, a mining man well-known throughout California and Nevada, October 18, 1878, since which time some 500 claims have been located. The mineral belt and veins (which are very large) have a general northeast and southwest course, the mineral belt extending from Mount Dana to Mount Gibbs, a distance of three miles, and the veins having an easterly dip of about 90 degrees. The west country rock is granite, with a porphyry gangue, and the east country is syenite, the metal being chiefly silver in the sulphuret form. A chain of beautiful lakes, linked by living streams, spreads over the district, and the timber is large and everywhere distributed. The ledges are very large, being all the way from 10 to 200 ft. in width. The principal locations on the Mount Dana end of the belt are the Mount Dana, Ahmego, Bevan, Burdick Zahriske or Lake, Tiptop, Chief of Tioga, Austin, Mount Lyell and Yellow Jacket, while the locations on the Mount Gibbs end considered of the greatest value are the Faith, White Horse, R. A. Sawyer, Yosemite, Kanawah, Mount Dana No. 2, Enterprise, Helena, Lucky Jack and Golden Crown. Work is being actively prosecuted on the Mount Dana and others and will be kept up all winter, ample supplies having been laid in and comfortable quarters erected for the miners.—*Free Press*.

## MECHANICAL PROGRESS.

## The Reese Fusing Disc.

We gave, some weeks since, a brief notice of the above named device, which is in reality "an apparatus for cutting cold steel by a current of air." It appears that the device has attracted considerable attention abroad, and that the editor of the London *Engineer* has written to the inventor, Mr. Reese, of Pittsburg, Pa., for an explanation of the principle and operation of the machine, which is given in the *American Manufacturer* as follows:

"At first glance the machine seems to resemble a cold saw, but its action has nothing in common with that of the saw. It is well known that a disc of soft iron, caused to revolve at a very high velocity, will cut a hard piece of steel through, if the steel be brought in contact with the edge; but the Reese disc, it is said, fuses a bar of steel across without touching the bar."

"This machine consists of a disc of soft steel, 3-16 inches thick and 42 inches in diameter, and making about 230 revolutions per minute, which give an angular velocity of 2,500 ft. per minute. The bar to be cut must be round, and it is placed in the chuck in front of the disc, and caused to make about 200 revolutions per minute in the same direction as the disc; that is to say, the edge of the disc and the surface of the bar move in opposite directions. Thus adjusted, the disc not touching the bar, but close to it, a round bar of steel, 1½ in diameter, can be fused in two or ten seconds, the appearance of the cut, and the position of the disc with regard to it and the bar, being shown in the engraving. A, representing the round bar partially cut in two by the revolving disc, B, turning on its axis, C.

"It should be observed that the disc is only 3-16 inches thick, while the groove fused in the bar is 5-16 inches wide, leaving 1-16 inches of play at each side, and ½ inches clearance in front. 'We have,' writes Mr. Reese, 'adjusted the disc mandril on center, and satisfied ourselves that no lateral motion took place, and yet the air space always existed. The ends cut show no signs having been touched by the disc; the result of the fusion is metal, and the molten metal, while running down, may be handled by the naked hand without detecting but little temperature. The ends of the bar operated on become heated; the disc remains perfectly cool.' It must be understood that the phenomena that we have described are only present when the bar to be cut is caused to revolve. If the bar is not turned, the disc cuts its way through it as a cold saw would, but the discharge from the cut is not metallic, but an oxide of iron. The use of the fusing disc is, therefore, confined to round steel bars of moderate diameter."

"It is very difficult to explain the phenomena in question on any hypothesis consistent with our existing knowledge of molecular physics. That a bar of steel, caused to revolve close to the edge of a disc running a very high velocity, should be fused without contact taking place between the two, is a wonderful fact, which may stimulate the energies of ingenious minds for a solution for some time to come. Mr. Reese's explanation is that the fusion is due to the transfer of the mechanical energy stored by the air in the air flying from its rim into heat. The explanation is best given in his own words: 'The disc is surrounded with an atmosphere of air at a pressure, say 15 lbs. to the square inch. This air, by virtue of the motion of the disc, is thrown outward in radial lines, and is projected from the periphery. Temperature being the measure of molecular velocity, as weight is the measure of matter, it follows that the increased velocity acquired by the air in passing off the disc, will indicate a large increase of caloric. A part of this is drawn from the disc, which is thus kept cool, the remainder is obtained from the atmosphere. The increase of heat is not sensible, as it is occluded—latent—by the distended condition of the molecules. When the air is thrown off of the periphery of the disc, it tends to follow—or a portion of it—the disc, as our atmosphere follows the earth, the bar of metal impeding the flow of the air around the disc, the impact condenses the air, retards its velocity, unlocks the occluded heat, and fusion takes place. At the instant fusion takes place the molecular velocity of the metal is so suddenly increased, and is so great, that it possesses no sensible caloric above the atmosphere, all the balance being occluded; and as no occluded caloric can be unlocked except by reduction of the molecular velocity, the metal is,

therefore, apparently cold, though in a molten state. The more experience I obtain the more strongly am I impressed that the imponderable physical agents are the prime factors or all the chemical and physical phenomena we observe, and that physics should be more earnestly studied.

"Mr. Reese is a metallurgist of some standing, but it is not quite easy to follow him, or to extract his meaning from the passage which we have quoted; yet, on examination, it will, we think, become intelligible. If we conceive the disc to project a constant shower of particles of solid matter against a surface, it is clear that that surface would soon be raised in temperature, for the same reason that a wire becomes hot when hammered; and that the molecules of a gas are able to play this part is also known; but when we have got thus far we are left face to face with an aspect of the problem which Mr. Reese has not attempted to solve. Why should it be essential that the bar to be cut should be round and that it should revolve in the same direction as the disc? There appears to be no connection whatever between the revolution of the bar and its fusion. We shall, for the present, make no attempt to offer an explanation of the cause of the phenomena, because we are not as yet in possession of a sufficient number of facts. The explanation that at first presents itself is that fusion of a portion of the bar is set up at first by the disc coming in contact with it, and that the steel thus melted is burned by the air current, and that, in fact, the bar is burned through. It is well known that a small bar of rod iron, such as a nailrod, may, if heated to a bright red, be made white hot by blowing on it with a pair of smith's bellows. But if the bar were burned through, the discharge from the cut would be oxide of iron, whereas it is, according to Mr. Reese, metallic iron or steel. But when the bar to be cut does not revolve, then the discharge is oxide of iron."

**ANNEALING STEEL.**—There is much carelessness, says an exchange, in annealing steel articles which are to be wrought, and much trouble occurs from not properly softening steel before it is given to the bench workmen, the lathe man or the planer. There is a little of true cast steel that has any life in it that can be properly annealed by a heating in a forge fire, taking it out and holding it in the shadow, and then plunging it in water when it ceases to glow. It is poor steel that will not contract hardness when thus treated. When it is considered that a spring temper is so low that the amount of heat by Fahrenheit will give 579°, and that this heat will show no glow in the shade, it will be seen that this method of water annealing is not reliable. When a piece to be annealed has been heated to a red it should not be exposed to the air a moment, but be plunged into a bed of fine cinders, air-slacked lime or charcoal powder. The last is the best, and a dry bath of mingled lime and charcoal particles gives excellent results. There the piece should be left until entirely cold, or until the hand can bear its heat, and even then it is best to cool it in water.

**A NEW ELECTRIC MOTOR.**—Mr. William W. Griecorn is the inventor of a new electric motor which he exhibited before the Franklin Institute some time since. Its leading feature is the field magnet, which is made semicircular, so that all the magnetic lines of force are brought into the best possible position for effecting the revolution of the magnetic armature through which the current produced by a battery is sent. A small model weighing 2½ lbs. was attached to a sewing machine and a battery of six cells, each containing one plate of zinc four inches long and two inches wide. Dr. Norris, of the Franklin Institute, states that the machine did both light and heavy work, and the speed was under complete control. The battery was sensibly constant, showing no signs of polarization. The current was estimated at two webers per second and the force generated at 1,000 foot pounds.

**PUDDLING OF IRON.**—Mr. E. Harris, the President of the South Staffordshire Mill and Forge Managers' Association, in a paper which he had just read before the institute on the puddling of iron, said that the schemes tried to prevent smoke, save fuel, etc., might be counted by scores, but none of the recipes had been so effective as to secure a general adoption. It was a mistake theory to suppose that because iron was fibrous in the puddled bar it would be fibrous in the finished bar. Often enough the puddled bar was crystallized, and no matter how many times this class of iron was worked over again, fibers could not be developed. The "hot short" iron was as much to be guarded against as the "cold short," for while the engineer in constructing a bridge or building a vessel dreaded the "cold short" iron, the blacksmith and the hollermaker equally feared the "hot short."

**EXTERNAL CORROSION OF BOILERS.**—Reports of the Manchester association for the inspection of steam boilers show that many explosions are traceable directly to external corrosion, caused by damp or "sweat" formed between the walls in which the boilers are set. From this it appears that however important it may be to examine the interior of boilers, it is also of vital importance to investigate the outside, especially those parts which are either in immediate contact with the setting walls, or so covered by them as to prevent thorough ventilation,

## SCIENTIFIC PROGRESS.

## Atmospheric Ozone.

We find in the *American Chemical Journal* a highly interesting abstract of certain arguments advanced by Schoene, a German chemist of eminence, which seem to indicate that the proofs hitherto relied on to demonstrate the occurrence of ozone in the air are fallacious. For many years the presence of ozone in the air has been regarded as satisfactorily answered; the influence exerted by ozone upon those who breathe it has been very fully discussed; and innumerable observations have been made to determine the amount of ozone in the air. In the face of all this, it is somewhat of a shock to find that a chemist of the acknowledged eminence of Schoene should at this late day question the proofs which have hitherto been adduced for the purpose of demonstrating the presence of ozone in the air.

Nevertheless, Schoene feels himself warranted in making the assertion that "as yet we possess no chemical reaction by means of which we can prove the existence of ozone in the air." The proofs hitherto relied on for this purpose are substantially the following reactions: 1. Something in the air sets iodine free from potassium iodide and caustic potassa are formed. 2. Papers saturated with a solution of manganese sulphate are turned brown in consequence of the formation of manganese sesquioxide. 3. Thallium suboxide is oxidized to thallium oxide.

Bat Schoene's investigations have shown that these changes of potassium iodide and thallium suboxide can be as readily effected by hydrogen peroxide as by ozone; and hence that these reactions by no means prove the presence of ozone in the air. So also the change of manganese sulphate does not require the presence of ozone, as it is brought about by air free from ozone, in which a trace of carbonate of ammonia is present; and as this last-named substance is normally present in the air, the proof based on the change of the manganese sulphate papers loses its value. Other proofs that have been advanced are based on the supposed absence of hydrogen peroxide; but as this substance has been shown to be present in the air, they are worthless.

Schoene holds that the only reagent by means of which the existence of atmospheric ozone can be positively proved is metallic silver. But neither Schoene nor Houszau nor Andrews, to whom we are chiefly indebted for investigations respecting atmospheric ozone, have ever noticed a blackening of silver in normal air free from sulphur compounds; and Schoene reports that he has been unable to detect more than the slightest change in the color of silver-foil exposed for long periods to the action of the air.

Referring to the supposed formation of ozone during thunder-storms, Schoene asserts that the odor of the air noticeable under these circumstances is not that of ozone; and he farther questions the probability of the formation of ozone by lightning, since, as he urges, the electric spark in a mixture of oxygen and nitrogen causes the formation only of hyponitric acid, while the silent discharge is necessary for the formation of ozone.

It must not be inferred from the above array of objections, that Schoene denies that ozone may be present in the air. Such is not the case, his object being simply to show that at present we possess no valid proof.

**VOLCANIC THUNDER STORMS.**—A paper on volcanic thunder storms, by M. Faye, was read before the French Academy of Sciences on Nov. 2d. It is stated that in paroxysmal eruptions the enormous amount of steam ejected causes volcanic thunder storms, which are very different from ordinary thunder storms. The volcanic storm has no gyratory movement; it is confined to the column of ascending clouds, and no flashes occur without the presence of ashes. Altogether, the phenomena resemble very closely those of the Armstrong electric machine. As observers have failed to mention any hail attending these thunder storms, it is probably because no hail is formed. Its absence is due, M. Faye thinks, to the lack of gyratory motion already noticed.

**SHORT-SIGHTEDNESS.**—From the inquiries conducted by Prof. Hermann Cohn, of Breslau, since 1855, it appears that short-sightedness is rarely or never born with those subject to it, and is almost always the result of strains sustained by the eye during study in early youth. Myopia, as it is called, is seldom found among pupils of village schools, and its frequency increases in proportion to the demand made upon the eye, in higher schools and in colleges. A better construction of school-desks, an improved typography of text books, and a sufficient lighting of class-rooms, are the remedies proposed to avert this malady.

**A NOVEL BAROMETER.**—A very cheap weather glass is described by an old sportsman, that surpasses the most delicate barometers. In a corner of a room in his house he has carefully protected an epider's web. When the insect shortens the threads which suspend the web, rain and wind may be expected; if reefs be let out, fine weather is certain; if the spider remain inert, rain may be expected. The epider makes up its house every 24 hours; if this operation takes place in the evening, a fine night and a beautiful morrow may be prognosticated.

## The Genesis of the Ores of Iron.

Prof. J. S. Newberry, in the *School of Mines*, quarterly for November, 1880, says that iron ore deposits, including those of the Archæan, are shown by Dr. Newberry to be of sedimentary origin, and their formation through the aid of organic acids is sustained. Speaking of the Archæan iron ores, he says: "That in some cases the ore has been profoundly modified, both in character and position, since its deposition, is undeniable; but to be asked to believe that the ore sheets are intrusive is a greater strain upon my credulity than it can endure."

The magnetite and hematite ores in southern Utah, which Prof. Newberry was the first to describe, are situated 300 miles south of Salt Lake City, in what is really the prolongation of the Wahatch mountains. He observes that near Iron Springs, the so-called "Big Blow out" is a projecting mass of magnetite iron ore, measuring probably 1,000 ft. by 500, rising in castellated crags 100 ft. or more above its base. The Blair mine is a ragged black crest of magnetite, 200 to 300 ft. high. The ore of the region, which is half hematite, is in belts extending nearly vertical; it is often intersected by thin layers of quartz, or jasper, and occasionally by zones of crystals (two to three inches long) of apatite. The containing rock is granite, of a finer kind than that of the Wahatch axis; "some of the ore beds are interstratified with the granite, and are certainly, like it, metamorphosed sediments," as is well seen at the Blair mine. Prof. Newberry states that no eruptive iron ore exists in the Rocky mountains, and that in the opinion of Prof. Otto Torell, Director of the Geological Survey of Sweden, the ores of Sweden are metamorphic and not eruptive.

**THE KANSAS CITY REVIEW OF SCIENCE AND INDUSTRY.**—edited by T. S. Case, is a monthly "Record of progress in science, mechanic arts and literature," and aims to be "an exponent of Western thought and a means of communication of Western discoveries and theories." The December number contains the proceedings of the Kansas Academy of Science, and, in a briefer form, those of the St. Louis Academy of Science. It is published at Kansas City, Mo., in monthly numbers of 64 pages each.

**THE NOVEMBER METEORS.**—European observers of the November meteors, during the nights of Nov. 12-14th, think they obtained evidence of the increasing density of the Leonid-stream, thus confirming observations made last year in England and the United States. One of these meteors appeared larger than the planet Jupiter, with an intense blue light, and a bright train of the same color.

**THE PRISM DEVICE.**—Dr. Copeland, at Duanecht, while searching the heavens by the aid of Prof. Pickering's prism device, recently described in these columns, for introduction between the eye piece and objective of a telescope, discovered a small planetary nebula. Without this aid the discovery could not have been made.

**COPPER IN THE HUMAN SYSTEM.**—The normal occurrence of copper, in appreciable quantity, in the animal economy is well known. Quite recently, according to *Science*, Dr. W. Hadelich, of what place we are not informed, has detected and determined the presence of that metal in the soil of a church yard, and in portions of exhumed bodies.

**LUMINOUS GAS.**—Prof. E. Niedemann, in his investigation of the behavior of gases under the influence of electrical discharge, has arrived at a confirmation of a fact previously given by him. That a gas may be rendered luminous by electric discharges without any corresponding elevation of temperature.

**PROCEEDINGS OF THE ACADEMY OF SCIENCES OF PHILADELPHIA.**—For the convenience of those interested in mineralogy and geology, the papers of the proceedings of this academy in these departments for the years 1877-79, have been issued as a separate pamphlet, and made No. 1 of a proposed series.

**A PATENT HAS BEEN GRANTED FOR AN ELECTROMAGNETIC ROCK-DRILL.** A drilling tool is directly attached to the core of axial magnet and arranged to impart to said core a reciprocating motion. The current is shifted alternately to the coils.

**LONG DISTANCE TELEPHONES.**—It is stated that a company has been formed for long distance telephone service between New York and Albany, Saratoga, Buffalo, Port Jarvis and points in Connecticut, Massachusetts and Vermont.

**ALCOHOL AND ACETIC ACID,** says J. Bechamp, are constant and necessary products of putrefaction. He has discovered alcohol also in small quantities in normal and sound animal tissues.

**A FOSSIL BONANZA.**—Quite a bonanza in the shape of fossil pachydermata and carnivora has been found in the Thames valley, especially near Taplow.

**THE BLOOD IN A MOSQUITO.**—So slow is the digestion of the mosquito that when the insect has dined on a human being, it continues for 48 hours to exhibit human blood corpuscles.

**BIG PAPERS.**—The Sacramento Record-Union, San Francisco Chronicle and MINING AND SCIENTIFIC PRESS are each and severally deserving the highest praise for their big and really valuable holiday editions, and uniform excellence at all times.—*Ingo Independent.*

**THERE** is only one Humbug mining district, and that is in Arizona. But there are a good many humbug mining companies, and they are not by any means all in Arizona. You can only find them out by seeing a greater anxiety to sell stock than to work the mine.

## The Mining Share Market.

North Star, Bower and Munz mines, owned by Eastern capitalists, will now be energetically worked. The Greenwood seam belt promises, at no distant day, to be one of the most prosperous mining camps in the State.

#### MONO.

**MAY LUNDY BULLION.**—*Free Press*, Jan. 6: We saw a bar of May Lundy bullion Wednesday, and it was a beauty. Its weight was about 20 lbs, quite yellow in color, its value being about \$16 per ounce, or \$4,700 for the bar. The Lundyites swear that the May Lundy is the biggest mine in the world, and we believe that it will prove itself a big mine, if not the biggest, next year.

#### MENDOCINO.

**NEW GOLD MINES.**—*Dispatch*, Jan. 7: From present indications it will not be necessary much longer for the people of this section of the State to go elsewhere to seek wealth in mining operations. In addition to the gold mines at Hopland and Capella, a new field, rich in deposits of gold, has been discovered near this place. As evidence of the truth of this assertion, Mr. Robert Hildreth left at this office, on Wednesday, a small vial containing 21 small specks of the precious metal, the result of washing 1 pan of dirt. The mines just discovered are located 24 miles east of Ukiah, in the hills back of William Hildreth's place, and are said to be quite extensive. Black sand predominates in the formation in that section, and the gold is said to be in the sand. Scientific experiments made to demonstrate the value of this new field.

#### NEVADA.

**WYOMING MINE.**—*Nevada Transcript*, Jan. 4: By a slide of earth and stones from the great dump at the Wyoming company, the putting of a new one and causing some delay. In making the necessary repairs, precautions have been taken to provide against future accidents of the kind. Four more Frue concentrators have been put into the mill, making in all 8 of those useful machines in use there. The property is said to have very encouraging prospects.

**THE MOUNTAIN MILL.**—The building for the new mill of the Mountain Mill Co., on Deer creek, is being rapidly put up under the superintendence of Mr. Weisenburger and another gentleman whose name is not stated. The machinery will be put in and started in crushing as soon as practicable. The opinion prevails among mining men that with good management the Mountain mill will prove a successful enterprise.

**A FINE YIELD.**—*Herald*, Jan. 11: Eight tons of rock taken from A. C. Gillespie's mine, situated at Old Butte, had been crushed at Southern's mill, Grass Valley, and gave a total yield of \$425 or \$53 per ton.

**SCOTIA MINE.**—*Free Land*, Jan. 12: From present indications, we should say that the Scotia mine will soon be one of the dividend payers of this town. They have struck a ledge in the bottom of the shaft and all the rock looks well, while some of it is of extraordinary good quality, being filled with mineral and rich in free gold. Mr. Walter Stoddard, the superintendent, has pushed the work ahead as rapidly as possible, in order to take all possible advantage of the winter season, and they are now prepared to go ahead with the work in spite of any storms which may come. A station is being made at the 200 level, and when that is completed rock will be taken out for milling and the shaft will be sunk for the 300 level. Miners who are judges of ore inform us that they consider the prospect at the Scotia a most excellent one and can see no reason why it should not be a most valuable property. The rock assays well up in the hundreds.

**PEABODY MINE.**—*Grass Valley Union*, Jan. 12: The Oakland M. Co., which is working the Peabody quartz claim, on Rhode Island ravine, have been engaged for several weeks in re-opening the old drain tunnel to draw off the surface water which interfered with sinking the new shaft. This drain tunnel was badly caved by the rotting of the timbers, and it was almost like making a new tunnel. On last Friday night, when the drain was opened within 100 ft of the shaft, the water broke through, and for a time made things quite lively for the workmen. The water came in with such a sudden rush that all the lights were extinguished, and one of the men was washed through the tunnel a distance of 40 ft before he was able to get a hold upon the timbers and save himself. The men had a big scare for a while, but the water soon subsided. The water in the shaft, which previously had been under great pressure, was drained out, and the bottom, a depth between 40 and 50 ft, which enabled work to be resumed in sinking, and in a few days the shaft will be in firm ground, and the extraction of quartz will be commenced. The drain tunnel will carry off all the surface water, which heretofore has been a great obstacle in sinking the shaft.

#### PLACER.

**MINE TRANSFER.**—*Times*, Jan. 8: Mr. John P. Hickey, of San Francisco, and sole owner of all the Cedar Creek company's mines and ditches, has bought out the remaining interests in the Wisconsin mine, he having had several shares before. This claim has now passed into the hands of a man who will proceed to work it in conjunction with the Baker mine. Mr. Hickey has been in Dutch Flat for some days past, and is personally superintending the opening of work in the Baker, Dutch Flat canyon and the Gold Run claim. Mr. Hickey is one of the heaviest individual mine owners in this section.

**HUNT BY A BLAST.**—Tuesday of last week Phil. Bailey was seriously hurt in the Morgan mine, at Lowell Hill, by the discharge of a blast in the tunnel. He had set off a bomb, but after waiting some time he found that the fuse had not come out, went into the tunnel to relight it. When he had come up to examine the cause of the failure of the explosion of the blast, it went off. Most of the charge went into his face. He was badly burned about the face and it was thought both eyes would be lost, but we learn that one eye can be saved, with a possibility of preserving the sight of the other.

**BEAR DAM.**—*Herald*, Jan. 8: This last summer F. Birdsall, of the Bear River ditch, expended considerable money in putting in a dam and some undercurrents at a certain point on Bear river nearly opposite Colfax. A week ago yesterday some party or parties, as the report goes, went to the dam, drove the watchman away, and at once blew up the dam with giant powder. The damage, fortunately, was only nominal.

#### PLUMAS.

**GOLD STRIKE.**—*Greenville Bulletin*, Jan. 7: The Kerr tunnel prospects more favorably than ever. Twenty-four stamps are in constant operation, and all the work progresses favorably.

**PLUMAS NATIONAL.**—In consequence of the non arrival of the acids the new furnace of the Plumas National cannot start for a few days. There are now estimated at from \$30,000 to \$40,000 worth of sulphuric acid on hand, ready to be worked as soon as the acids arrive, which are now on the way from Reno.

**SOUTHERN EUREKA CON.**—The wood work on the new mill is all completed except laying the floor, which will be done as soon as all the machinery from the Greenville Iron works is in. In a short time will elapse ere the mill will be ready for active operation. The work on the lower tunnel is being pushed forward rapidly, and when the mill is ready the ore from this tunnel will be run on cars directly into the mill.

**GREEN MOUNTAIN.**—On the 1st instant this company shipped the finest single bar of gold bullion which ever went out of this mining district, valued at between \$12,000 and \$15,000, the result of a run of 13 days. The new mill is running splendidly, and as no delays are anticipated the run will doubtless be continued for the month. The new pipe across the McClellan ravine is now firmly anchored and the water successfully passing through. Should more water be required, and the ditch enlarged, the pipe will be amply sufficient, as it will carry 3 times the present capacity of the ditch.

#### SIERRA.

**KEYSTONS.**—*Mountain Messenger*, Jan. 8: Fifteen men are steadily employed at this mine. A large amount of rock has been taken out which will average at least \$15 per ton. It is expected that a clean-up of at least \$15,000 will be made in the spring. There is no perceptible decrease of the richness of the rock.

Very soft rock was struck Dec. 27th, by the Haskell Peak company, and the tunnel can be driven in it for about \$2.00 per ft.

**SUSPENDED.**—Work has been suspended on the Forest Queen ledge, but will be resumed in the spring.

**ENCOURAGING.**—The 1001 gravel company, above Sierra City, is steadily driving its main tunnel, and is now in better looking gravel than has ever been seen before in this section.

**BLACK GRAVEL.**—On Friday of last week the B. M. Extension mining company struck fine black gravel in their tunnel, at Forest City. Whether or not a channel has been struck, is a question to be determined by further exploration. So far as developed the gravel is of a deep blue color, carrying wallo quartz boulders well water-worn. Everything indicates a heavy wash. The tunnel is now in about 3,200 ft, and will be pushed forward as rapidly as possible. Gravel was first encountered in the upper left-hand corner of the tunnel, and gravel boulders were seen on that side in less than 20 ft, and the indications are that the whole tunnel will be clear of the rim rock in a short distance. The tunnel is running due north, and appears to strike through the rim at an angle of about 45°. The bedrock appears to pitch northwest at about the same angle. Some little time will necessarily elapse before the full significance of the discovery can be determined.

#### TRINITY.

**NEW RIVER ITEMS.**—*Cor. Trinity Journal*, Jan. 8: The long-looked-for rain has come at last, and mining is fairly begun for the season; water is plentiful and of course everybody is happy over it. There are about the same number of men on the river this year as last. The Slide Creek company is pushing their claim to Messrs. Buckley & White. The last named gentleman was the Superintendent last season, so I judge he knows the claim well, as he has certainly had every opportunity of knowing. The Portuguese company, on Big flat, began ground-sluicing last Tuesday. They are fairly prepared for a good season's work, having been improving the claim all summer—blasting bedrock, enlarging their reservoir, etc. The contractors on the New River hydraulic mining company are working in good shape. The saw mill has been running over a month, and a steam whistle may now be heard on New River. They have a very nice and smooth-running mill, provided with double circular saws, 50 and 40 inches diameter respectively, 1 edging and 1 cut-off saw. As everything is now in running shape, it looks almost impossible that all this heavy machinery has been packed on mules over 50 or 60 miles of such trails as we have, and as to making anyone but a mountaineer believe it, that is not to be thought of. The heaviest piece of casting in the mill weighed nearly 500 lbs, and was certainly a nice load for a mule; yet old Sacramento, the packer, succeeded in delivering it without accident. The mill is running night and day, and Mr. Jackson has plenty to do to supply the logs. The dam is a splendid and very substantial structure, likely to stand any freshet. It is 275 ft long on top, about 230 at the bottom, and backs the water over a mile up the river. The loggers are now a mile or more above the mill, as all the timber within that distance has already been cut down. The graders and ditch diggers have passed Bell's flat, 21 miles below the dam.

#### NEVADA.

##### WASHOE DISTRICT.

**CALIFORNIA.**—*Gold Hill News*, Jan. 16: During the week there have been extracted and sent to the mills 305 tons of ore, assaying \$31.58. On the 2300 level the joint Ophir east crosscut has been advanced 39 ft, and the joint Con. Virginia east crosscut has been extended 20 ft. On the 2500 level the south drift from the Ophir line has been advanced 40 ft, and the joint Ophir upraise has been extended 14 ft.

**CON. IMPERIAL.**—We have been engaged during the week in putting a brick bulkhead in the south drift from bottom of south winze, 2135 level. Shall hereafter have about 3 inches less water to pump, which is shut off by this bulkhead, and our expenses for pumping will thereby be largely reduced.

**SIERRA NEVADA.**—On the 2300 level the upraise has been advanced 20 ft during the week, the highest being 20 ft. On the 2500 level the west crosscut has been advanced 24 ft; total length, 94 ft. During the week 93 tons and 200 lbs of ore have been extracted.

**MEXICAN.**—On the 2500 level the joint Ophir east winze has been extended 9 ft, and the 2000 station set put in place.

**OVERMAN.**—East drift, 2275 level, has been extended 46 ft through very hard rock; total length of drift, 122 ft. We are now putting air-pipe in winze and will have the air-pipe up to the face of drift by to-morrow morning. Forman shaft has been sunk and timbered 20 ft; total depth, 1,635 ft.

**CHOLLAR.**—The drift south on the 2400 level was advanced 63 ft. The material through which the drift is made is clay, porphyry and some quartz. The formation being soft and quite loose, were compelled to timber quite thoroughly to prevent caving. The face of the drift, as well as the 63-ft run, are dry.

**YELLOW JACKET.**—During the past week we have placed a switch on the line of the Suro tunnel and extended the drift north 48 ft from the same. The ground has been very hard. In the shaft we have the usual force employed repairing and changing pit work.

**SILVER HILL.**—The winze on the 1300 level has been sunk and timbered 15 ft during the past week. No other work has been done at this level, as the water has not been lowered. The bottom of the winze is now near quartzite. Very little water is coming in below tank No. 2, but there is plenty above it.

**OPHIR.**—On the 2500 level the joint Mexican east winze has been sunk and timbered 9 ft, and the 2000 station set put in place. Also, on the 2500 level, the west crosscut has been extended 14 ft, and the joint California upraise 14 ft.

**NEW VIRGINIA.**—During the past week there have been extracted and sent to the mills 1,107 tons of ore of the assay value of \$35.53. On the 2300 level the south lateral drift has been advanced 32 ft, and the joint California east crosscut 20 ft. During the week \$33,544.96 in bullion have been shipped.

**UNION CON.**—On the 2500 level the joint Mexican upraise has been extended 20 ft; the joint Mexican west crosscut 14 ft; the joint Mexican east crosscut 20 ft; and the joint Sierra Nevada crosscut 48 ft.

**CALZONITA.**—Pumps have run an average of 16 hours per day, consuming 6 2/3 cords of wood per day. Forman shaft has been sunk and timbered 20 ft; total depth, 1,035 ft. The rock still continues hard in bottom. Water remains same as at last report.

**UTAH.**—During the past week the work in the mine has progressed as usual. The east drift, on the 1950 level, is 150 ft distant from the 1850 level. The east drift on the 2150 level has been advanced during the week 22 ft.

**BULLION.**—East drift, 2340 level, is in 300 ft, and still in vein material, through which stringers of quartz pitch west to the foot. The east drift, 2450 level, has just reached the casing of the vein.

**SAVAGE.**—During the past week the usual repairs to the shaft and the incline below the 2000 level, and to the 2100 station have been made, and the 10th level drift has been driven ahead.

**HALE & NORCROSS.**—On the 2400 level the north lateral drift has been extended 68 ft. During the week 74 tons of ore, giving an average assay of \$45.63 per ton, were hoisted from the 2100 level.

**UNION SHAFT.**—The shaft has been sunk and timbered 10 ft. Are repairing the drift at the 1600 level, cutting out bob-pit at the 2200 level and easing timbers at the 2400 level.

**G. & C. AND B. & B. SHAFT.**—Have been engaged the past week in taking out pumps and column above the Suro tunnel.

**C. N. S. SHAFT.**—Putting up the big engine which is to run the hydraulic pumps.

**O. & C. SHAFT.**—The 2500 station set has been placed in position.

#### ELLSWORTH DISTRICT.

**MOUNT VERNON MINE.**—*Grantsville Bonanza*, Jan. 8: Work will soon be resumed on this valuable property by

a Chicago company and the work of development pushed as vigorously as capital and muscle can send it along; the ledge in this mine is well defined and carries high grade ore, there will be no trouble, it is thought, to extract sufficient of it to keep a mill running steadily. Ellsworth has long been under a cloud, but the day is not far distant when the Mount Vernon and other mines of that district will be adding to the bullion product of the world.

#### GRANTSVILLE DISTRICT.

**THE CENTENNIAL.**—*Bonanza*, Jan. 8: This mine, as work progresses, is proving to be one of the very best in the camp. The ore in the new shaft is of a high grade and still increasing in width as they sink on it, with today a new strata coming into the main body. Work has also commenced on Centennial ground south and west from new shaft on what is proving to be an immense chimney, and if present prospects continue ore will be hauled to the mill in a few days which will more than pay their expense account.

**THE ALEXANDER.**—The ore in the lower levels of the Alexander continues to improve in richness and extent. We were shown a piece of sulphuret ore on Thursday that ought to mill at least \$100 per ton. The ore below the lower level is much richer than that above, and enough of it can be easily extracted to keep 100 stamps pounding steadily for years.

**THE BROOKLYN.**—Work is being pushed steadily in this mine and very fine ore is encountered in the lower level. Twenty stamps of the Alexander mill are kept pounding away steadily on Brooklyn ore and the mine never looked better than at present.

#### SECRET CANYON DISTRICT.

**GOON SHOWING.**—*Eureka Sentinel*, Jan. 8: Capt. Foley brings "glad news" from Secret Canyon. The snow over there is from 2 to 4 ft deep, but the majority of the miners are well supplied with provisions and mining materials, and the snow does not interfere with them. The Holden mine operators are doing "glad work," drifting for their ore body. They will be forced to run 50 or more ft yet to tap the same, if the calculations and surveys are correct, but the drifting now being done is in favorable ledge matter. The Irish Ambassador ore vein is widening with every stroke of the pick, and its owners feel pleased with the present prospects. Doc Hamilton and L. D. Pope are at work on the Page & Corwin. Supt. Potter, of Pinto, is doing assessment work on the series of mines which he purchased from John Herch. In fact everyone in the canyon is at work, and they feel encouraged with the recent developments. The best of all is that the Geddes & Bertrand is to be started up, mine and mill, next week.

#### SILVER CANYON DISTRICT.

**STARTED UP.**—*White Pine News*, Jan. 8: From Mr. Chapman, who runs a stage from Schellbourn to Silver Canyon, we learn that Dr. Brooks' mill, at the latter place, started up on the 1st. After half a day consumed in trying the machinery and helting, everything was found to run smoothly and satisfactorily. The ore now being worked assays from \$100 to \$130 per ton. Eighteen men are at work in the mine, and 12 at the mill. Dr. Brooks has a ledge 2 1/2 miles long, and 1/2 mile wide, from Brown to Centerville, 4 miles distant, which will be brought in in pipes next spring. Should this supply prove insufficient, more can be had in the same vicinity. Silver Canyon has 2 flourishing saloons, and 1 large general store, conducted by Pujade & Oaraghan, of Ward. The town, though in its infancy, promises to have a bright future. It is 26 miles south of Cherry Creek. The scarcity of lumber is one of the greatest drawbacks the people there have to contend with at present.

#### SUNNYSIDE DISTRICT.

**NEW DISCOVERIES.**—*Grantsville Bonanza*, Jan. 8: Some new discoveries have recently been made in this district, in mines owned by Tom Ferrel, J. Holden and Frank McPherson, and by the latter, promising results. The Albany they have a ledge 2 1/2 miles long, and 1/2 mile wide, from \$127.33 to \$157.08 per ton. The ore from the Northern Belle goes \$61.33, that from the Lucky Jim, \$115.35, and the Damsite, \$106.93. This ore was not selected but taken out promiscuously. This district is situated near Walker lake, about 3 miles from the Bellville road, and will be within 25 miles of the Carson and Colorado railroad when it is completed. The owners of these mines are satisfied that they have a good property and intend to push work on them.

#### ARIZONA.

**RACKENBACK.**—*Gazette*, Jan. 8: Mr. Perdue, one of the owners of the Rackenback mine, informed us Monday that the shaft on that mine is now down about 170 ft, in very rich ore. The ledge continues to hold out in size, and seemingly improves in richness, as depth is reached. The mortgage on the property of the Rowe mining company will, he informs us, probably be foreclosed at the next meeting of our District Court, as the company is failing to make any payments on the same. The Carpenter Creek South and other mines in the district are all looking well.

**HUMBOLDT.**—We learn that the Buena Vista, Silver Lamp and Washington mines, in Humboldt district, have been bonded by their owners, Messrs. Farley & Kee, to Mr. Weber, the Superintendent of the Tipton mine, and another gentleman, for \$30,000. The bondholders have the privilege of sinking, drifting and tunneling on the mine for 4 months, to inform themselves of the character and richness of the mine, and they have already set a number of men at work on them.

**UPPER TONTO MINES.**—*Globe Chronicle*, Jan. 2: The late heavy rains afford a chance of testing the value of the gold placer claims on Wild Rye. The creeks are booming, and almost every gulch has a running stream. The Olden Wonder (Nash's mine) is looking remarkably well, and is likely to give splendid results, the assays by whom it is now being worked. The Excursion has 3 ft of good ore (gold) in the bottom of the shaft. James Moore's ledge, near the Excursion, is 6 ft in width at a depth of 16 ft. The croppings assay rich in gold, and like all other gold claims in the district, it retains its richness in going down. Messrs. Oowan, Hill & Co. are prosecuting work on their water wheel at the East Verde, Mr. Smith is about to start his arastra on Wild Rye creek on gold ore from the Gulch. Messrs. House & House are prosecuting work in their main tunnel, in which they have lately struck silver ore of good quality. The late rich strike in the Hornet mine of the Mazatzal company is attracting the attention of mining operators.

#### COLORADO.

**SOLD.**—*Mining Reporter*, Jan. 7: The Gold Wonder, on Old hill, in the suburbs of Lake, discovered by young Fisher while out hunting a few months ago, has been sold through Mr. Copelin to C. C. Alvord for \$110,000, and \$50,000 in hard cash have been paid to Beam and Fisher. Manager Funk, of the George Washington and Wonder mines, awarded the Washington contract to Roger's Bros., who have commenced work on the 50 ft contract on main tunnel. They are industrious and efficient. C. C. Alvord, the purchaser of the Gold Wonder, will place a stamp mill near the mine, at the springs, the spring, and work will be prosecuted on the mine at once.

**SHERMAN.**—Work on the Rebel Boy is progressing rapidly. Barker & Hill have finished about 30 ft of their contract and still have 20 ft to complete. Tunnel is in 72 ft in all, and the vein is becoming stronger every day. They now have a pay streak of about 2 ft, which is every inch in brittle silver. Robinson & Wager commenced work on the extension of the Black Wonder mine yesterday morning. They have very strong vein carrying sulphurets and brittle silver in large quantities.

#### IDAHO.

**ATLANTA.**—*Cor. Statesman*, Jan. 7: The Tahoma mine, owned by Pedlar & Davis, is working from 6 to 8 men, taking out quartz and having it crushed at the Buffalo mill. The ore is the best mine in Idaho, and at present is looking better than ever. The Monarch is being worked under the superintendence of Mr. Wm. H. Pettit, who is working about 13 men. They are also taking out rock and having it bailed to the Buffalo mill for crushing. The Last Chance mine is being worked. The Moly mine, owned by George Tims & Co., is working 3

men. R. B. Brown is working 12 men. He has completed his new quartz mill and will soon be able to give it a test. Supt. Gault, at the Tahoma, is not doing anything this winter, but as soon as the spring will permit, he will erect his new mill and set men at work in the mine here. He has any amount of good ore in sight.

**ROCKY BAR.**—Rocky Bar is looking better now than it has for a long time; the times are very good and everybody has money to spend. There is some work being done in the mines at this place. The Ada Ellmore is being worked; running levels and sinking. They are working some 12 or 15 men. The Vishnu is being worked by Kever & Suttle; they are working some 6 or 7 men. The Alturas mine, formerly owned by Thomas Johnson, now belonging to Eastern men, will start up in a short time. They will probably give employment to 6 or 7 men. The Bonaparte is not doing anything this winter, but will, most likely, start up in the spring.

#### MONTANA.

**CABLE.**—*New Northwest*, Jan. 2: It is a satisfaction to know work is progressing very favorably on the famous lead recognized and referred to for many years as giving the best promise of any in Montana. But a dozen or more years ago litigation began concerning it; it became the cause celebre of the Deer Lodge Court; work was practically suspended; the mine filled with water; the expense of operating it properly appeared too heavy for our home capitalists to venture; Montana miners were in bad repute abroad and so the Atlantic cable held its golden store, and the two quartz mills dependent thereon stood in almost uninterrupted silence through many years. In 1875 Judge Hubbard, of Cedar Rapids, and Mr. J. C. Savery, one of the owners, were making a pleasure trip through Montana. An examination of the legal complications led them to believe that it properly assumed too heavy for our home capitalists to venture; Montana miners were in bad repute abroad and so the Atlantic cable held its golden store, and the two quartz mills dependent thereon stood in almost uninterrupted silence through many years. In 1875 Judge Hubbard, of Cedar Rapids, and Mr. J. C. Savery, one of the owners, were making a pleasure trip through Montana. ## Idaho Mining Districts.

The Virginia Enterprise has been permitted to make the following extracts from a letter to Dr. Delevan, of this city, from Dr. G. L. Lucas, dated Albion, Idaho, December 25th:

## Towns and Camps.

Bellevue is six miles above Emigrant crossing, on Big Wood river, and is the largest town on the river, but it has a rival in the newly laid out town of Heley, five or six miles up the stream, and opposite Croy's gulch. At this point Big Wood river is spanned by a new bridge, connecting the new town site with Mineral Hill district. At this point they are about to erect a smelter on the west bank of the river. The richest mineral in lower Wood river is within six miles of the place where the smelter will be erected.

About six miles northwest of Heley are the rich carbonate mines of Mineral Hill district. The chief of these is the Bullion. The vein is from 20 inches to 4 ft. in width, and the average value of the ore is \$200 per ton. The ore is 70% lead and 1% antimony, with a trace of arsenic. The gangue is hematite iron ore.

The Idahone, half a mile to the east of the Bullion, yields, clear of mining, sacking and hauling 175 miles to Kelton, thence by rail to Salt Lake City, \$100 per ton profit.

About six miles southwest of Heley are what are known as the Boyle mines—the Ohio, Ohio North, Trade Dollar, the Ornament, and many others. South from Boyle camp, Mr. Garrard and son, also F. Cammel, have a mine or mines of very rich ore. Mr. Garrard was private secretary to the late ex-Governor Bradley, of Nevada. Several mines at Boyle camp have changed hands at good figures, and much ore has been shipped out from that point.

There are rich mines at Croy's gulch, near Heley, as well as on Indian creek, say three or four miles east of Heley. A smelter is now at Kelton, Utah, waiting to be sent into or opposite Heley.

## On the East Fork

Of Big Wood river, end about half way between Heley and Ketchum, is the North Star mine, a large body of ore that does not assay so high as some, but what it lacks in quality it makes up in quantity. It was bonded in November for \$60,000, \$10,000 to be paid in 30 days, and \$50,000 in one year, the mine to be worked in the meantime, but the ore to be left on the dump until all the money is paid.

Ketchum is about 11 or 12 miles above Heley, on the east side of Big Wood river. About two end a half miles east of Ketchum, on Eagle creek, is the Elk Horn mine, for which \$12,000 was paid last summer. They have shipped to Salt Lake about 180 tons of ore that sold for \$130 to \$140 per ton.

## On Warm Spring Creek

The first discoveries were made by the Kelly brothers in May, 1879, as follows: West Fork, West Fork No. 2. It is a contact ledge with granite on one side and quartzite on the other. Both claims show from three to five ft. of galena ore averaging 100 oz. of silver to the ton. The Idaho, on Boyle mountains, assays from 60 to 300 oz. per ton.

The Erwin mine has the ledge exposed for 700 ft. by a series of shafts, open cuts and a tunnel. Ten and a half tons of ore shipped to Salt Lake from this mine sold for \$135 per ton, and there are 80 tons on the dump which will sample 130 oz.

The North Star, on Warm Spring creek, has shipped 10 tons and has 60 on the dump; Ontario has shipped 10 tons of first-class ore and has on the dump 300 tons of second class.

## Hot Springs.

Warm Spring creek rises near the head of the Smokey, runs east 25 miles through a dense forest of pine and fir timber and empties into Big Wood river, about half a mile above the town of Ketchum. About two miles up Warm Spring creek are what are known as Hot Springs. They are situated about 20 ft. above the bank of the creek. I took the temperature of five or six of the springs and found it to be about 162° Fahrenheit. There are about 150 inches of water when all is collected in one stream. Many are of the opinion that the springs are not only good for their medicinal virtues, but that they will also be of great use in connection with a smelter to keep water power from freezing in winter.

## Saw Tooth.

Galena City is about 25 to 28 miles above Ketchum, on the headwaters of the Big Wood river and on White Cloud, one of its tributaries. The mines, also at Saw Tooth, on the head of Salmon river and about 14 miles west of Galena City, are rich in free-milling ores—gold and silver. In and around Galena are the carbonate and galena ores of the richest character found anywhere on the Big Wood river. Wood is abundant, and plenty of water power is quite convenient. Timber for any and all purposes is plentiful, but grass is less abundant than at Ketchum, where 11 different kinds of grass grow wild, and as many kinds of timber trees, all good for the use of man.

Capitalists have made many fine investments in mines near Galena City and much work has been done, but I am not able to give names and particulars. A big smelter will be put up early next summer near Galena, and [at Saw Tooth one or more silver mills are soon to be erected. As they have mines very rich in free milling ores they will soon speak for themselves.

Work is progressing even now in winter at Saw Tooth and Galena. The miners are running tunnels, sinking shafts and the like. I am of the opinion that both Galena and Saw Tooth will be very lively camps next summer; probably more so than any of the mining camps on Big Wood river.

I am informed that 150 to 200 miners will find work at Saw Tooth mines, and 200 to 300 at Galena City next spring. Real prospecting will commence next spring on Big Wood river. Thus far only mines showing on the surface have been taken up, and I may say no deep cuts or tunnels have been run to search for blind ledges. The mineral belt is from 50 to 60 miles long and about half as many miles wide. There is an abundance of grass for stock, and neither oats nor barley is required during the spring and summer months.

## Prospecting.

Those who have been most successful in prospecting are men who made themselves acquainted with the kinds of country rock prevailing at points where rich ores had already been found, rather than go on knowledge previously acquired in California and Nevada. It is a noteworthy fact that the surroundings—quartz, quartzite, limestone, porphyry and granite—in which the ore is found differs very materially on the east and west sides of the Big Wood river. Most of the prospecting so far has been done on horseback, and many of the finds have been purely accidental.

## California Woolen Manufacture.

## The Golden Gate Woolen Mills.

The establishment of the Golden Gate Woolen mills marks an important era in the industrial progress of San Francisco. If the man who makes two blades of grass grow where one only was before springing up, so he, too, is deserving of consideration and esteem who utilizes raw products and by the inauguration of manufacturing enterprises adds to the wealth of the community. The Bulletin has the following article on the woolen manufacture of this city:

The manufacture of woolen goods was one of the first things in manufacturing attempted on this coast. Sagacious business men saw that while California was exporting largely the raw material and importing as extensively the manufactured article, the opportunity was afforded of utilizing the wool here and keeping at home large sums annually sent out of the country for woolsens of all descriptions. And from a comparatively humble start in San Francisco, there are to-day several woolen mills scattered up and down California, all finding a home market for the wool grower, and supplying employment in a greater or less degree to a large number of young people. The pioneer in this business was Donald McLennan, who has recently laid the foundation of what bids fair to be the most important enterprise of this character in the world, except the large woolen mills in the East and in Europe. But these manufacturing enterprises are not only valuable to a community as finding employment for the rising generation, and keeping at home large amounts that would be otherwise sent abroad, but they add greatly to the wealth and prosperity of the community in other ways. The owners of real estate are directly concerned in the establishment of manufactures. Every factory, however small and unpretentious, helps to make land more valuable in the city or town in which it is established. For this reason no person is more interested in making San Francisco the great manufacturing center of the Pacific coast than are those owning real estate within its limits. Every dollar invested in a local industry has a two-fold purpose. It not only brings back a return direct on the profits of the business, but it adds surely to the value of all the real estate in its immediate neighborhood. This is seen from the fact that communities frequently donate tracts of land for the location of factories, and the offers made to exempt from taxation enterprises of this character by municipalities. The people of Benicia recently gave a tract of land to a plow company, under the idea, of course, that it will pay them by drawing population, and so making the remainder of their property more valuable.

## The New Woolen Mill.

Those persons who are interested in making San Francisco the great manufacturing center of California, as well as the great commercial emporium, should visit the mill just erected by the Golden Gate Woolen Manufacturing Company, on Bryant avenue, between Nineteenth and Twentieth Sts. They will there see realized, being worked out in a quiet way, an earnest of the great manufacturing possibilities of this peninsula. The company, of which Mr. McLennan is President, has erected a substantial brick two-story building, 408 ft. long, with a width in proportion, specially adapted for a woolen mill. And the company is offering a practical illustration of how to build up an industrious community here. It is affording employment at this time to 127 white men, young women and boys, with all the appliances to double that number when the mill is running to its full capacity. It may be well here to interject a remark to dispel any illusion as to the best location for a woolen mill in California. It is a great mistake to suppose that the best place for a woolen mill would be, say in the foothills on the east side of the San Joaquin valley, because there are the large runs of the principal wool growers. In the manufacture of woolen goods all kinds of wools are necessary.

Oregon and California wools are mixed for ordinary material.

The Stockton woolen mill purchases all the wool it uses for manufacturing, not at that point, but in San Francisco. Thus the raw wool utilized in Stockton has to bear the cost of transportation to this city, and then the manufactured goods bear the expense of carriage again to San Francisco, for a market. The same remarks apply in a measure to the woolen mills of Marysville, Sacramento, San Jose, Merced and Los Angeles. Most of the blankets, etc., there made are sent to the wholesale houses of this city to be distributed to the retailers. Thus it will be seen that the peninsula of San Francisco is the most eligible point on the Pacific coast for manufacturing, because what is true of a woolen mill applies with equal force to other industries. So that if our local government can be kept from taxing manufacturing property at higher rates than it has to pay elsewhere, the advantages of this point would be immensely greater than any other in the State.

## A Perfect Manufacturing Establishment.

The experience of Mr. McLennan has enabled him to plan and secure in his new mill the most perfect appliances and recent inventions in this branch of industry. The mill can turn out the finest cassimeres, or the most substantial blankets. Just now it is running on a government contract for kerseys. The mill stands on a block of land 408 ft. in length by 200 in width. There is upon the premises an artesian well yielding a supply of water large enough for two such mills. Let us hope the Supervisors will not succeed in fastening a water tax upon this well. The presence of this artesian well ought to go far to secure the success of the enterprise, as the Pioneer mills—a rival institution which has just commenced suit against Auditor Dunn to compel the auditing of the Spring Valley Water company's bills under the Bayly ordinance—claims to be paying \$600 per month for water. Such a well as the Golden Gate mills have does not involve the total expenditure, probably, of more than \$1,000, and water can be pumped by steam power to an elevation of 60 ft. at an expense of only half a cent per thousand gallons. The dyeing department is complete, the vats large, and this branch is under the direction of two experienced wool dyers, who have been brought here from Europe. There is everything in the factory to transform the fleece, as it leaves the sheep's back, into the finest cloth. It is not in the province of a newspaper article to describe minutely the process of woolen manufacture, but any one so disposed can profitably employ a couple of hours at the mills in watching the manifold processes of washing, carding, spinning, weaving, hurling, gigging, etc., before the cloth is finally pressed and delivered. The facilities for washing and dyeing are all that can be desired. The mixing picks is a Sergeant's patent capable of making 800 revolutions a minute. There are six sets of carding machines, Davis & Furber's patent, manufactured at Andover, Massachusetts. These carders can be run equal to nine sets or 2,128 spindles. From the cards the yarn is sent to the spinning machines. These also are of Davis & Furber's patent and are set low so as to be run by boys. The weaving is performed by women on broad Compton looms, of the newest patent. Of these the mill now has 30, with appliances for increasing the number. There are three sets of gigging machines, six sets of fulling mills, the whole machinery being driven by an elegant engine and hoilers of 120-horse power, manufactured by Prescott, Scott & Co., of this city.

## The Capacity of the Mill.

The mill has now capacity for turning out about \$400,000 worth of goods annually, but it could be easily increased to \$600,000. The market for the goods is practically unlimited. The mills now running on this coast do not supply one-fifth part of the woolen goods consumed. There is such a hard field in this class of merchandise in the variety of products, all manufactured from wool, that there is no danger of the mill not being profitably employed. It will take some time yet before the home consumption for cassimeres, kerseys, flannels, tweeds and blankets can be supplied. The great necessity for California to-day is the establishment of manufacturing enterprises. The agriculturist is as directly interested in this matter as the merchant or artisan. If there was a larger home consumption of wheat the farmers of the Sacramento and San Joaquin valleys would not be watching the harvests of other countries with such intense anxiety as they do at present. California has passed through the mining era and we have now arrived at the time when agriculture is possibly the leading industrial pursuit. The State is just entering upon the manufacturing epoch. And political economists who have been watching our progress here predict that the manufacturing will ultimately supplant the other two in aggregate wealth. It is certain that for the building up a prosperous commonwealth we must have the manufacturing element. Such institutions as woolen mills offer the most satisfactory solution of the hoodlum problem. At this time, also, industrial enterprises appear to promise the best interest on investment. There is nothing of speculation in them. They are legitimate outlets for surplus capital. When they are well managed there is a tolerable guarantee of immediate returns. San Francisco must ever be the main distributing point for the whole Pacific coast. In that regard it offers the most advantageous site for a manufacturing enterprise.

## Salt in California.

The discovery of salt springs in California may lead to important industries connected with the production and consumption of that very useful mineral. While the State Mineralogist was examining the limestone and marble deposits in Placer county, he was informed of two springs, the waters of which were salt, and although they had been known for many years, no special importance had been attached to them. The information was given too late to admit of one being examined, situated in section 30, township 13 north, and range 9 east, but a sample was obtained from the other—north-west quarter of section 15, township 13 north, and range 8 east, Mount Diablo meridian, an analysis of which, made in the laboratory of the State Mining Bureau, has proved very interesting.

The water is strongly calcareous. It is filled with mechanical impurity, and has a distinct saline taste. A drop evaporated on a glass slide, under the microscope shows an abundance of characteristic hopper-shaped crystals of salt. An analysis was made from the filtered water, and the amount of salt contained was found to be 1143.6 parts in 100,000. The full analysis is not given here for the reason that the water was taken from the spring without special care, and can hardly be supposed to be a fair sample. The localities mentioned will be carefully studied, and the results published in full.

It is highly probable that a well sunk at this locality would develop a valuable supply of brine—at all events it is worthy of the experiment. The strength of the water as shown by analysis, falls far short of that of deep salt wells sunk artificially. But this might be expected, as in its passage upward from an unknown depth, it would be likely to become diluted with fresh surface water. The profitable production of salt from this source is a question of labor, fuel and transportation. If a brine can be found, by sinking, that may be crystallized and delivered at a market with profit, the work will be continued, otherwise one of two things will follow: either greater economy will be studied and practiced, both in fuel and labor, or the work will be abandoned, to be resumed when conditions are more favorable. Salt is already manufactured in the State, generally from sea water, and it may be that at the present time this new source cannot compete with the old; yet in New York, which also has a sea coast, the salt wells of the interior counties have been worked with profit for many years, and will, no doubt, continue to be for many to come.

The following figures, from the geological surveys of that State, will show the importance of this industry: At the Onondaga salt works alone, the quantity of salt inspected in 16 years, from 1826 to 1841, inclusive, was 30,127,837 bushels. In 1862 the salt production of the State was 9,063,947 bushels, and the annual average since that date is estimated at 8,000,000 bushels. The State claims all the salines and leases them, collecting a royalty of one cent on each bushel of salt produced. A State Inspector is appointed, whose duty it is to report the product and to stamp on the packages the quality.

Extensive salt works are in operation in West Virginia, Kentucky, Michigan, Indiana, Missouri, Pennsylvania, and other States. In Michigan, attempts made to utilize the salt springs were at first unsuccessful; so important, however, was the matter considered, that the Legislature offered a premium of ten cents per bushel on all salt produced in the State. Michigan is now second only to New York in the production of salt.

There are three different methods of manufacture, as practiced in New York and other salt-producing States: First, boiling in kettles; second, solar evaporation; and third, evaporation in shallow pans by artificial heat. In the first method the kettles are of iron of a capacity of 100 gallons, set in brickwork in such a manner that one furnace supplies heat to a number. The kettles are filled with brine, which is kept in a state of violent ebullition. Lime salts first form, which are removed from time to time with suitable ladles, and the operation continued until the resulting salt is nearly dry, when it is removed, drained from the mother liquor, and fully dried. Solar evaporation is effected in shallow wooden vats, built in pairs, one on a higher level than the other. The brine is conducted from the wells to the upper set through wooden pipes, where it remains exposed to the heat of the sun until some of the foreign matters fall, when it is drawn off into the lower set in which the salt, now comparatively pure crystallizes out. By the third method the brines are evaporated in shallow iron pans, heated either by an open fire or by steam coils.

There are many ways of economizing in the manufacture of salt, the result of the experience of those engaged in its manufacture, in our own country and elsewhere, which would not immediately occur to those new in the business, such as pumping brines by windmills, and partly condensing by the action of a current of air, by which method the brines are pumped to a certain level and caused to fall in showers on faggots of small branches, by which the liquid is broken and divided in contact with the air, becoming rapidly and economically concentrated.

Salt wells are very stable in their nature. One in New York has been pumped for more than 40 years without the strength of the brines decreasing.

## Main Range Mines, Montana.

About midsummer last, great excitement was caused in Butte by the reported discovery on the summit of the main range of the Rocky mountains, several miles east of this city, of numerous and fabulously rich quartz leads which were said to be cropping out all over the country. As a natural consequence, many prospectors stampeded to the scene of excitement. The country, over a small area, was well prospected and quite a number of claims were staked out. Whether the majority of them are good, bad or indifferent, is yet to be ascertained, or, may never be ascertained, as very little development has so far been prosecuted. On three of the properties, however, considerable money has been expended and the results are very encouraging. Of these the Fourth of July is attracting the most attention. It was discovered on the Fourth of July by Budd and Lilja brothers. The prospect is located in a ravine leading into Park canyon, being very near the summit of the Main range and four miles from Butte. It is developed by a shaft 30 ft. deep, from which an east level has been extended on the vein to allow of the extraction of the very rich ore which is found near the surface. The quantity of ore produced from the Fourth of July is not large, but the quality has made up for the limited tonnage. Of first-class ore, averaging 340 ounces per ton and one ounce of gold, 24 tons have been produced, and of second-class ore, averaging 81 ounces and \$5.39 in gold, 30 tons have been produced. The Fourth of July ore is base in character and was worked at the Colorado smelter.

The Major Budd is located a short distance from the Fourth of July, and is owned by the same parties as the latter. It is developed by a shaft which is not yet deep enough to test the permanence of the vein. The ore in the bottom samples from 50 to 300 ounces silver, and quite a number of assays running up into the thousands have been made. A tunnel several hundred ft. long is being driven to tap the vein and, though the rock is somewhat hard, excellent progress is being made. About 12 tons of first-class ore and a large amount of an inferior grade are on the dump. It will all be shipped to the smelting works of the Colorado and Montana Co. for reduction.

The Fifth of July is another prospect owned by the same company, but aside from a little surface scratching which uncovered a promising looking ledge as far as explored, nothing has been discovered worthy of note. The gentlemen are to be congratulated on the possession of several very promising prospects, and one, the Fourth of July, would rank as a valuable property in any country. It is understood that a one-fourth interest was recently sold for \$10,000, from which fact some idea may be gained of its probable worth.

## Carson and Colorado Railroad.

The Virginia Enterprise says: Three ships—the *Western Belle*, the *Ennerdale* and the *Forfarshire*—have arrived at San Francisco with steel rails for the Carson and Colorado railroad. The rails will be brought up here as rapidly as possible. These rails are sufficient to lay the track to the point beyond Hawthorn where it will connect with the wagon road to Bodie. There are on hand ties sufficient to lay the track the full distance.

If the weather holds good track will be laid at the rate of a mile and a half per day. The track can and will be laid at this rate of speed.

The flat cars are all in from New York and the box cars are arriving. The passenger cars are now lying finished at Dayton, Ohio, at Varney & Smith's manufactory, and will be here in February. The Baltimore Locomotive Works will ship two more locomotives on the 1st of January.

The road is being pushed ahead as rapidly as possible, and it will be continued beyond Candelaria to the Gold Mountain mining region. Eventually it will be carried through to Colorado, at which point it will connect with some road running to or through that country. When completed the Carson and Colorado road will be not less than 500 miles in length. In its course it will tap and pass through the most promising mining and mineral regions in eastern Nevada. Not only will it pass through and near to mines of gold, silver, copper, lead, iron, antimony and the like, but will also tap a country in which are large fields of salt, soda, borax, alum, sulphur and many other very valuable mineral treasures, as chromate of iron, ochers and earths of various kinds and colors, not a few of which are likely to prove useful as fire-proof and other paints. Marble, gypsum, alabaster, jasper and other kinds of stone for various purposes are also found in the regions which the road will traverse.

**TRADE-MARK LAW.**—It is a rule in the law of trade-marks that the use of any name or symbol as a trade-mark must be new to make an exclusive right to use it as such. If the term has never before been used as applicable to a like article, it cannot be exclusively appropriated. It is also a rule of that law that if the article is known to commerce in general by the term claimed as a trade-mark, the claim is ill-founded. It is also a rule that if the term employed indicates the nature, kind or quality of the article, instead of showing the origin of it, an exclusive right to the use of the term may not be maintained.—*New York Court of Appeals.*

## Useful Information.

## The Glue Pot.

That indispensable and of all others the most important article to every well-regulated factory and cabinet shop, as well as many other kindred branches of trade. How common is it for the young artisan or apprentice to fall into the error of thinking that glue is king-cure-all, regardless of the application! In the first place, the article used should, by all means, be a good one, of which we presume every practical mechanic is a judge. It should then be dissolved in a proper manner and to the proper consistency or body, according to the work to which the application is to be made. Now comes the point at which there is the great majority of the failures; and the difficulty is not so much with the glue or application as it is in the preparation for the same. In other words, be sure that you are ready by having tried the work together, before you take the glue brush in hand. And if the work is mortise and tenon, you have made a failure that is not easily remedied if you have made the tenon too small either in thickness or width to fill perfectly the space in the mortise. To guard against this error, know what you are doing.

When you are cutting the mortise and tenon let it be either by hand or machinery; and when the glue brush is taken in hand, these general rules should always be observed, no matter what the character of the work. See that the temperature of the room is warm. If in cool weather, use artificial heat to bring the thermometer to 70° or 80°, if you can conveniently do so. But this depends entirely on the nature of the work. As to how much time must of necessity be consumed between the first spread or application and the final set, that time should always be brought down to the shortest period, if the nature of the work is such that it must of necessity take time to get the work together.

The great objection of chilled glue should be avoided by getting the wood to be glued first warmed and having your glue boiling hot. Dissolved glue contains a large percentage of water. The glue joint dries by the wood absorbing the water from the glue, and hence must of necessity expand the fibers of the wood coming in close contact with it, and if dressed off in this expanded condition, that part must dry out, although it takes time to do it, as the moisture cannot escape except through the pores of the wood. And upon the same receiving a high polish in the finishing room, you will see a sunken place 20 ft. off right over the tenons that were dressed off in the wet or uncontracted state. This same rule is applicable to joints in the edges of boards that are glued together. The tongue and groove joint becomes more expanded than the square joint, and hence takes longer to dry out, from the simple fact that it takes in more glue.—*Cabinetmaker.*

**GARLIC IN WHEAT—THE TROUBLE AND HOW TO REMEDY IT.**—The *United States Miller* says of this troublesome plant: It has a head somewhat like a seed onion and containing seeds about the size of a wheat grain and only a trifle lighter. This seed contains a glutinous material which, in grinding, gums up the pores of the burrs, necessitating frequent scrubbing of the stone faces. The best dress for grinding garlicky wheat is obtained by cracking them roughly all over the face and dressing them quite open about the eye. Separation of the garlic from the wheat is very difficult, by reason of the similarity in the size and weight of wheat and garlic grains. To manufacture garlicky wheat, it must be cleaned several times, then chopped or half ground. This will break the garlic, which is somewhat softer than the wheat, and allow its gum to diffuse itself through the meal, so as not to close the stones very much in the second grinding. It is better if the chopped grain be allowed to lie a considerable time before second grinding, that the garlic may dry.

**A NEW GAME.**—Mr. J. Banting Rogers has devised and published a game which is likely to be of service not only as a really interesting amusement, but also as a means of acquiring a considerable knowledge of navigation and meteorology. It is entitled the game of a "Voyage Round the World," and is played on a large board representing the ocean, suitably divided for counting by knots, and with bazards in the shape of cyclones, collisions, etc., which add excitement to the game. The game is played by means of a number of small models of ships of various kinds, and cards in which the number of knots is marked within which the players may move. Logs are kept, watches appointed and a captain of the watch to record distances, etc. Altogether it will be seen that in Mr. Rogers' ingeniously devised game there are great possibilities both of amusement and instruction.

**ASBESTOS POWDER.**—Asbestos powder, made into a thick paste with liquid silicate of soda, is used with great advantage for making joints, fitting tape and connecting pipes, filling pipes, etc. It hardens very quickly, stands any heat, and is steam-tight.

**LIME IN THE SEA.**—Every square mile of the sea contains from two and a half to three tons of limestone.

**THE MINNEAPOLIS FLOUR MILLS.**—Gen. C. C. Washburn, who recently visited Minneapolis, says that the mills of that place will grind 22,000,000 bushels of hard spring wheat during the year 1881. Minneapolis millers are now universally using roller mills. Eastern mills can no longer compete with Minnesota mills, for the reason that they cannot obtain the proper quality of wheat. All the hard wheat which reaches Chicago is mixed with soft to grade it up, and consequently millers there or east of there cannot get the same quality of wheat, all alike in its nature to make the best grades of what is known to the trade as patent flour. Minneapolis flour can be delivered in Great Britain for \$1.20 per barrel above its cost in Minneapolis. Minneapolis millers are taking steps to improve their transportation facilities, so as to transport their produce in as direct and short a line as possible, and as soon as the arrangements are perfected, but little flour will go East by way of Chicago.

**INFLUENCE OF ELECTRICITY ON VEGETATION.**—In hamboos the flow of sap takes place at the beginning of the rainy season, but vigorous shoots rarely grow before the thunder storms, which generally precede the harvest. The rapidity of their growth increases with the violence of the storms, amounting sometimes to as much as 70 ft. in 30 days, the vegetation being most active during the night. Capt. Sieman suggests that the cause of this sudden growth may be the increase in the quantity of nitrogenous compounds, which are greedily absorbed by the humus that surround the roots of the hamboo. The facts offer a curious confirmation of the experiments of Dr. Sieman upon the influence of electricity on vegetation.—*Les Mondes.*

**SHOE-HEELS OF COCONUT FIBER.**—The outside fiber of the coconut is now used in England in forming shoe-heels. The product is said to be one of the best substitutes for leather thus far devised for the purpose. The disintegrated fiber is stamped into form under a heavy pressure, apparently after being mixed with some cementing liquor.

**TO INFLATE SMALL BALLOONS.**—Gas for inflating small balloons may be made by placing a quantity of zinc scraps in a bottle, pour over them a mixture of sulphuric acid and water, and hydrogen gas will be rapidly evolved. Convey this gas through a wash-bottle to your balloon. This experiment should not be performed in the vicinity of a light or fire.

## Good Health.

## Temporary Deafness.

According to Dr. H. Augustus Wilson, a very common cause of deafness is the hardening of wax in the ear and the unscientific plan that people adopt for its removal. They generally succeed in making a bad matter worse. The ear is not so exquisitely sensitive to the presence of foreign matter as the eye, and hence those who work at the ear with hairpins and toothpicks are likely to injure themselves irreparably. Only the softest materials and the gentlest pressure should be used in cleaning the ear. In a recent clinical lecture, Dr. Wilson gave, in popular form, some very useful and practical information touching the removal of ear wax. If the ticking of a watch can be heard at a distance of 25 inches the hearing is good. Each ear should be tested by the watch separately. Noise in the head, sometimes ringing, frequently are due to hardened wax in the ear. Sudden deafness is sometimes caused as follows: A small mass of wax, from ill-health or uncleanness, becomes hard. A continued secretion of wax then blocks up the ear tube still more. An injudicious attempt is then made to remove the wax by introducing, perhaps, a match end, a pin bead, or a pen holder, which instead of removing pushes down the wax and packs it against the tympanum; or by a sudden draught or the act of swallowing the wax is suddenly pressed upon the membrane, and loss of hearing immediately ensues, because the membrane can no longer vibrate. The removal of the wax is in some cases, especially those of long standing, somewhat difficult; but with gentle treatment and patience may finally be accomplished and the hearing fully restored. The best ordinary means for removing wax, when not badly compacted, are half a drachm of sodium carbonate dissolved in an ounce of water, applied lightly, by means of a bit of absorbent cotton or sponge attached to a suitable handle. When the wax is much compacted it may be softened by means of water, quite warm, and a syringe.—*Sci. Am.*

**EFFECTS OF ELECTRIC LIGHT.**—It is said that if a person of fair complexion exposes himself to the electric light for some time in examining the action of lamps, the hands and cheeks will show all the symptoms of "sunburn," even in midwinter, and he will develop freckles on his countenance as quickly as when he goes about unprotected by a sun umbrella in midsummer.

**SEA SICKNESS.**—Mr. F. W. Cory, in the *Lancet*, states that the best remedy he has found for sea sickness is a combination of small doses of bromide of potassium and hydrate of chloral taken with citrate of magnesia during effervescence.

## A Poisonous Fly Bite.

John Story, a warehouse laborer in New York, recently died of malignant pustule caused by the bite of an insect which looked like a fly.

Story was at work in a tobacco warehouse, and, while handling a bale of Havana tobacco, he felt a sharp pain in the left side of his neck. Instantly he clapped his hand on the spot, and a winged insect, which he took to be a gnat, flew away.

The pain was but temporary, and he paid no attention to it until the following day, when an inflamed pimple had formed on the spot where he had been bitten. This pimple annoyed him considerably, and he tore it open.

The next day the spot was very much inflamed, the inflammation extended in a circle as large as a silver quarter about the wound. The circle quickly enlarged, the inflammation increased, and Story became frightened and called in a physician, who recognized the wound as a malignant pustule, which would undoubtedly prove fatal.

The skin about the wound burst, and the inflammation extended along the neck toward the head, and the lower portion of Story's face was swelled to twice its natural size. Symptoms of blood-poisoning showed themselves, and the patient lingered in great agony for two or three days, when death ended his sufferings.

**A CUP OF TEA.**—In a recent lecture by Mr. G. R. Tweedle, F. C. S., London, on "A Cup of Tea," the speaker divided the subject into four sections—the tea, the water, the milk and the sugar. The lecturer first drew attention to tea drinking with every-day life, and showed that the principal components of tea were theine and the essential oil of tannin, which latter possessed astringent properties. He informed the audience that the best time to take tea was about three hours after dinner or any other heavy meal, and deprecated in the strongest terms the excess to which tea drinking is carried by some people, asserting that such a practice induced a nervous disorganization and impeded digestion. He showed that the sole difference between black and green tea was one of preparation, and that both kinds could be obtained from the leaves of the same plant. After asserting that the adulteration of tea had very much decreased of late years, which the tea-drinking public will be glad to know, the lecturer proceeded to treat of the various kinds of shrubs grown in different parts of the world and the countries where the different kinds of teas were consumed, the lecturer came to the consideration of the milk, its value as a nutritive agent, and referring to its adulteration he made the astounding assertion that in London alone every year no less than £70,000 was spent on water which was used for milk. Passing on to regard the sugar, the lecturer denied the common error that sugar was injurious to the teeth, bringing forward as an example the negroes of Jamaica, who, he said, though they were the greatest eaters of sugar in the world, were proverbial for their beautiful teeth.

**AN IMPROVED GLUE DRESSING FOR WOUNDS.** Cabinet makers and wood workers generally are familiar with the uses of glue in dressing tool cuts and other slight wounds incident to their calling. The glue pot is always handy in their shops, and a glued rag answers as well as the best adhesive plaster. In a recent paper before the Philadelphia Academy of Surgery, Dr. Hewson recommends the addition of acetic acid to the glue, and a little attar of roses to cover the odor of the glue and the acid. This compound spread on paper or muslin makes, he says, a good substitute for adhesive plaster for surgical use. It is easily and quickly prepared, simply by putting into a vessel of boiling water, a bottle containing one part of glue to four, by measure, of the acid, and letting the bottle remain in this bath until the glue is fully dissolved and mixed with the acid. Common glue may be used and official acetic acid, to be had at any drug store. The mixture should be kept in a wide-mouthed bottle, well stoppered by a long cork, which can always be removed by heating the neck of the bottle. Care should be taken to keep the mouth of the bottle clean by wiping it well with a cloth dipped in hot water. A bottle of this cheap and easily prepared dressing would be a good thing to have at home as well as at a workshop.

**A SPINAL ROOT OF THE OPTIC NERVE.**—Stilling, of Strasburg, showed preparations to the International Ophthalmological Congress at Mailand, in September last, which he believes demonstrate the existence of a spinal root of the optic nerve, which brings the retina into direct connection with the medulla. This root passes from the external corpus geniculatum, in a winding course, deep between the bundles of the crus cerebri, and can be traced into the pons; and it appears to course down in the direction of the medulla, although its further progress cannot be demonstrated. The existence of this branch is interesting on account of the light it throws on certain physiological relations between the medulla and the retina, and may constitute the hitherto undiscovered link between certain diseases of the spinal cord and of the optic nerve.

**COFFEE FUMES.**—In some recent experiments at Paris the fumes of burning coffee were shown to have a disinfecting power quite remarkable.

#### TABLE OF CONTENTS.

GENERAL EDITORIALS.—Magnetic Separation of Ores; A Self-Leveling Ship's Berth, 33. The Week; Metallurgical Centers; Fire on the Comstock; Water Rights, 40. Physical Studies of Lake Tahoe.—No. 3, 40-1. Our New Senator; Legislators; A New Coal Supply, 41. Notices of Recent Patents, 44.

ILLUSTRATIONS.—Edison's Magnetic Ore Separator; Hueston's Patent Ship's Berth, 33. Gen. John F. Miller.—U. S. Senator from California, 41.

CORRESPONDENCE.—Amador County Mines, 34. MECHANICAL PROGRESS.—The Reuss Fusing Dish; Annealing Steel; A New Electric Motor; Puddling of Iron; External Corrosion of Boilers, 35.

SCIENTIFIC PROGRESS.—Atmospheric Ozone; Volcanic Thunder Storms; Short-Sightedness; A Novel Barometer; The Osmosis of the Ores of Iron; The November Meteors; The Prism Device; Copper in the Human System; Luminous Gas; Proceedings of the Academy of Sciences of Philadelphia; Long Distances Telephones; A Fossil Bonanza, 35.

MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Notices of Assessments, Meetings and Dividends, 36.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Idaho, Monticola, New Mexico and Utah, 36-7.

USEFUL INFORMATION.—The Glue Pot; Garlic in Wheat; A New Game; The Minneapolis Flour Mills; Influences of Electricity on Vegetation; To Inflate Small Balloons, 39.

GOOD HEALTH.—Temporary Deafness; Effects of Electric Light; Sea-Sickness; A Poisonous Fly Bite; A Cup of Tea; An Improved Glue Dressing for Wounds; A Spinal Root of the Optic Nerve, 39.

MISCELLANEOUS.—Legislative Committee: Out on Rock Creek; The Claims in the Comstock Lode; Togo District, 34. Idaho Mining Districts; California Woolen Manufacturers; Salt in California, 39. Main Range Mines, Montana; Carson and Colorado Railroad; Trademark Law, 39. Deep Mining in Bodie; Nevada County Mines; The Old Mining Records; Mining Locations, 42.

NEWS IN BRIEF, on pages 44 and other pages.

#### Business Announcements.

Baldwin Locomotives.—Williams, Dimond & Co., S. F.  
Gardner Governor.—Berry & Place, S. F.  
Dividend Notice.—Western M. Co.  
Assessment.—Blus Bird M. & M. Co.  
Dividend Notice.—Northem Belle M. & M. Co.

#### The Week.

The principal event of the week in mining circles has been the most unfortunate fire on the Comstock, by which the Hale & Norcross hoisting works were burned. This disaster is referred to in another column. If the big engine is damaged beyond repair, the whole loss by the fire will be over half a million of dollars. The Comstock has been particularly unfortunate of late.

The Legislature, in session at Sacramento, has got down to work, but so far has enacted nothing of special interest to the mining or manufacturing industries.

Reports from the mines this week are pretty full and are very encouraging.

The election of our United States Senator is also an event to be chronicled. Gen. John F. Miller, the new Senator, is a man of large experience, liberal ideas and good practical judgment. He has a full knowledge of the needs of California, and being a man of fine education and oratorical talent, will not lack the means of setting them forth.

A SOARED MULE.—Employees of the Streator (Ill.) Coal Co. attempted to lower a fresh mule into the mines. When the cage started down the animal was overcome with terror, and when they went to take him from the cage they found he had died of fright while descending.

IDAHO, as a mining section, is beginning to attract the attention of capitalists and prospectors at a distance, and next season will see a greater influx of people in the Territory than at any time since the early days of our placer excitement.

THE new Oxford University hoathouse, with many valuable boats, is burned.

#### Metallurgical Centers.

For a number of months past, there have been rumors of projects looking to the utilization of the low-grade ores of the Comstock, as well as those of numerous other metalliferous veins within a radius of 50 miles. One of the latest of these rumors is to the effect that a prominent mining man in Virginia City is causing the dismissal of hundreds of working miners, with the view of breaking up the organization of the Miners' Union in that city, as a preliminary step toward such a reduction of miners' wages as is looked upon as necessary to the profitable extraction of the millions of tons of low-grade ore said to exist in the upper levels of the various mines on the Comstock. This reduction, heretofore proposed as applicable only to the men employed in those upper levels, has been resisted by the Union, from the fear that it may be only the entering wedge of a universal diminution of the wages of labor in that section. Whatever truth there may be in this and other reports, it appears highly probable that unless some reduction of expenses is in some way made, the further working of the Comstock mines must soon be relegated to another generation. If this is true, the question is simply whether it is better that the large number of men now employed on and about the Comstock lode, shall be compelled to seek a livelihood elsewhere, or shall continue to be employed where they now are at a lower rate of compensation. Whatever power the Miners' Union may have to prevent the employment of men at low wages, it certainly has none to enforce their being employed at a loss to those who pay.

If the present deep workings, in which the men who toil and risk their lives, undoubtedly deserve all the pay they get, do not hold forth a hope of profit to all concerned, it would certainly seem to be the part both of wisdom and humanity to stop them. On the latter score it is doubtful if they should not be stopped whether profitable or not. But so long as men can be found who are willing to sacrifice their health, in order to earn a trifle more money than they could get in a rational occupation; in other words, as long as there are fools to be found, to work voluntarily in such a place, as though the digging out of a little more gold and silver was the sole object of human effort, and the loftiest aim of human ambition, it is not to be expected that those who profit by the folly, without having to endure any of the hardships, will look beyond their own immediate interests. This is a matter, however, which must be settled between the parties immediately concerned.

It has long been the opinion of the writer that the natural development of our mining interests would lead to the establishment of a system of metallurgical centers, at points favorably situated for obtaining power and material, and furnished with all the appliances known in metallurgy, for the reduction of all classes of ores on a large scale.

An indispensable corollary to such a system would be the construction of narrow-gauge railroads, by means of which the ores from a considerable region surrounding each center, could be gathered in at a low cost for freight.

The advantages of such a system must be apparent to every thinking person. Not only would many costly experiments and silly projects be prevented, while many owners of mines who can now do nothing, would be enabled to work their properties, to the advantage of the community at large, but the sphere of usefulness of men of ability and experience in metallurgy, who are now wasting their time in superintending comparatively petty operations, would be greatly enlarged, and an increased number of mine owners would reap the benefit of a thoroughly scientific and comprehensive treatment of their ores, for the extraction of not only gold and silver, but also of lead, copper, antimony and all other metals that could be made profitable through the agency of large capital, and the best metallurgical skill.

The advantages of mixing different kinds of ores, for the different roasting and smelting processes, are well known to metallurgists, but it is impossible for operators in small and isolated works to avail themselves of these advantages.

Another great benefit which would result from the establishment of such works as are here contemplated, would be that the variety and magnitude of the operations carried on would necessitate the employment of a number of assistant superintendents and overseers, who, being under competent supervision, would have the best opportunity to perfect their knowledge of practical metallurgy, while young men having merely a theoretical knowledge of the art, could be received as students or workmen, and would acquire a thorough knowledge of the whole business, instead of a narrow and one-sided familiarity with one or two processes, as is now too often the case.

From events which have recently occurred in Carson City, Nevada, there seems to be some probability that a movement in this direction may soon be inaugurated at that point. Should it prove so, a solution may be found of the problem of the profitable working of the low-grade ores of the Comstock.

In the consideration of metallurgical processes adapted to the conditions of this country, the various methods of leaching ores are deserving of attention. One of the principal ob-

stacles to the introduction of these methods appears to be the very general occurrence of a certain proportion of gold in conjunction with silver in our ores, and the circumstance that no single leaching process of much practical utility, adapted to the extraction of both of the metals, is yet known. Another difficulty is that many ores are not well adapted to leaching, in the condition in which it is necessary to treat them, in the small and imperfect works to be found at the mines.

That the importance of the first obstacle has been exaggerated, and that the second may be overcome by the resources of science, when backed by a sufficient amount of capital, it will be the endeavor of the writer to show in a future article.

#### Fire on the Comstock.

The Comstock seems to be out of luck. First it is one thing, then another. First water, then fire. They lately had a big flood in the Alta, now they have a big fire at the Hale & Norcross.

At 7:30 on Wednesday evening, by the explosion of a lamp in the men's changing room, the Hale & Norcross hoisting works were set on fire. At first the men on top tried to put the flames out, but were unsuccessful, and then Superintendent Deidesheimer sent a man down on the cage to notify those at work in the mine of the fire, with directions to make their way out through the Chollar-Norcross-Savage shaft through the connection on the 2400-ft. level. After a general alarm of fire was sounded, every effort was made by the Department and men on the surface to subdue the flames, but the wind blew a gale, and all efforts were unavailing.

As soon as the flames were under control, the water was turned down the shaft to put out any brands which had fallen down, and to prevent its burning. Since connection with the Chollar on the 2400-ft. level, the shaft has had an up-cast which prevented the smoke from being carried down into the mine. The shaft is not thought now to be much damaged. There were at the time of the fire a shaft of eight men working in the ore body on the 2100 level, and the same number on the 2400 level running the north lateral drift. Considerable anxiety was manifested about the safety of the upper shift, but at nine o'clock all, together with the north station tenders and pump man, made a safe exit and were raised through the Chollar-Norcross-Savage shaft.

The works destroyed consisted of the main building, containing two hoisting engines, pump engine, air compressor, etc. On the north were the boiler room, containing four sets, the superintendent's changing-room and machine shop. East were the blacksmith shop, ore-dump and rope house. Southeast was the carpenter shop, portions of which, with the gallo frame and other strong timbers are standing. The timbers and lumber in the yard south were saved. It is doubtful if the works are rebuilt further than to raise and lower the men, as work can be done through the Chollar-Norcross-Savage shaft, of which the Hale & Norcross is part owner.

#### Water Rights.

The Supreme Court has held in the case of the Park Canal and Mining Company vs. Hoyt that although an appropriator may be entitled to the flow of the stream of water undiminished, the water above his ditch is not his personal property. The evidence in the case tended to prove that the Park company owned a ditch dug for the purpose of conducting water from the Cosumnes river to Squaw Hollow creek, and also of another ditch leading from Squaw Hollow creek at a point below the Cosumnes ditch. Hoyt diverted water from Squaw Hollow creek at a place between the two ditches. It was in evidence that at all times when the water was taken by Hoyt there was not sufficient water in Squaw Hollow creek ditch. But there was no evidence as to the quantity of water then running from the Cosumnes ditch into Squaw Hollow ditch, or that any was flowing through the ditch. For aught that appeared in the testimony all the water diverted by Hoyt was water naturally flowing into Squaw Hollow creek. If this was the case, says the court, it is clear that an action for the value of the water, as personal property, cannot be maintained. The natural bed of Squaw Hollow creek required an artificial conduit to the extent, and only to the extent, that the waters of Cosumnes river flowed through it. The water brought to Squaw Hollow creek by the Cosumnes river ditch alone, if any water can be so considered, can be considered the personal property of the Park company.

ACADEMY OF SCIENCES.—At the meeting of the Academy, on Monday evening next, A. W. Jackson of the University of California, will read a paper on "The Occurrence of the Precious Metals in Sandstones and Other Sedimentary Rocks." Prof. Davidson will present a letter from Dr. Schroder, who made the lenses for the large Berlin refractor, stating that he is now prepared to make refractors, up to 50 inches clear diameter, upon a new principle which enables him to obtain much larger dimensions with less thickness of glass than is possible with the double lens objectives.

#### Physical Studies of Lake Tahoe.—No. 3.

[Written for this Press by PROF. JOHN L. CONTRA.]

##### Color of the Water of Lake Tahoe.

One of the most striking features of this charming mountain lake is the beautiful hues presented by its pellucid waters. On a calm, clear, sunny day, wherever the depth is not less than from 50 to 60 meters, to an observer floating above its surface, the water assumes various shades of blue; from a brilliant cyan blue (greenish blue) to the most magnificent ultramarine blue, or deep indigo blue. The shades of blue, increasing in darkness in the order of the colors of the solar spectrum, are as follows: Cyan blue (greenish blue), Prussian blue, cobalt blue, genuine ultramarine blue and artificial ultramarine blue (violet blue).

While traversing one portion of the lake in a steamer, a lady endowed with a remarkable natural appreciation and discrimination of shades of color declared that the exact tint of the water at this point was "Marie Louise blue." The waters of this lake exhibit the most brilliant blueness in the deep portions, which are remote from the fouling influences of the sediment-bearing affluents and the washings of the shores. On a bright and calm day, when viewed in the distance, it had the ultramarine blue; but when looked fair down upon it was of almost inky blackness—a solid dark blue, qualified by a trace of purple or violet.

Under these favorable conditions, the appearance presented was not unlike that of the liquid in a natural dyeing vat. A clouded state of the sky, as was to be expected, produced the well-known effects due to the diminished intensity of light, the shades of blue became darker, and in extreme cases, almost black blue. According to our observations, the obscurations of the sky by the interposition of clouds, produced no other modifications of tints than those due to a diminution of luminosity.

In places where the depth is comparatively small and the bottom is visibly white, the waters assume various shades of green; from a delicate apple green to the most exquisite emerald green. Near the southern and western shores of the lake, the white sandy bottom brings out the green tints very strikingly. In the charming cove called "Emerald bay," it is remarkably conspicuous and exquisitely beautiful. In places where the stratum of water covering white portions of the bottom is only a few meters in thickness the green hue is not perceptible, unless viewed from such a distance that the rays of light emitted obliquely from the white surface have traversed a considerable thickness of the liquid before reaching the eye of the observer. The experiments with the submerged white dinner plate in testing the transparency of the water, incidentally manifested, to some extent, the influence of depth on the color of the water. The white disk presented a bluish green tint at the depth of from 9 to 12 meters; at about 15 meters it assumed a greenish blue hue, and the blue element increased in distinctness with the augmenting depth, until the disk became invisible or undistinguishable in surrounding mass of blue waters. The water intervening between the white disk and the observer did not present the brilliant and vivid green tint which characterized that which is seen in the shallow portions of the lake, where the bottom is white. But this is not surprising when we consider the small amount of diffused light which can reach the eye from so limited a surface of diffusion.

In studying the chromatic tints of these waters, a hollow pasteboard cylinder, 5 or 6 centimeters in diameter and 60 or 70 centimeters in length, was sometimes employed for the purpose of excluding the surface reflection and the disturbances due to the small ripples on the water. When quietly floating in a small row-boat, one end of this exploring tube was plunged under the water, and the eye of the observer at the other extremity received the rays of light emanating from the deeper portions of the liquid. The light thus reaching the eye presented essentially the same variety of tints in the various portions of the lake as those which have been previously indicated. Hence it appears, that under various conditions, such as depth, purity, state of sky and color of bottom, the waters of this lake manifest nearly all the chromatic tints presented in the solar spectrum between greenish yellow and the darkest ultramarine blue, bordering upon black blue. It is well known that the waters of oceans and seas exhibit similar gradations of chromatic hues in certain regions. Navigators have been struck with the variety and richness of the tints presented in certain portions by the waters of the Mediterranean sea, the Atlantic and Pacific oceans, and especially those of the Caribbean sea. In some regions of the oceans and seas, the green hues, and particularly those tinged with yellow, are observed in comparatively deep water, or at least where the depths are sufficiently great to prevent the bottom from being visible. But this phenomenon seems to require the presence of a considerable amount of suspended matter in the water. In no portion of Lake Tahoe did I observe any of the green tints, except where the light-colored bottom was visible

This was probably owing to the circumstance, that no considerable quantity of suspended material existed in any of the waters observed.

#### Physical Cause of the Color of the Waters of Certain Lakes and Seas.

The study of this beautiful colors presented by the waters of certain lakes and seas has exercised the sagacity of a great number of navigators and scientists, without resulting in a perfectly satisfactory solution of the problem. And, although recent investigations seem to furnish a key to the true explanations, yet the real cause of this phenomena appears to be very imperfectly understood, even among physicists.

For example, some persons persist in assigning an important function to the blue of the sky in the production of the blue color of the water. Thus, as late as 1870, Dr. Aug. A. Hayes, in an article on "The Cause of the Color of the Waters of Lake Geneva," (Am. J. Sci., 2d series, Vol. 49, p. 186, et seq.—1870)—having satisfied himself by chemical analysis, that no coloring matter existed in solution, distinctly ascribes the blue color of the water to the reflection and refraction of an azure sky in a colorless water. He insists that the water of this lake "responded in unequal coloration to the state of the sky as if the water mirrored the sky under this condition of beauty."

The question here presented is highly important in discussing the cause of the blue color of the deep waters. For the first preliminary point to be established, is whether the colored light comes from the interior of the mass of water, or whether it is nothing more than the azure tint of the sky, reflected from the surface of the liquid? In other terms, whether the water is really a colored body, or only mirrors the color of the sky. If the water merely performs the functions of a mirror, the explanation of the blue color of such waters is so simple and obvious that it is astonishing how it comes to pass that physicists have been so long perplexed in relation to the solution of this problem. This idea is susceptible of being subjected to decisive tests. It seems to me that the phenomena cannot be due to mirror-like reflections of the azure sky for the following reasons: (a) If the blue color of the water is produced by the reflection of an azure sky all tranquil waters should present this tint under an equally vivid blue sky. It is well known that this deduction is not confirmed by observation. (b) In looking vertically down into the blue waters—a condition rendering surface reflection very small—it is obvious that the tints emanate from the interior of the liquid. (c) When the sky is clear and the surface of the water is tranquil, the azure tint frequently far surpasses in vividness that of the sky itself. This would of course be impossible if the color was nothing more than the reflected image of the azure sky; since the reflected image must be less brilliant than the object. (d) A clouded state of the sky does not, under ordinary circumstances, prevent the recognition of the blue tint of the waters; although of course it is of less intensity. This fact is attested by a number of observers in relation to the blue waters of both lakes and seas; and it is evidently inconsistent with the idea of a mirror-like reflection of an azure sky. (e) Tranquil waters sometimes reflect the warm colors of the horizon, representing all the tints of a luminous sky so exactly that sky and water appear to be blended with each other. Under these conditions the blue tints from the interior of the liquid are overpowered by the more brilliant surface reflections; for, if a gentle breeze ruffles the surface with capillary waves, the bright surface tints vanish, and the blue from the interior immediately predominates. (f) My experiments with the "pasteboard exploring tube," seem to prove beyond question that the color-rays proceed from the depths of the water and not from its surface; for in this case superficial reflection was eliminated. (g) Finally, the character of the polarization impressed upon the blue light emanating from the azure waters of the lake of Geneva, (first announced by J. L. Soret, in the spring of 1869, and subsequently confirmed by other observers), affords a satisfactory demonstration that the blue rays are not reflected from the surface, but, on the contrary, are veritable luminous emanations from the interior of the liquid.

This point will hereafter receive special consideration in connection with the cause of the blue color. The foregoing reasons appear to be abundantly sufficient to establish the fact that in the blue waters of lakes and seas the color-rays do actually come from the interior of the mass of liquid. Moreover, the experiments of Soret and Tyndall prove that when a beam of light, thrown into an obscured chamber, is concentrated by a lens and made to pass through small masses of the blue waters taken from a number of Swiss lakes, as well as from the Mediterranean sea, the luminous cone which traversed the liquid was in all cases distinctly blue. These experimental results are absolutely demonstrative of the fact that the diffused blue light proceeds from the interior of the transparent liquid. (Soret, in "Archives des Sci., Phys. et Nat.," tome 39, p. 357—December, 1870. Tyndall, in "Nature," Vol. 2, p. 489.—Oct. 20, 1870.)

\*Indeed, in many cases this surface reflection seriously interferes with the vivid perception of the blue tints from the interior. The beautiful blue light which illuminates the interior of the famous "azure grotto" on the shores of the island of Capri, in the Bay of Naples, is of great splendor, because its waters, while receiving a full supply of the transmitted solar beams through the large sub-aqueous entrance, are protected from the surface reflection by the smallness of the opening above the water level.

#### Our New Senator.

We borrow from the *Resources of California* an excellent likeness of the new U. S. Senator from California, Gen. John F. Miller. Gen. Miller came to this State in 1853, and having received a thorough education in the profession of the law in New York and at his old home in South Bend, Indiana, where for a time he practiced, he opened a law office at Napa, and commenced to practice at that place and in this city, reaping an honorable reputation, both with the members of the bar and the community generally.

Called back to Indiana in 1856 by illness in his family, he was compelled to stay there for a time, much to his own regret, always having intended to make this State his permanent home. When Gov. Morton called the Legislature of Indiana together, at the time of the firing upon Fort Sumter, for the purpose of providing means for any requisition of men, etc., that the general government might make, Miller, who had served in the State Senate, was appointed by Gov. Morton as an aid on his staff with the rank of Colonel. Resigning his seat in the senate, he immediately organized the 29th Regiment of Indiana Volunteers, and was appointed its Colonel, and early in October, 1861, joined Gen. Rousseau's forces, then in Kentucky. In the following February he succeeded to the command of a brigade, under Gen. Buell, who was then in and around Bowling Green, and took a leading part in all the subsequent campaigns in that State. His war record is without a blemish. In all the military trusts that were given him, he showed the qualities of the soldier, and suffice it to say, that not a scintilla or breath of suspicion upon any act of his while in the army was ever brought

GEN. JOHN F. MILLER, U. S. SENATOR FROM CALIFORNIA.

against him, and the loss of one of his eyes attests to his bravery and suffering while serving his country in the field.

In September, 1865, he resigned his position in the army to return to California with his family, intending again to enter into the practice of his profession. Recognizing his worth, however, soon after his arrival he was appointed, by President Johnson, Collector of this port, which position he held until 1870, declining a re-appointment. Leaving public life, Gen. Miller engaged in commercial pursuits, which gave the fullest exercise to his executive ability. He is now to go to Washington as successor to Senator Booth.

The work of clearing out the debris of the cave that occurred on the 10th of last August, at the Spenceville copper mine, was completed December 14th, on which day the extraction of ore was resumed. Ore can be taken out and put in the sheds a great deal cheaper and more rapidly than before.

The Central City Register says that the Rothschilds purchase silver at the Boston and Colorado Smelting Works at Argo, Colorado, for shipment to China. The silver turned out at these works, to the value of nearly two millions per annum, may be called absolutely pure.

The output of the Leadville mines for the week ending December 31st, showed an increase in the aggregate and several new names in the producing list. The total output figures 799 tons. Iron Silver stands at the head with 100 tons a day; Morning Star, 80; Evening Star, 60; Chrysolite, 53; Highland Chief, 40; Silver Cord, 35; Silver Wave, 30; Oro La Plata, 30; Matchless, 25; Lee, 65.

It is reported that Geo. D. Roberts has secured a controlling interest in the Robinson Con. mine, Colorado.

#### Legislative.

This State Legislature has, so far, been doing more in the way of introducing bills than in considering any of the measures brought before it. Among those measures which may be of interest to our readers of the industrial classes are the following:

Jackson has introduced a bill providing that work on public buildings shall be done by day's work.

By May—Amending the Mining Bureau act, so as to allow the counties contributing to its fund to deduct from their collections the necessary expenses incurred.

By Brown—To add 18 sections to the Civil Code relating to mining laws.

This Nelson act, prohibiting the buying or selling of stock on margin, was referred to the Committee on Corporations.

By Enos—To allow the recovery of money paid on contract for shares of stock sold on margin.

By Enos—An act prohibiting banks and loan societies from charging fee to borrowers for examination of the title of security offered. [The same bill was introduced last year, and received the favorable report of the Judiciary.]

Cameron presented a document from the Regents of the State University, asking for an appropriation of \$45,000, and setting forth the wants of this institution. Referred to the Committee on Ways and Means.

By Lane—Also to protect the agricultural interests of California by prohibiting hydraulic mining.

By Wasson, of Mono—An act providing for

\$1.50 a day, and had riveted 900 surface yards a half mile this side of the English break. The contractor, Pat Nye, did this work for the Commissioners; did work of the same character further up the river; the contract price was 40 cents a surface yard. The witness hauled the brush farther than Nye did, while the latter received 27 cents for dirt which could be furnished at 14 cents. Bryte was then cross-examined by Parkes, and said the contract was let in sections, the whole amounting to \$10,000; he thought the price too high; the contract was let October 26th, at which time Nye ran some risk, and it was the opinion of the witness he ought to be allowed something for that; the witness was not prepared to say the contract was let too high, but he blamed the Commissioners for leaving the work in such a condition that it would have been destroyed if he (Bryte) had not done the work which he did.

State Engineer Hill testified that the dam had been under the charge of H. W. Wilson, resident engineer; he gave evidences about the general character of the work done, but said he had not inspected it since the operations ceased. In his opinion the aggregate contract was not let too high.

Niles Searles, one of the Drainage Commissioners, was the last witness examined. He recollected only one bid for the work received. The difficulty in obtaining brush caused delay, but Bryte, Carey and others said they would unite and get the material. The Commissioners then took up the bid of Nye. On some things he had bid high, on others too low. Considering the lateness of the season, October 26th, and the danger of loss in the case of flood, they had let the contract to Nye at his own figures, the work to be completed in 60 days. If the work had been done in June, it would have been from 10% to 16% cheaper. Thirty-eight cents and not 40 cents per cubic yard was the price paid for river work. The Commissioners had always let contracts to the lowest bidders.

A concurrent resolution, by Sears, on the debris expenditures and other matters, was referred to the Committee on Federal Relations. It reads as follows:

WHEREAS, The State of California has expended over \$500,000 in engineering, levees and dams, and has practically demonstrated that the river channels of this State, which are now filled with mining debris to the extent that navigation is almost destroyed, can be rectified and deepened by carrying out the recommendations of the eminent engineers, Eads, Mendell and Hall; and

WHEREAS, The rivers and bays of the State are the transportation competitor of the railroads, and should be preserved for commercial purposes of this State and coast; and

WHEREAS, The time and exigency have arrived when the general Government should take charge of this work and make the necessary appropriations to carry out the plan of improvement recommended by said engineers; therefore,

Resolved, by the Senate, the Assembly concurring, that our Senators be requested, and our representatives in Congress be instructed, to ask and urge the general Government to make the necessary appropriations without delay to carry out this important improvement.

#### A New Coal Supply.

Some time since we gave pretty full details concerning the Carbon Hill coal mine, in Washington Territory. The mine is now being worked, and the following telegram of the 5th, from New Tacoma, on Puget sound, shows that the first shipment has been made: "The steamer *Empire* sailed for San Francisco early this morning, with 880 tons of Carbon Hill coal. The bark *Fremont* is due this evening for a cargo of 600 tons."

The deposits are about 30 miles from Tacoma, but there is a railway from there to the water, and it is thought that coal can be mined and shipped to San Francisco cheaper than from any other point. The work of prospecting and getting the deposits ready has been in progress for some time, and considerable money has been expended. It is claimed that the deposits are the best and most extensive yet found on the Pacific coast. Experts say that there is nearly 30,000,000 tons of coal above high water mark or drainage line. Already 18 veins have been developed, varying from 3 ft. to 14 ft., and showing an aggregate of 118 ft. The quality of the coal resembles the famous Cumberland coal of Maryland, which is one of the highest priced coals received in this market. It is especially adapted to forges. One of the veins has been named the Pacific Cumberland. Tests from the vein, in the presence of experts, have given great satisfaction. Another vein shows very superior gas coal. It is said to be the only coke coal discovered on the coast. Thus far there has been no excitement over the discoveries, but really if the quality and extent of this coal bed be as stated, it is an event of great importance to the Pacific coast. The proximity of the deposits to the terminus of the Northern Pacific railroad and to water carriage to San Francisco render them of great value to the owners.

COL. FAIR declines to take any stock in the Carson smelting works. He says he already has too many idle reduction works.

## Deep Mining in Bodie.

From the extensive and costly preparations being made by three or four mining companies operating in this district, it is evident that we are soon to have deep mining in Bodie; and from the plain statement of facts about the underground operations and indications in the Standard mine, given by our reporter on Thursday morning, and a similarly graphic picture of the interior of the Bodie mine, appearing in this issue, it is quite as evident that the capitalists who are putting hundreds of thousands of dollars into powerful pumping and hoisting machinery are fully assured of large returns on their investments. These two leading mines of the north end are being quietly but steadily and systematically opened for more extensive and rapid exploitation, and while this is being done no effort at display or at "hulling" the stock is being made.

A good deal has been said about the "rich reserves" in the Standard, but any intelligent observer who will visit the various levels in the mine will discover that there is something like 10 years' "reserves" in sight, and all rich. But little work has yet been performed on the 700-ft. level, and yet that little reveals the fact that the two great ore veins of that mine (the Burgess having merged into the westerly vein of the two above the 700), are fully as large if not larger on that as on the upper levels, and equally as rich. These veins, where cut by the shaft, reveal a tendency to a change of dip from the west to the east, which would seem to indicate that the great ore channel below had been hurled up against the solid mountain on the west and the crest of the wave divided and curled over toward the east. On the 1,000-ft. level a cross-cut is being run to the east for the Bruce and old Standard veins, and the probabilities are that they will be cut at an early day. Don't think as soon as the new machinery is in place a cross-cut will be run west to cut the two immense veins that now lie west of the shaft on the 1,000-ft. level, and when these are developed the company will require probably not less than 100 additional stamps.

The prospects in the Bodie mine are equally encouraging. Within a few months the Lent shaft will be down below the water level and will be equipped with powerful pumping machinery. Then the Fortuna ledge, which is steadily improving in size and quality of ore as depth is attained, can be rapidly followed to great depth; and the Bruce and Burgess veins in the same mine, which yielded their millions above the 400-ft. level, will, doubtless, reveal vast treasures below the water line. This will also necessitate the erection of additional mills.

The Noondays, on the south end, are prospectively as good as the Standard and Bodie, and the Concordia and Oro, both adjoining the north Noonday, are showing strong veins of rich silver ore. This group is also troubled with water, of which they will soon be relieved by the powerful pumping machinery now being put in position at the Red Cloud shaft. This shaft is being sunk with the greatest possible rapidity and will be driven to great depth, the intention being to make it the sump of the south end. The Noondays have two great ore veins, both rapidly improving as they descend, and sinking will be resumed as soon as the Red Cloud pump relieves them of water at the depth already attained, about 560 ft.

Within a few months the Red Cloud and Lent shafts will have attained sufficient depth to enable work to be prosecuted through them. In the meantime there is sufficient ore above the water level to keep all our mills running steadily for years. We believe that below that line greater mints will be found to exist than above, and that that belief is shared by those who have the largest interests in Bodie is evidenced by the extensive and expensive operations in progress to work at great depths.—Free Press.

**NEVADA COUNTY MINES.**—In order to show the extent of the mining industry in this county we desire to call attention to the fact that Hartwell's new map of Nevada county shows 342 claims, which represent the greater portion of the valuable mineral properties already discovered. Of this number 113 are gold quartz and 229 are gravel. There are also several valuable copper and iron mines in the county. The total assessed values of mining properties are as follows: Mining claims and improvements, \$2,353,640. Mining ditches and improvements, \$1,051,495. Total number of mining ditches, 217, having a total length of 824 miles. There are 44 quartz mills, having 503 stamps.—Transcript.

**THE OLD MINING RECORDS.**—F. H. McAllister is engaged in copying for the United States Geological Survey, the old laws of Nevada county and the names of locations made in Grass Valley district prior to 1854, as set forth in the pioneer records still on file at the County Recorder's office. Among the names given by the early prospectors to the leads and localities mentioned are some rather amusing ones, such as Sebastopol, Poverty lead, Good Time Coming ledge, Poppy Squash Hill, Mary's Diggings, Carhuncle Hill, Cave In Hill, etc.

**MINING LOCATIONS.**—The number of mining claims located in Nevada county during the year 1880 are shown by the County Recorder's books to be as follows: January, 48; February, 34; March, 56; April, 31; May, 26; June, 39; July, 45; August, 40; September, 45; October, 31; November, 22; December, 21. Total locations for year, 438.

## Business Directory.

We furnish Telephones for \$10 per set. Wire, 5 cents per rod; Insulators, 15 cents each for every 200 feet of line. Illustrated instructions for putting up.

Brass and Steel Wire Screens, Hardware and Fancy

Goods, Opera, Field and Marine Glasses,

Optical Instruments, Etc.

Nos. 521 and 523 MARKET STREET, S. F.

The attention of Assayers, Chemists, Mining and Milling Companies is particularly called to the complete stock of Balances, Furnaces, Crucibles, Brass and Steel Wire Screens, etc., including all the necessities for Assayers and Miners, as also for Milling men. An experience of 80 years in this line of business enables me to guarantee a strict attendance to the orders which my friends may entrust to me. Gold and Silver Tables and a full list of articles to be found in my store, to be had on application.

**Mining and Scientific Press**  
**Patent Agency.**

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY WAS established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice free. Address, **DEWEY & CO.,**  
Office MINING AND SCIENTIFIC PRESS and PACIFIC RAIL PRESS, 202 Sansome Street, S. F.—1880.

**INGERSOLL****Rock Drill and Air Compressor.**

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Comstock.

**GEO. R. FOARD, GEN'L AGENT,**

No. 13, First St., S. F.

**CAUTION.**

To John B. Reynolds and the firm of Reynolds & Rix, and their Public generally.

Notice is hereby given that George R. Foard, of No. 13 First Street, San Francisco, is the sole authorized agent for the sale of our manufactures, consisting of **Rock Drills, Air Compressors**, and duplicate parts of either in the territory known as the **Pacific Slope**, formerly under the agency of John B. Reynolds, but now under the sole agency of George R. Foard; and that no other person or persons have any right or authority to represent themselves as the agents of this Company within the above mentioned territory.

Also, take notice, that all persons manufacturing, or using any Rock Drills, Air Compressors, or duplicate parts of either, manufactured by others, embracing in their construction the mechanical inventions and appliances covered by the Patents owned by this Company, will be prosecuted for such infringement.

**INGERSOLL ROCK DRILL CO.**

New York, November 30, 1880.

**Scientific and Practical Books**  
**on Mining, Metallurgy, Etc.**

Published or issued, wholesale and retail, by **DEWEY & CO.,** MINING AND SCIENTIFIC PRESS Office, S. F.

**BY GUIDO KUSTEL,**

MINING ENGINEER AND METALLURGIST.

**Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.**

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

**ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.**

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, equipments and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3.00 coin, postage free.

**SAVE YOUR**  
**GOLD AND SILVER.**

I am prepared to demonstrate, if miners will bring me from 500 pounds to a ton of their ores, that I can save from 25 to 100 per cent. more than any other machinery now in use. I will make no charge.

Machinery can be seen in operation every day at **No. 143 Fremont Street.**

**M. B. DODGE.****New Book on the Comstock.**

The attention of **MINING ENGINEERS** and **EXPERTS** is called to the new work by **JOHN A. CHURCH, E. M. PH. D.**, on "The Comstock Lode, Its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. **DEWEY & CO.,** Publishers of the **MINING AND SCIENTIFIC PRESS**, are sole agents for the sale of the work. Mr. E. M. SLEATON will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

Manufacturer of the Best

**Improved Artificial Limbs.**

OFFICE AND ADDRESS:

9 Geary Street, Junction of Market and Kearny, S. F.

**Metallurgy and Ores.**

**Nevada Metallurgical Works,**  
No. 23 STEVENSON STREET.  
Near First and Market Streets.

Ores worked by any process.  
Ores sampled.  
ASSAYING in all its branches.  
Analysis of Ores, Minerals, Waters, etc.  
WORKING TESTS MADE.  
Plans furnished for the most suitable process for working Ores.  
Special attention paid to Examinations of Mines; plans and reports furnished.

E. HUHN,  
C. A. LUCKHARDT,  
Mining Engineers and Metallurgists

**JOHN TAYLOR & CO.,**

IMPORTERS OF AND DEALERS IN

**ASSAYERS' MATERIALS,**  
**MINE and MILL SUPPLIES,**

**CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
GISTS' GLASSWARE AND SUNORIES, Etc.**

118 and 120 Market Street, and 15 and 17  
California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full Stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods both as to quality and price. Our *New Illustrated Catalogue*, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

JOHN TAYLOR &amp; CO.

A. N. RIOTTE, H. KUSTEL, GUIDO KUSTEL.

**METALLURGICAL WORKS,**  
318 Pine St., (Basement),  
Corner of Leidesdorff Street, - SAN FRANCISCO

Ores Sampled and Assayed, and Tests Made by any Process.  
Assaying and Analysis of Ores, Minerals and Waters.  
Mines examined and reported on.  
Practical Instruction given in Treating Ores by approved processes.

G. KUSTEL,  
E. N. RIOTTE,  
Mining Engineers and Metallurgists.

(Successors to W. I. TUSTIN.)

**Engraving.** Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the Mining and Scientific Press, San Francisco, at favorable rates.

**FRANCIS SMITH & CO.,**

Manufacturers of

**THE PATENT CHANNEL IRON WHEELBARROWS.**

THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand.

**SHEET IRON PIPE.**

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.

Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

SHEET IRON PIPE.

**ASBESTOS.**

CONSTANTLY ON HAND

Asbestos { Board 1-32 Inch to 1-4 Inch Thickness.  
Sheathing 1-64 and 1-32 Inch Thickness.  
Packing 1-4 Inch to 1 1-2 Inch Diameter.  
Yarn for Valve Stems, Etc. } Asbestos.

ESTIMATES GIVEN FOR COVERING BOILERS, DRUMS, STEAM PIPES, Etc.

**The Largest Stock on the Pacific Coast.**

B. S. HILL, Agent, Nos. 317, 319, and 321 Mission Street, San Francisco.

**GOLD MINERS**

WORKING PLACER, GRAVEL AND QUARTZ MINES,

**SAVE YOUR GOLD!**

- BY USING -

**SILVER PLATED AMALGAMATING PLATES.**

The most economical and successful process now in use. Will warrant my Plates to save a very much larger percentage of gold than any other method.

SWING AND RIFFLE PLATES for Saving Float Gold Made to Order.

OLD MINING PLATES BOUGHT, TAKEN IN EXCHANGE FOR NEW, OR RE-PLATED.

ALL KINDS OF METAL GOODS PLATED!

**San Francisco Gold, Silver and Nickel Plating Works,**

653 and 655 Mission St., bet. New Montgomery and Third, San Francisco.

Send for Circular.

## PATENTS AND INVENTIONS.

### List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.

For the Week Ending December 23rd, 1880.

235,852.—CAR TRUCK.—W. T. Browne, Stockton, Cal.  
235,136.—SWITCH.—Jannaro S. Clements, S. F.  
235,939.—STOVE.—C. H. Dunton, S. F.  
235,872.—ORE FEEDER.—J. Hendy, S. F.  
235,965.—SINKING TUBE.—Harvey R. Leonard, S. F.  
235,065.—PRESERVED WOOD.—H. G. Muller, S. F.  
235,390.—GANG PLOW.—Christian Meyers, S. F.  
235,894.—STEAM PAVING.—Geo. C. Phillips, Silver City, Nev.  
235,967.—LEVER.—N. Sewell, Marysville, Cal.  
235,871.—EXPLOSIVE COMPOUND.—Wm. Heick, S. F.  
Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

**METHOD OF RELIEVING RIVER CHANNELS OF SEDIMENT AND FORMING LEVEES.**—Newton Sewell, Marysville, Yuba Co., Cal. Patented Dec. 23, 1880, No. 235,967. This method is for relieving the channels of water courses from the sediment which may be brought down by the water, and for utilizing the same in the formation of levees upon each side of the stream, to aid in the reclamation of the land; and it consists of a dam or dams built across the stream, and having flumes or ground cuts leading out therefrom to the banks of the stream below. At suitable points upon the banks of the stream, below the dam or dams, a succession of inclosures are formed, of earth, either loose or in sacks, or other material formed in any suitable manner, so that the water from the flumes may be led into them and the sediment contained in the water allowed to settle, the water being drawn off and allowed to flow back into the stream. When the first inclosures have been filled with the sediment, the flumes are allowed to discharge into the next inclosures, and the levee may thus be built of any desired length, width and height. By adding to the inclosing walls and filling the new space, any height may be attained.

**COOKING STOVE.**—Charles H. Dunton, Oakland, Cal. Patented Dec. 23, 1880, No. 235,939. This invention relates to certain improvements in that class of portable stoves or ranges which are employed for the purposes of cooking, and in which two ovens and a single fire place are used; and it consists in the novel construction of an oval or similarly shaped outer case, having a centrally located adjustable cylindrical fireplace with independent ovens and cooking compartments upon either side, with flues and dampers, whereby either one or both sides may be employed with the same fire simultaneously or independently. This stove is simple, inexpensive, occupies but little space, while having large capacity; and the fire and amount of space may be regulated for the work to be done.

**PROPOSED ARCTIC EXPEDITION.**—A *Tribune's* New York special says: A short time ago Lieut. Schwatka received a communication from Commander Chenet, of the British Royal navy, a distinguished Arctic explorer, proposing an international polar expedition, and inviting his co-operation. The letter was accompanied by similar recommendations signed by many of the most prominent British officers who have participated in Arctic explorations, or made them the subject of study. In it was also a suggestion inviting American capital from private sources in the enterprise. Capt. W. Parker Snow, of the British Mercantile Marine, who was one of the early searchers for the lost crews of the *Erebus* and *Terror*, has also written a letter to Lieut. Schwatka, asking his co-operation in another expedition. Capt. Snow proposes to get up a new search by Lancaster sound westerly, then back to the magnetic pole, for any further information of Franklin's party, and afterward going through to Behring's straits.

**BUSINESS AT THE PORT OF WILMINGTON.**—Following is a statement of the number of vessels arriving and the amount of freight received at the port of Wilmington for the year of 1880: Steamers, 106; sailing vessels, 127; merchandise, 13,230 tons; lumber, 13,031,559 ft.; coal, 25,859 tons; railroad ties, 494,101; shingles, 550,000; barley, 150 tons; telegraph poles, 2,000; lime, 415 barrels. This is an artificial harbor, the only one on the coast.

The business outlook of Bodie affords the people a great encouragement. Those houses which survived the late depression confidently look forward to a season of prosperity. The bullion shipments for the last year by Wells, Fargo & Co. aggregated \$3,063,699.13; and by banks and private individuals \$93,445.26. This shows an increase of over half a million over the shipments of 1879.

### Our Home Industries.

#### Herman Royer's Belting Factory.

Few of our readers have a definite idea, much less a just conception, of the quantity of belting used for the various machine purposes on this coast; or the amount of capital, time and labor involved in its manufacture. The special purposes to which belting is put in a large machine shop are multifarious. Not only is it instrumental in the direct transmission of power, but it has almost wholly superseded gearing for the increasing and diminishing of velocity, for changing positive into negative motion, and for pulley purposes. Its almost noiseless operation, non-friction property, and consequently entire emancipation from the necessity of lubricating agents, have caused it to become one of the great essentials in the mechanical operations of the world's machinery.

The manufacture of leather belting, rawhide rope, lacing, etc., in this city, is quite extensive. The factory of Mr. Herman Royer, Nos. 855, 857, 859 and 861 Bryant street, corner of Park avenue, between Fifth and Sixth streets, is one of our most promising home industries.

This business is carried on in a large building 75 ft. long by 50 ft. wide, and four stories high, and utilizing four full lots. On the premises is an artesian well which supplies the whole establishment with an abundance of the purest water. A 20-horse power steam engine drives the machinery, while a force of 12 men is required to manipulate the work. The whole business necessitated an investment of over \$60,000. Mr. Royer devotes his personal attention to the selection and purchasing of green hides, ships them to Santa Clara and Santa Cruz, where they are carefully and expressly tanned for the purpose with none other than California oak bark.

The "fulling process" is something entirely original, having been brought into being through the inventive faculty of Mr. Royer himself. As the term implies, the hides, while in a green condition, are subjected to a peculiar mechanical operation, which as actually and thoroughly fulfills them, as cloths fresh from the looms are filled in all our woolen factories. It will be readily understood, even by the uninitiated, that hides treated in this way will become wonderfully soft, flexible and pliable. Every fiber in the original tissue is brought into due play, and finds its own commensurate bearing.

The special advantages of this fulling process are best seen and appreciated in the manufacture of rawhide, belting and lacing, a great variety of which is turned out and shipped abroad from this establishment.

Mr. Royer tells us that his best hides come from Oregon and Washington Territory; a compliment which should be justly appreciated by our northern farmers and stock raisers. The trade-mark adopted by Mr. Royer is about as unique as it is expressive. It represents a Mexican ranchero on his "broncho" pursuing a wild bull which is running for dear life, but whose hide is wanted to subserve the purposes of civilization.

The fulled rawhide rope above mentioned is a specialty. It is manufactured round, solid and twisted, and of sizes ranging all the way from one-half to an inch in diameter.

The standard, oak-tanned leather belting is made from 1 to 30 inches wide. Every belt bears on each second joint the manufacturer's name and trade-mark, together with the word "Standard." The variety called "Short Lap" belting, is made from oak-tanned hides, discarding the shoulder part of the hide, which goes into the Standard belting, where it forms the "long laps."

As in other departments of the work, the green hides are carefully selected and tanned for this purpose. Every second joint of this, also, bears the maker's name, trade-mark, and the words "Short Lap."

Still another variety, called the "Combination," is essentially a most durable belting. One side of this is made of oak-tanned leather, while the other consists of rawhide made pliable by the process already alluded to above. The object to be attained by this double belting, is to effect a certain compensation rendered necessary in all heavy machinery, the minutiae of which are fully understood by all experienced millmen.

Mr. Royer has been 13 years in working up this business. He is a live man in the truest acceptance of the term, and exactly the right man in the right place. So well known and appreciated are his goods that he is surfeited with orders from the East, the West, the North and the South. For more full particulars regarding this establishment, we refer our readers to Mr. Royer's printed catalogue, which gives a more detailed account of this important industry.

**SCIENTIFIC PRESS.**—On New Year's day the S. F. SCIENTIFIC PRESS entered upon its XLII volume. The topics treated by this journal commend it to all classes—miners, artisan, mechanic, agriculturist, professional and business man.—*Bridgeport (Mono county) Chronicle*.

The License Collector reports that he has paid to the State Mining Bureau \$3,520, under the act of the Legislature providing for a 10-cent tax on certificates of transfer of mining stock for the last quarter.

### California as a Cotton State.

There is reason to believe that California has a future both in cotton growing and cotton manufacturing. The cotton grown last year was quite satisfactory to the growers and to purchasers, and it was quickly taken in the place of southern cotton which has hitherto been imported by our makers of "all wool" fabrics. It is a matter of note that Prof. Hilgard, who is superintending the cotton department of the census of 1880, found such quality in the samples grown here and such adaptation in his study of our conditions of soil and climate that he assures us that California will be treated as one of the virtually, if not actually, cotton-growing States in the work and publications of this tenth census. In a recent note to the *Bulletin* Prof. Hilgard assigns these reasons for concluding that California is fitted for a cotton-growing State and will be benefited by it:

I have during the past season investigated fully the question of cotton production in various parts of California, and I am satisfied that from Napa down to San Diego, an excellent staple can be grown. The best varieties of seed remain to be determined yet, and it is to be hoped that this will be done promptly and systematically. What renders this culture of especial importance to California is the fact that, being a deep-rooted plant and requiring summer cultivation, it can be successfully grown in lands too alkaline to be permanently available for cereal culture, as is largely the case at the head of the San Joaquin valley. Furthermore, unlike cereal culture, cotton-growing can easily be made to improve instead of impoverishing the soil, by inaugurating at the onset the simple system of return to the land, by giving back the seed-cake. The lint of cotton takes so little plant food from the soil that this simple restoration is, in all practical respects, a permanent one. I am satisfied that when the merits of this culture once come to be generally understood, not one but a dozen cotton mills will be wanted to furnish a market for the product.

There is reason to expect the speedy equipment of a cotton mill in this city. The daily papers have printed accounts of the plans of Mr. J. W. Tripp, a practical cotton manufacturer, who proposes to carry out the enterprise. Mr. Tripp assures the reporters that the project is received with much favor, both by the capitalists and the working classes, who desire moderately remunerative employment for their young people. He thinks he can find abundant hands among the white youth and will not invoke mongolian aid. Property owners look upon the beginning of cotton manufacturing in this city as likely to advance their interests, and certainly farmers will be pleased to grow cotton if they can be shown a profit in it.

Mr. Tripp's views upon the subject of cotton-growing and its relation to our general prosperity and advancement as a State are certainly forcible. He believes he could import cotton from the south by the railroad soon to be opened and manufacture it at a profit, but he hopes to get California-grown material. He points to the valley of the San Joaquin, 300 miles in length by about 50 in width, which ought to be one vast cotton field, because of its peculiar adaptation to that product, and yet we send abroad for the hags to put our flour in. This is all wrong. The State will never see its highest prosperity until we learn to grow the raw material which will least impoverish the soil, and then work up that raw material here at home into fabrics which everybody uses, and give employment to our labor, growth to the city and a home market to our farmers. Mr. Tripp believes this State offers peculiar advantages for cotton manufacturing and especially great if we grow the raw material. Massachusetts brings all her raw cotton from the Southern States and grows rich at manufacturing, in spite of a most bitter winter climate for nearly half the year. We are one of the contributors who enrich that State, and yet we can grow the cotton in California, and have on this peninsula the very best climate in this world for the manufacture of it.

There certainly seems every reason for the uprising of the cotton industry in this State. The growing is certainly going forward. Haggin & Carr raised last year in Kern county about 200 bales of cotton, and are intending to raise from five to ten thousand bales this year. Unless we establish cotton manufacturing, that cotton will be sent away just as hides and wool are, and then brought back to us at enormously enhanced prices in the shape of coarse cotton clothes. Mr. Tripp proposes to put a stop to that ruinous process by erecting a large cotton factory and working up that cotton right here in San Francisco, by employing the men and women, boys and girls of this city who are waiting and hoping for employment. We trust his looms will soon be humming.

BEN WOODS, an old resident of Pioche, returned from Tombstone last Saturday. He says there are a number of excellent mines down in that country, containing large bodies of rich ore, but that the country is fearfully overdone, there being from five to seven men to every job, and streams of men constantly flowing in from all directions. It is no place for a man in search of employment to go.—*Pioche Record*.

The New York *Tribune* has made a discovery that the business of mining stock dealing may decline while mining as a productive industry is prospering. The stock sharps on this coast have never been able to make this subtle distinction. They have always imagined that the "mining industry" of California had no existence outside of Pine street.

### News in Brief.

CORN product of Los Angeles county for 1880, 800,000 bushels.

The fire insurance companies report a poor business during the year.

LATER advices do not confirm the report of the capture of Lima by the Chileans.

APPEALS are being made in New York for the relief of colored refugees in Kansas.

It is reported that the Western Union and American Union telegraph companies have been united.

THERE were 937 patients—596 males and 312 females in the Napa Insane asylum on December 31st.

BONANZA CITY promises to be the liveliest mining camp in Idaho this spring. Five new mills are already promised.

O'LEARY has accepted Sir John Astley's challenge to furnish a pedestrian to walk against Rowell for \$10,000.

DIPHTHERIA is prevailing to an alarming extent in portions of Yamhill county, Or., and a number of deaths are reported.

THE total indebtedness of San Benito county on January 1, 1881, was \$456,387.29. Of this amount \$369,065.60 are in bonds.

ON Friday, at Reno, Nevada, a man named Antone Astroden accidentally cut off his foot at the instep while chopping wood.

It is understood that Justice Swayne will retire from the Bench next week, and that he will be succeeded by Stanley Matthews.

THE Indian Appropriation bill was passed by the House yesterday, but the Board of Indian Commissioners was lopped off as a needless excrescence.

THE cold weather at Chihuahua surpasses any thing of the kind within the memory of the oldest inhabitant. There has been ice in Paso del Norte two inches thick.

THE house of a Protestant minister residing in Jalapa, having been stoned by fanatics, the government immediately took measures for the punishment of the offenders.

THE syndicate in Calcutta formed last summer for the purpose of introducing Indian tea into the Austrian market has resolved to extend its operations to the United States and Canada.

JESSE T. BOWLES, a farmer of Clark county, W. T., while hutchering a calf a short time since, was kicked by the animal on the hand which held his knife, and the blade was driven four inches into his thigh.

LAST Sunday three Indians shot at two Chinamen near the mouth of the South Yuba, half a mile below Bridgeport. One Chinaman was instantly killed, the other escaped without injury. The Indians were arrested.

THE New York World's Fair Commission report that generous subscriptions are being made. Mayor Grace welcomed the members of the Commission to the city. An address setting forth the object of the Commission is issued.

THE scheme for the construction of the Grand Eastern railroad from Pesth through Belgrade to Constantinople, under international auspices, has been submitted to the Austrian and Serbian governments, and to a great London financial firm.

THE Fenian scare has extended to Portsmouth. The authorities have received anonymous warnings of contemplated attacks on Government establishments. They do not attach much importance to the warning, yet have taken some extra precaution.

DR. MEARES, the Health Officer, having notified the trustees of the Free Public Library that the small-pox epidemic has materially diminished, and that the library need no longer be closed for circulation, it has again been opened for the circulation of books as usual.

THE United States Consul in Venezuela informs the Department of State that he is trying to organize a scientific and commercial exploring expedition of Americans to visit Venezuela. He regards the opportunity for American merchants in that country as very good.

THE New York *Times*, regarding the meeting of the World's Fair Commission: "It is not easy to see how an organization originated as this was, and conducted as it has been up to this time, is to be brought readily into effective working order for so gigantic a task as it is struggling with."

A WRITER in the New York *Sun* says General Grant will probably start for Mexico within the next 30 days for the purpose of obtaining accurate information, and forming an opinion as to several concessions for the benefit of the Consolidation Committee of the Mexican railway, of which he is a member.

A HOLLAND correspondent writes that the suggestion of Rotterdam newspapers, that members of the Red Cross be dispatched to the Transvaal to aid the wounded Boers, has been received with lively sympathy. A subscription is talked of for the purpose of starting some surgeons immediately for the Transvaal.

OUR Consul at Maracaibo, Venezuela, in a dispatch to the State Department, says he is trying to organize a scientific and commercial exploring party in the United States to visit Venezuela this winter for the double purpose of seeing the country and people, and examining the interior water courses, with a view to utilize them by a system of canals for inland transportation. Inasmuch as the United States occupies a foremost place in Venezuela markets, and can extend its trade indefinitely with proper effort, it is urged that it is important our merchants should become conversant with the country and its needs.

## The Californian.

THE RISING MONTHLY OF THE DAY. YEARLY SUBSCRIPTION \$4. Single number 35 cents. **AGENTS WANTED** in every town and village of the United States to canvass for this popular magazine. The most liberal commissions will be paid to responsible parties. This is a chance to make money at your own home. Address

THE CALIFORNIA PUBLISHING CO.

(P. O. Box 2319) 202 Sansome St. S. F.

## Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St. S. F.

## Various Causes—

Advancing years, care, sickness, disappointment, and hereditary predisposition—all operate to turn the hair gray, and other of them incline it to shed prematurely. **AYER'S HAIR VIGOR** will restore faded or gray, light or red hair to a rich brown or deep black, as may be desired. It softens and cleanses the scalp, giving it a healthy action. It removes and cures dandruff and humors. By its use falling hair is checked, and a new growth will be produced in all cases where the follicles are not destroyed or the glands decayed. Its effects are beautifully shown on brashy, weak, or sickly hair, on which a few applications will produce the gloss and freshness of youth. Harmless and sure in its operation, it is incomparable as a dressing, and is especially valued for the soft luster and richness of tons it imparts. It contains neither oil nor dye, and will not soil or color white cambric; yet it lasts long on the hair, and keeps it fresh and vigorous.

FOR SALE BY ALL DEALERS.

THE AMERICAN EXCHANGE hotel, so well known to all the traveling public, has been refitted, overhauled and put in first rate condition, and is now under the management of Charles Montgomery, proprietor of the three "Montgomery Hotels" on Second street, in this city. He is an old hotel man, having had many years experience. He will run the American Exchange on improved principles. The building has been thoroughly renovated.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has now varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Chew JACKSON'S BEST Sweet Navy Tobacco

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

DEWEY & CO.,  
American & Foreign Patent Agents.

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

## Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Pern, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

## Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

## Home Counsel.

Our long experience in obtaining patents for inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

## Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

## DEWEY &amp; CO.

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 202 Sansome St. N. E. corner Pine, S. F.

INCERSOLL  
ECLIPSE ROCK DRILLS.

The Most Economical Air Compressor in the Market.

## MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

## Mining &amp; Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supply. Iron Work complete for Wood Frames, also.

**SPERRY'S  
WROUGHT IRON FRAME  
FOR STAMP MILLS.**

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

Cups for Engine, Machine and Shaft Bearings and Loose Pulleys. We furnish the Albany Compound (a solid), \$1 worth of which will last as long as from \$2 to \$10 worth of Oil, with no stop, and with ONE-THIRTIETH the ATTENTION required by the best Oil Cups.

If the Cups are not satisfactory, we will receive them back and make no charge.

Cylinder corrosion is not so much owing to impure tallow or oil as to the fact that those animal fats do not maintain their integrity under steam heat, but decompose and set free acids which attack and destroy metal.

The Albany Cylinder Oil does not contain fatty acids—is incapable of being decomposed and does not form insoluble soaps. If it becomes mixed with boiler incrustation it diminishes its tendency to cling to the sides of the boiler, and thus exerts in this respect also a beneficial action.

#### THE ALBANY Cylinder Oil

The Cheapest and most economical Cylinder Cup. Can be instantly regulated to feed a few drops per minute, and the drops can be counted as they pass through the glass gauge.

#### Pure Winter Strained Lard Oil

By every vessel from New York.

#### ALBANY SPINDLE OIL,

Genuine West Virginia Lubricating Oil,

SIGNAL OIL for outside lights of vessels, etc.

The Albany Lubricating Compound and Cups, the Albany Spindle Oil, etc., can only be gotten from us or our agents. Send for catalogues.

Entirely different from other Saws. When dull, sharp teeth, which only cost a trifle, can be inserted in a few minutes, without taking the saw off of the mandrel, and no skill is required in doing it. Send for Catalogue showing their vast superiority. More of them are being sold than of any other kind, and we are altering all other kinds to the Chisel Tooth.

## A Timber Framing Machine.

Isaac Lepley, of Amador City, Amador Co., has recently invented a novel piece of mechanism, which is intended for the framing of timbers of all kinds, which are to be joined together. One of the machines is now in operation at the Keystone Con. mine, Amador. We present an engraving of the machine on this page.

The invention consists in the employment of a cutter head or heads, which are caused to rotate upon a suitable frame, and this frame is moved both vertically and horizontally by means of slides and guides, so that the cutters may be carried across the timbers upon either one or all four sides to form a tenon, dovetail, or other cut; and if desired, a round tenon may be formed by the use of a link which has one end fixed to the frame, so that the slides will move in a manner to carry the tool around in a circle.

In the engraving, *A* represents the cutter head, which is caused to rotate upon its shaft by a belt to the pulley, *B*, so that the cutter acts as a planer. It may be of sufficient height for the tenon to be cut, or by moving the timber or carriage the length desired may be cut at two or more operations. Its shaft is journaled at the top of a frame, *C*. This frame is moved up and down in guides upon the frame, *E*, by means of friction rollers, *F*, which press against a vertical central bar, *K*, which extends parallel with the frame, *C*. These rollers, *F*, are driven by pinions upon their shafts, and a hand wheel or other device upon a main shaft at the end of the machine, as shown.

The frame, *E*, is also adapted to move horizontally upon the main frame, *G*, by means of similar gearing to that which moves the frame, *C*, and by these two motions, it will be seen that the cutters may be moved in any direction. The log is laid upon a carriage with its end near the frame, and its height is so adjusted, that when the frame, *E*, is moved across horizontally, the revolving cutters will be carried across, so as to make a cut to the depth desired.

The frame, *C*, is then moved downward, and the cutters will cut the vertical face upon one side. The frame, *C*, then remains stationary, while the frame, *E*, is moved horizontally backward upon the guides on the main frame, and the cutters will complete the lower part of the tenon. The frame, *E*, is then held stationary and the frame, *C*, is again moved upward, so that the cutters will be carried upward across the remaining side, and the tenon will be finished.

The cutters are blades secured to a head similar to those used upon planer heads, but in order to make the vertical cut at the inner end of the tenon so that it will present a clean, square surface, sliding plates are fitted to move in grooves on the end of the planer head. Their outer ends are toothed, or formed so as to make the proper cut, and they are held in place by set screws.

In order to allow the cutter shaft and its driving pulley to move in the directions and to the distances as described, the belt which drives it is carried over tightening pulleys, suitably arranged in sliding frames with weights.

The tenons here described are those which are usually made upon the ends of the timbers used in timbering up mines. The timbers are united, and these tenons allow the timbers to be properly set together. It will be obvious, however, that this apparatus may be employed to make any kind of a cut on a timber or to square up the ends of timber, as the cutter may be moved in any direction required.

Upon the end of the cutter shaft opposite the planer head is a peculiarly shaped boring and cutting tool, *J*, which is intended to form mortises either in the sides or ends of timbers. The end of this tool is nearly flat, but is provided with a cutting bit, which enables it to enter the timber as far as may be desired.

The sides of the tool (which is cylindrical in shape) are cut away so as to form an enclosed cutting edge, and after it has entered the timber far enough to give the required depth, the frame, *E*, may be moved upon the frame, *G*, where the side cutter will cut away the wood until the mortise is as long as desired. The same style of cutter may be employed to form what is termed the boxing, or the depression which is cut across the timber equal to the length of the

mortise, to receive the foot of the timber which is tenoned to fit the mortise.

The tenon to fit the mortise is formed by the cutter, *A*, in the same manner as has been described, except that the ends must be rounded to fit the ends of the mortise, which may be left curved by the tool, *J*. In order to make these rounded ends to the tenon, it is necessary to produce a compound motion of the two frames, *C* and *E*, one which, as before described, moves vertically, while the other moves horizontally.

This compound motion is produced by the aid of an arm, *K*, which has one end pivoted to this side of the vertically moving frame, *C*. The opposite end is adapted to slip into a slot in a block, *L*, which is pivoted to a slide, *M*, this slide moving in a slot in the bar, *N*, which extends from end to end of the frame, *G*, and inside the frames, *E* and *C*. Two stops, *O*, are fitted to be moved to or from each other by the long right and left screw, *P*, these stops having projections which enter the slot in the bar, *N*, and they serve to limit the motion of the slide, *M*, and block, *L*. When a tenon is to be made with rounded ends, the bar or arm, *K*, is slipped through the slot in the block, *L*, and is secured by a set screw. This arm is secured at a dis-

so as to produce a compound movement, the resultant of which will be to form a cylindrical tenon.

This machine is applicable to work upon any form of timber and make any kind of a cut. The tool, *J*, may be made with cutters which can be detached, to be sharpened or renewed. Mr. Lepley, who may be addressed for further information at Amador City, has applied for a patent for his invention through the MINING AND SCIENTIFIC PRESS Patent Agency.

## A Double-Breast Steam Wheel.

We saw at the National Iron Works this week, a new form of rotary engine invented by Henry Thibault and Thomas Hawkins, of this city, who have applied for a patent for their device through the MINING AND SCIENTIFIC PRESS Patent Agency. The machine we saw at work is a small one, the whole engine, fly-wheel and all only weighing 250 lbs., and the fly-wheel weighs 140 lbs. of that. The same inventors patented a rotary engine in August last, and this is an improvement on the previous patent.

LEPLEY'S MACHINE FOR FRAMING TIMBERS FOR MINES.

tance from the point about which the arm turns, equal to half the thickness of the proposed tenon added to the whole diameter of the cutter head, as the latter must pass all around the tenon.

The stops, *O*, are adjusted by turning the screw, *P*, until they are at a distance apart equal to the width of the tenon to be made, plus the diameter of the cutter head.

The operation will thus be as follows: The frame, *C*, being set at a point which will allow the cutter to form the top of the tenon, the frame, *E*, is moved horizontally upon the main frame, *G*, until the slide, *M*, has moved the distance between the stops, *O*. This carries the cutter across the top of the tenon to the point where the curve of one side or edge commences. From this point the frame, *C*, is moved downward, and the frame, *E*, horizontally, the arm, *K*, acting as the radius or link to hold the frames in their relative positions and cutter to its work, until it has passed around the side and formed the curve at that part of the tenon. The arm, *K*, having then passed around its pivot to form a half circle, the frame, *C*, is allowed to remain stationary, and the frame, *E*, is moved along to allow the cutter to form the bottom of the tenon, the slide, *M*, moving the distance between the stops, *O*. From this point the curve at the opposite side of the tenon is formed in the same manner as before described.

If it is desired to form a complete cylindrical tenon, the stops, *O*, are curved up close to the slide, *M*, the block, *L*, having been secured to the arm, *K*, at a distance from the center pivot equal to half the diameter of the proposed tenon, plus the diameter of the cutter, and the frames, *C* and *E*, are then moved simultaneously,

The nacking of the joints between the edges of the drum and the case is effected by the use of a metal ring and a packing of hemp, inside of which is a ring which fits against the flange of the disk, while the other ring serves to press the hemp against the joint. This is ingeniously arranged, and makes a perfectly tight joint; so much so that the sides of the case are left open, as was the case with the engine we saw running this week.

The inventors intend to compound this engine by having a similar engine on the same shaft, with a larger area, and the exhaust steam from the small engine will pass into the larger one. This will admit of a very economical use of steam. This engine can be reversed instantly, by simply shifting the valve, rocker shaft, link motion, etc., being dispensed with. We are told that on account of the small amount of machinery required the engine can be made at less than one-half the cost of an ordinary engine of the same horse power. In construction there is very little hand work required, most of it being done with lathe and planer. All the wearing parts are so made as to be self-adjusting. The machine takes steam on opposite sides and there is therefore no special strain on the shaft at any part of the circle, because the pressure of steam is equal on all sides. It is really a double breast steam wheel. The parts are self-adjusting and can easily be replaced when worn. The inventors claim much less friction on this than on other engines, and say that experts acknowledge that from what they can see at present there is nothing that shows any more chance for wear than on any other ordinary engine. The machine uses a rotary cut off, and steam can be cut off at any desired point, the

same as with an ordinary engine. There are no dead points so there is no special limit to the speed. The engine can be instantaneously reversed, even when it is running fast. It is adapted for steam propellers and for hoists, but may be used for any ordinary purpose as well. The space it occupies is very small, and all the moving parts are enclosed in the case. This engine, which we will illustrate in a future number, may be seen at work, every afternoon, at the National Iron Works, corner of Main and Howard.

## The Quartz Mines of Placer County.

The Duncan Hill mines, about two miles west of Auburn, are all doing well. At the Conrad mine, the main shaft is now down 180 ft., and drifts at this point run both east and west on the ledge have struck shoots of high-grade milling rock, with occasional rich pockets of specimen rock. A second shaft 800 ft. east of the above is down 80 ft. in fair milling rock. The best mill-run of the ore averaged \$32 per ton.

The Hunter mine on the north end of the hill, located and opened within the last six months, is prospecting well. The ledge is parallel to the Conrad ledge, and similar to it. A shaft has been sunk on the ledge which is three ft. thick, and 150 ft. of levels run to prospect the ore body. A portion of the rock taken out in opening the mine, some 50 tons, was milled as an experiment, and yielded \$15 per ton. In addition, several hundred dollars' worth of rich specimens for jewelry were picked out. Probably what will be the best mine the gold-bearing quartz district around Auburn has developed is the Ohio, or Gold Blossom mine, owned by Messrs. Craig & Fulweiler, of Auburn. It is situated on the western slope of Crater hill, about two miles west of Ophir. The location covers 1,800 ft. on an east and west ledge that can be traced by croppings for two miles. Both walls are granite, the ledge standing nearly vertical between them. In width the vein varies from 30 to 60 inches, and while carrying some free gold which is rarely coarse enough to be visible to the eye, is principally enriched by the high percentage of auriferous sulphurets that it carries. Assays of the rock run all the way from \$40 to \$1,930 per ton. A quantity of rock hand sorted so as to contain but a small quantity of sulphurets worked \$16 and upward per ton in free gold. The ledge having only been located this last summer but little work has been done toward developing the property. One permanent working shaft down 80 ft., and several prospecting shafts and drifts have, however, exposed an ore body of several tons of high-grade rock. The recent decision of the Land Commissioner throwing open to mineral location under the U. S. mining laws school sections of mineral land patented to the State, will give quite an impetus to quartz mining around Auburn, a section of such land on which are many ledges, some known to be valuable, being only a mile distant from the town.

Several quartz mines in Humboldt mining district, one and one half miles west of Damascus, have been worked on a small scale with very encouraging results during the past summer. One of these, the Pioneer, is opened by a tunnel 287 ft. long, which cuts the ledge at a depth of 300 ft.; the ledge at this point is four ft. thick, and high-grade milling rock. From the old workings at a less depth on the ledge, 1,200 tons of rock were milled, and yielded at the rate of \$20 per ton.

High up in the mountains about 15 miles west of the summit, and far down in the almost inaccessible Sailor canyon, is another ledge which bids fair to develop into a mine. This vein, which varies in thickness from 7 to 13 ft., and dips at an angle of 45° to the northeast, has been prospected at several points by short tunnels which tap the ledge at considerable depths. Averaged assays made on samples taken from all points on the ledge yet opened indicate that the ore will mill about \$15 per ton.

OWING to a scarcity of coal, caused by a strike of the Lancashire miners, several mills and foundries have been stopped, and distress among the working classes is apprehended.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

### Stirring Roasting Ores.

EDITORS PRESS:—In your issue of the 8th inst., you give an illustrated extract from Kustel's work on roasting, describing a new style of wheel roller, on which to work the hoe in stirring the ore in a reverberatory furnace. I devised, but did not make the same roller in Mexico, in 1866, and think well of the plan; but it is proper to remark, that unless the roller is placed in the middle of the thickness of this wall, it will greatly diminish the range of operation of the hoe, necessitating a corresponding reduction of the hearth area, every part of which must be accessible.

If a roller were attached on the front of such a frame as that shown in your diagram, it is easy to see that the lateral movement of the hoe would be restricted to a comparatively small angle, and if the furnace had been built to be used with the ordinary roller, a considerable portion of the hearth would be inaccessible by a hoe resting on the new roller so attached.

This difficulty may be obviated by using two of the new rollers, one at each end of the door-frame, instead of the one in the middle. It would only be necessary to change the hoe from one roller to the other occasionally.

If, however, instead of attaching the roller outside, as shown in your diagram, a hole were drilled in the iron frame, in the middle of the thickness of the wall, and the swivel pin of the roller inserted therein, the hoe would have the same range as if the usual roller bar were used.

There is no difficulty in drilling such a hole by means of a lever and ratchet drill, the only question being whether the thickness of the casting would be sufficient to give stability to the arrangement.

You appear to slightly misapprehend your author when you say, "a wheel, which allows the hoe to be directed to the required points, which is not the case with roller bars." If I recollect rightly, Mr. Kustel does not make the latter statement. The roller bars admit of as great a range of movement of the hoe as it is possible to attain with the wheel, greater if the latter be attached to the frame as suggested. The trouble with roller bars is, that when the hoe handle is pushed, or pulled, while resting obliquely on the roller, the action of the latter tends to carry the handle toward one end or the other of the door frame. This is a trifling difficulty, and may be obviated by using stationary steel bars, in place of the roller bars. Such bars must be greased, and even then, necessarily wears the handle more than do the rollers or wheels.

C. H. A.

[The assertion made by our correspondent with reference to the sentence which says, "a wheel, which allows the hoe to be directed to its required points, which is not the case with the roller bars," is incorrect. We did not misapprehend our author but quoted him correctly, as our correspondent will see if he looks on page 68, of the work in question. Mr. Kustel's idea was probably that the roller bar allowed an oblique movement to the handle, so that it would rub against the inner edge of the door.—Eds. Press.]

### The Chinese Treaties.

Omitting the preambles which contain only the formalities usual to such documents, the following are the full terms of the treaties lately signed by the representatives of the Government of the United States and China:

#### The Immigration Treaty.

ARTICLE 1. Whenever, in the opinion of the Government of the United States, the coming of Chinese laborers to the United States, or their residence therein, affects or threatens to affect the interests of that country, or to endanger the good order of any locality within the territory thereof, the Government of China agrees that the Government of the United States may regulate, limit or suspend such coming or residence, but may not absolutely prohibit it. The limitation or suspension shall be reasonable, and shall apply only to Chinese who may go to the United States as laborers, other classes not being included in the limitation. Legislation in regard to Chinese laborers will be of such a character only as is necessary to enforce the regulation, limitation or suspension of immigration, and immigrants shall not be subject to personal maltreatment or abuse.

ART. 2. Chinese subjects, whether proceeding to the United States as traders, students or merchants, or from curiosity, together with their body and household servants, and Chinese laborers who are now in the United States, shall be allowed to go and come of their own free will and accord, and shall be accorded all the rights, privileges, immunities and exemptions which are accorded to the citizens and subjects of the most favored nations.

ART. 3. If the Chinese laborers, or Chinese of any other class, now either permanently or temporarily residing in the territory of the United States, meet with ill treatment at the hands of any other persons, the Government of

the United States will exert all its power to devise measures for their protection, and secure to them the same rights, privileges, immunities and exemptions as may be enjoyed by the citizens or subjects of the most favored nations, and to which they are entitled by treaty.

ART. 4. The high contracting powers, having agreed upon the foregoing Articles, whenever the Government of the United States shall adopt legislative measures in accordance therewith, such measures will be communicated to the government of China, and if the measures, as effected, are found to work hardship upon the subjects of China, the Chinese Minister at Washington may bring the matter to the notice of the Secretary of State of the United States, who will consider the subject with him, and the Chinese Foreign Office may also bring the matter to the notice of the U. S. Minister at Hongkong and consider the subject with him, to the end that mutual and unequal benefit may result. In faith whereof, the respective Plenipotentiaries have signed and sealed the foregoing at Peking, in English and Chinese, there being three originals of each text of even tenor and date, the ratification of which shall be exchanged at Peking within one year from the date of its execution.

Done at Peking this 17th day of November, in the year of our Lord, 1880, Kuang Hsi, sixth year, 10th moon, 15th day. Signed and sealed by the Commissioners of both Governments.

#### The Commercial Treaty.

ART. 1. The Government of the United States and China, recognizing the benefits of their past commercial relations, and in order to still further promote such relations between the citizens and subjects of the two Powers, mutually agree to give the most careful and favorable attention to the representations of either as to such special extension of commercial intercourse as either may desire.

ART. 2. The Governments of China and of the United States mutually agree and undertake that Chinese subjects shall not be permitted to import opium into any of the ports of the United States, and citizens of the United States shall not be permitted to import opium into any of the open ports of China, or to transport from one open port to any other open port, or to buy and sell opium in any of the open ports of China. This absolute prohibition, which extends to vessels owned by the citizens or subjects of either Power, to foreign vessels employed by them, or to vessels owned by the citizens or subjects of either Power, and employed by other persons for transportation of opium, shall be enforced by appropriate legislation on the part of China and the United States, and the benefits of the favored claims in existing treaties shall not be claimed by the citizens or subjects of either Power as against the provisions of this article.

ART. 3. His Imperial Majesty, the Emperor of China, hereby promises and agrees that no other kind or higher rate of tonnage dues or duties for imports or exports or coastwise trade shall be imposed or levied in the open ports of China upon vessels wholly belonging to citizens of the United States, or upon the produce, manufactures or merchandise imported on the same from the United States or from any foreign country, or upon the produce, manufactures or merchandise exported in the same to the United States, or to any foreign country, or transported in the same from one open port of China to another, than are imposed or levied on vessels or cargoes of any other nation, or on those of Chinese subjects. The United States hereby promises and agrees that no other kind or higher rate of tonnage duties or dues for imports shall be imposed or levied in the ports of the United States upon vessels wholly belonging to the subjects of his Imperial Majesty, coming either directly or by way of any foreign port from any of the ports of China which are open to foreign trade to the ports of the United States, or returning therefrom either directly or by way of any foreign port to any of the open ports of China, or upon the produce, manufactures or merchandise imported in the same from China, or from any foreign country, than are imposed or levied on vessels of other nations which make no discrimination against the United States in tonnage dues or duties on imports, exports or coastwise trade, or than are imposed or levied on vessels and cargoes of citizens of the United States.

ART. 4. When controversies arise in the Chinese Empire between citizens of the United States and subjects of his Imperial Majesty, which need to be examined and decided by the public officers of the two nations, it is agreed between the Governments of the United States and China that such cases shall be tried by the proper official of the nationality of the defendant. The properly authorized official of the plaintiff's nationality shall be freely permitted to attend the trial, and shall be treated with the courtesy due to his position. He shall be granted all proper facilities for watching the proceedings in the interest of justice, and if he so desire he shall have the right to be present and to examine and to cross-examine witnesses. If he is dissatisfied with the proceedings he shall be permitted to protest against them in debate. The law administered will be the law of the nationality of the officer trying the case.

In faith whereof, the respective plenipotentiaries have signed and sealed the foregoing, at Peking, in English and Chinese, there being three originals of each text, of even tenor and date, the ratification of which shall be exchanged at Peking within one year from the date of its execution.

Done at Peking, this 17th day of November, in the year of our Lord 1880, Kuang Hsi sixth year, tenth moon, fifteenth day. Signed and sealed by the Commissioners.

### California to Arizona by Wagon.

We have received several letters from Californians inquiring as to the best and most direct wagon route from California to this place. As it would take us some time to answer such separate correspondent, and give a satisfactory reply, we have concluded to embody the information in an article for publication, and take Stockton, near the center of California, for the starting point. The information is correct in every particular, as we condense it from the diary of Mr. W. T. Woods, who, with his family, made the trip from Marysville last spring, an account of which appeared in these columns:

From Stockton you go to French Camp, thence to Barnsbyville, on the Stanislaus river, thence to Modesto, where you cross the Tuolumne river and continue to Ceres; then to Turlock, on the railroad; thence to Hoptown, on the Merced river, about 75 miles from Stockton; thence to Cox's ferry, and cross the Merced river, and thence to Merced City; from thence to Cottonwood creek, Berenda station, Fresno river, which you cross and continue to Borden, on the San Joaquin river, and thence to Fresno City, and from thence to Fowlers; thence to Kings river and Visalia, where you take the Farmersville road and go to Pottersville, about 200 miles from Stockton. Thence to Mandala Plana, on the Tulare river; thence to Deer creek and cross White river; where you cross a 30-mile desert to Kern valley; thence to Bakersfield and Sumner, the railroad station; thence via Tehachapi route to Caliente; thence to the old and new towns of Tehachapi, and thence to Cameron; and thence to Mohave and Buckhorn springs, and on to the Mohave river. From the Mohave river to Point of Rocks; thence to Cottonwood and Grapevine, which is about 425 miles from Stockton. From thence down the river to Fish Pond; thence to Camp Cody; thence to the Caves, on the Mohave river; thence to Soda lake; thence to Merrill springs; thence to Government Holes; thence to Pahute springs; thence up to the summit and down, passing through Lincoln county, Nevada, and to the Colorado river, opposite Fort Mohave, where you cross the river and continue up to Alexandria, via Hardyville; from thence through Union canyon to the Toll gate, which is some 625 miles from the place of starting. From thence you go to Beal springs; thence to Hualapai springs; thence to the Tanks, where you have the Prescott road, and turn down the Sandy, pass by the "Stinking wells," and on down the Sandy to Omerra ranch and the Santa Margarita; thence to Grapevine, and thence to Date creek. From this place to Wickenburg, and thence to Seymour; next to Agua Fria, and thence to Phoenix, which is about 850 miles from Stockton, and it will take from 35 to 40 days to make the trip, where you will find the editor of the *Expositor* and many others who will be glad to show you our country and tell you of its wonderful mineral wealth.—*Territorial Expositor*.

### Snow Slides in Utah.

The *Tribune's* correspondent at Alta, Utah, furnishes the following particulars of the great storm and disastrous snowslides at that place last night: The storm here to-day has been the most severe witnessed in the mountains, great sheets of snow falling, so that it was impossible to venture beyond one's door, and slides were frequent. The first occurred at 10 o'clock, and started nearly at the top of the mountain in the vicinity of the Rough and Ready mine. It came crashing down the mountain side, carrying away the flag staff, one house, 300 or 400 ft. of railroad snow sheds and telegraph poles, thence across the flat and creek and up the opposite mountains. The concussion was so great as to break open the doors and windows of houses in the vicinity. At 12 o'clock another slide broke up Davenport gulch, and passed over the Imperial and Victoria boarding house in which were two men. The house was covered to the depth of 20 ft., and the men were 10 hours digging their way out. This slide continued down the mountain, and swept the boarding house of the Grizzly mine. Here was the most awful disaster of the terrible night. In this house was Mrs. Jonathan Harkins and four children, three boys, and a girl about 12 years; also Charles Symons, Robert Howcorth and Evan Morris. Symons and the oldest boy of Mrs. Harkins were sleeping upstairs, and were thrown out of the house unhurt, but all the rest were buried in the slide. The alarm was given by the survivors, and the miners at the City of Rocks began the work of excavation, joined by miners of the Prince of Wales and others from the Alta. The work continued till 10 o'clock this (Friday) morning, when the two little boys were taken out alive, one injured in the back. Mrs. Harkins and her daughter Jennie were discovered dead, but the bodies of Howcorth and Morris still remain in the slide. Another slide occurred at the Toledo mine, carrying away a compressor and hoarding house. Charles Borbridge and Frank Laporte were in the house at the time. Their bodies were recovered this morning by a rescuing party.

There is no doubt that more lives have been lost and more property destroyed, but the above is all that is known at present.

### Gold in Alaska.

At last the gold and silver mines of Alaska are becoming more known and their value demonstrated. We have always contended that in this unknown land would be found some of the richest mineral deposits on this continent; and if half the news is true which was brought by the last steamer from Sitka, our prophecy is already more than fulfilled. It is stated that richer placer diggings have been discovered at Takou, 20 miles long by 8 wide, and that good pay-dirt is the result. No sufficient prospect has been made to speak definitely of their value, but those who are there are fully satisfied with results, and it is expected there will be a great rush there during the coming spring.

On the mainland, outside the Coast Range, between Auk and Schneck, the most extraordinary and wonderful discovery has been made of gold, silver and galena. These assays go into the thousands—one lot of ore showing \$3,000 to this ton. This gold can be seen with the naked eye, and can be felt by a blind man. A new mining district has been formed and named after Harris, the discoverer. He has taken up a town site of 160 acres of land, situated on the coast. If these stories are true, next summer will behold there one of the most flourishing mining camps on the Pacific coast. A few men are now there at work—old Alaska mountaineers, inured to the hardships and cold of that peculiar climate.

Our source of information is from the most undoubted authority. The steamer *Favorite* has gone to the new diggings with George E. Pitz, the assayer and mining engineer, whose party of prospectors are amongst the first locators of the new mines. Several of the most experienced miners who are wintering at Sitka have also gone in the *Favorite* to ascertain the truth of the report. We have, ourselves, seen some of the rock, and it is fabulously rich in appearance. Still, until further advices are received, we would caution the public against putting too much reliance in the statements made. There will be plenty of time between this and spring to ascertain the truth. The season of the year is inolement; the winter even here has set in with unusual severity, and at Takou it is rigorous, hoisterous and very cold. An unprecedented rush at this season might result in untold hardships and disasters. It is better to wait until the spring opens, when, if these marvelous stories are substantiated, we shall look for an exodus equal to the Fraser river excitement in 1857.

A number of valuable lodes of silver and argentiferous galena have also been discovered, located and secured, north of Cross Sound, and merged into a company composed of experienced and go-ahead men. Some of the rock—an average lot—has been assayed, and realizes \$180 in silver and \$40 in lead to the ton. Specimens of this ore can be seen at the office of Major Morris, special agent. Samples have also been sent to the mining magnates of Borealis building, New York. One mine of this kind only is needed to make all parties connected therewith independently rich. Major M. P. Berry, late Collector at Sitka, is President of the company. He is an old miner, and a man of great caution and experience.

We take pleasure in noticing the remarks contained in the recent report of the Secretary of the Navy, regarding the establishment of some form of civil government in Alaska, and also congratulating our neighbors on the decided stand taken by the President in his last message, wherein he recommends this to Congress, fully endorsing the report of Secretary Thompson in every particular. Once established the fact of productive mines in Alaska, and the question of population is settled. It will not be long before she will have as many white people there as there are in the State of Nevada. We shall keep our readers advised as we hear from that section.—*Puget Sound Argus*

COLLEGE OF PHARMACY.—The twelfth annual meeting of the California Pharmaceutical Society and College of Pharmacy was held at the hall of the Academy of Sciences on Thursday evening of last week. The following officers were elected to serve the ensuing year: President, Emlen Painter, Ph. G.; First Vice-President, S. A. McDonnell, Ph. G.; Second Vice-President, J. H. Dawson, Ph. G.; Corresponding and Recording Secretary, E. H. Schreck, Ph. G.; Treasurer, Wm. J. Bryan; Librarian and Curator, Ph. L. Vreeland, Ph. G.; Editor, Wm. M. Searly; Board of Directors—F. C. Keil, John Calvert, A. L. Lengfield, Wm. J. Bryan, E. A. Schreck, Emlen Painter and S. A. McDonnell. Reports were submitted by the several committees and outgoing officers. The Committee on Legislation presented a Pharmacy Act, which, with some changes, was accepted and directed to be brought before the Legislature without delay. Owing to the lateness of the hour, the reading of papers and answers to queries was postponed to an adjourned meeting, to take place one month hence.

POCKET MINES.—"Do you happen to know anything about the Flynight mine? I put a couple of thousand into it eight months ago, and I have never heard a word about it since." "Guess it was a pocket mine." "Pocket mine, what's that?" "Why, the getters up of a mine of this class put the money in their pockets, and the stockholders pocket the loss."

THE ELECTRIC LIGHT IN LONG TUNNELS.—It is proposed to light the tunnel of St. Gothard, nearly nine miles in length, by electric lamps.

## MECHANICAL PROGRESS.

## Strength in Machine Tools.

Mr. Charles T. Porter, in his paper before the American Society of Mechanical Engineers at its last meeting, offers the following valuable suggestions:

As one subject of primary importance, I wish to present that of strength in machine tools. Truth of construction, facility of operation and range of application are all, in one sense, subordinate to this fundamental quality of strength; for they are in a greater or less degree impaired where adequate strength is not provided.

But what is adequate strength? On this point there exists among the makers and users of tools a wide diversity of opinion. And on examination it will be found that this diversity coincides with the diversity in mechanical sensibility. As the mechanical sense is developed, there arises in just the same degree the demand for greater strength in machine tools.

To the mechanic who has never formed a notion of division of an inch more exact than "a bare 32d," any tool, if it can in any way be kept from chattering, is as good as another, and better if it is cheaper.

To those, on the other hand, who demand in every piece, as it comes from the tool, the closest approach to perfection, both in form and finish, a degree of strength in the tool appears, and is demonstrated, to be indispensable, that to the former class seems as absurd as the results attained by means of it appear incredible.

In this country, as indeed all over the world, the standard of mechanical truth has been very low. It is here, however, as everywhere, rapidly rising. The multitude are being educated up to the standard of the few. In this work members of this association have borne and now bear an honorable part. Just in the degree that the standard of mechanical excellence is raised must the demand become more general for greater strength in machine tools, indispensable to its attainment.

But what is the standard of strength? The anvil affords perhaps its best illustration. It is a strength enormously beyond that which prevents a tendency to chatter, a strength that under even the heaviest labor prevents the least vibration of any part of the tool, or any indication of effort, more than that the object being cut were a mass of butter.

It will be seen that this absolute solidity in machine tools, while truth cannot be attained without it, enables also mechanical operations generally to be performed with far greater expedition, and the subsequent work of the finisher to be in any case much diminished, and often dispensed with entirely.

We are enabled, in most cases, to come at once to the form desired, whatever may be the quality of material to be removed, and always to finish the surface with a degree of truth and polish otherwise unattainable, dispensing, in a great measure, with the use of that abomination, the file.

Now, with this standard in our mind, we look over the face of the land, and behold it covered with rubbish.

It is curious to observe how ingenious tool-makers have generally been in trying to avoid this quality of strength, and how deceptive an appearance in this respect many tools present.

It is interesting to note how little this quality of solidity adds to the cost of casting. The addition is merely so much more pig-iron, and really not that, because in the stove plate style the forms are more complicated, the patterns more expensive and frail, and the cost of molding is greater. But what signifies even a considerable increase in the first cost of a tool that in daily use is to perform the work of many, and is to place its possessor on a mechanical eminence?

It is not the purpose of this paper to enter into details, interesting and important as they are, but to draw attention to the subject in a general way. The improvement observed quite recently in this respect, as well as in other points of tool construction, is highly gratifying, and encourages the expectation of still further and more general progress.

## The Ship of the Future.

In attempting to replace wood with iron in the building of heavy ships many difficulties have been encountered, and resort was finally had to steel; but still the results were not what was expected. Many, even of the best plates produced, failed to pass the requisite inspection, and, in numerous cases, when they did pass, and were put into actual service in the hulls of vessels, cracked and gave out in most inexplicable ways. Seams would sometimes open up the whole length of a plate, the fracture of which showed no sufficient cause for such weakness. But still the steel manufacturers of Great Britain, though greatly discouraged, would not give it up. They called to their assistance the best scientific talent of the world to study out the problem, to determine where the difficulty existed, and to devise a way to remedy it. England's supremacy on the ocean depended upon the successful solution of the problem.

The failures were many; the experiments were tedious and costly; but success seems to have finally crowned their efforts, and we may now safely predict that the ships of the future will be constructed of steel; that they will be far more durable, much cheaper in the end, able to carry more freight in proportion to size, be safer from the ordinary danger of the seas, whether from foundering, stranding on a lee-shore, or striking upon sunken rocks, and finally that they will secure a material addition to the profits of a voyage over ships of either iron or wood. Owing to the improved processes introduced into the manufacture of iron and its conversion into steel, plates are now made which will endure a tension strength of from 26 to 30 tons per inch, and the ductility of which satisfies all the bending and punching tests which the most rigid inspector can prescribe. Ships built in English dock yards of such improved steel are already afloat, and giving the most entire satisfaction. The Cunard Co. are now building a large steamer of this improved steel. The building of steel steamships is no longer experimental. And notwithstanding less than five years ago British steel manufacturers were on the point of abandoning in despair their efforts in this direction, steel is to-day victorious, and even the British Admiralty accepts the fact.—*Californian for February.*

## Material for Boilers.

A writer in the *Paper Trade Journal* writes, in regard to the material for boilers, as follows: "Cast iron boilers are all, of necessity, of the sectional type. Their advantages over wrought iron are that cast iron is a better conductor, is more durable, resists corrosion better, being proof against the chemical action of feed water and gases, does not blister, is less easily strained by unequal temperature, requires no braces to resist high pressure, is cheap, is easily duplicated and mended parts are as strong as new. The objections are that it is treacherous at high or unequal temperatures, has hidden flaws that give no warning of weakness, they are more difficult to get uniform in strength, and boilers made of it prime and are deficient in circulation. The nearer circular the parts of a cast iron boiler so much the better."

Now, let us see what Mr. Shock says in his new work: "Its first low cost and the ease with which it can be worked give it great advantages for such purposes"—speaking of grate bars, ash pans, furnace and up-take doors, etc.—but Mr. Shock confines its use to boiler appendages: "But the uncertain strength caused by defective moulding, its brittleness and low tensile strength renders it unfit for extensive use for parts of boilers proper. Its unyielding nature unfits it especially for parts subjected to unequal expansion from differences of temperature. Several kinds of modern sectional boilers consist, however, almost entirely of small cast iron spheres or tubes."

Upon the above the editor of the *Boston Journal of Commerce* writes as follows:

The party who wrote the first paragraph had evidently never read Shock's book, and, it is more than likely, had no practical experience either in building or managing boilers. He does not say that a cast iron boiler never was built, or never can be, without a liberal use of wrought iron to hold it together, that they are always giving out somewhere, that a little misfit in workmanship is a continual annoyance, a nuisance and often a bill of expense. He does not say that the spheres are sometimes cast half an inch thick upon one side and three-sixteenths upon another, and from that down to one-sixteenth. But better than all the rest is Joseph Harrison, Jr.'s remark, when he decided to close up his cast iron boiler works, and made the announcement: "Cast iron boilers, gentlemen, are a failure; buy your boilers somewhere else"; and this after an expenditure of probably \$300,000, if not more. At the same time, people must write something for the papers, and the more they mislead the public the more valuable, in their idea, the articles are. The same writer also writes of wrought iron and mild steel boilers, condensing his mild steel boilers into six lines, stating that it is more difficult to work than iron, more apt to be brittle, etc. This man evidently has not traveled among Boston boiler makers, and we presume if he would get into the neighborhood of Cleveland, Ohio, he will find men who will laugh at him for his egotistical complacency. Homogeneous iron, or, as it is called, mild plate steel, makes, to-day, the best boiler in the world; and it must be understood first of all that the quality is only produced by some two or three concerns in the United States at the moment, and when we say best boiler in the world, we mean of steel, made by honest makers, whose determination is to get high tensile strength, as well as the full amount of ductility, both of which are regular productions, and the few mills who are making the proper quality of steel have orders entered on their books for months ahead of their full production.

A MIGHTY LEVER.—About the first of December last the mightiest lever in the world was completed for the Royal gun factories at Woolwich. Its manufacture occupied about four years. The girder radiates on a central pile, with the outer extremity of the arm supported upon a wheeled tower traveling on a circular railway, which incloses about a quarter of an acre of ground. In the construction of the machine 1,800 tons of iron and three tons of brass were used. The crane is capable of lifting four 100-ton guns at once, and was constructed with a view of dealing with specimens of ordnance of much greater weight than those mentioned.

## SCIENTIFIC PROGRESS.

## Jupiter and His Spots.

The most attractive object in the evening sky just at this time is the giant planet Jupiter. The markings upon his belts have for some time been attracting the universal attention of astronomers and amateur observers. Always enigmatical, this planet has, since the appearance of the great red spot in its southern hemisphere, become still more perplexing to the astronomer. It was at first supposed that this prominent object would form a ready means of determining the true period of the planet's revolution, but that result has not been realized. On the contrary, if anything, it has rendered that problem still more doubtful.

Soon after the "great" spot was discovered, two or three other smaller, but still plainly discernible and permanent spots were observed near by the large one. Close and continued observations of these several spots during the past summer, according to the published reports of Prof. Barnard, of Nashville, Tennessee, have revealed the most singular fact yet developed, that these spots are not identical in their revolutions, as would be the case if they were absolutely fixed to the central nucleus of the planet. On the 25th of last July, the center of one of the small spots preceded the center of the large spot by one hour and 35 minutes. On the 22d of November the center of the small spot preceded the center of the large one by three hours and 17 minutes. The large spot had thus apparently moved backward one hour and 42 minutes between July 25th and November 22d, showing a daily difference of rotation of 0.439 minutes per day. At this rate the small spot would gain an entire revolution in about 23 months. There is quite a difference in the motion of all the spots to be seen on the planet's disk.

In a letter to *Science*, dated November 29th, Prof. Barnard writes in regard to this planet as follows: "The region occupied by the equatorial belt is subject to constant and quite rapid change, being filled at times with the most delicate soft, plummy forms. Brilliant white spots are not infrequent in this zone. . . . All the objects in the equatorial zone move with a very great velocity in the direction of rotation, but invariably in a contrary direction to that pursued by the (great) red spot, which is really the only object on the planet which has a backward motion. Indeed, it would not be a bad comparison to compare the red spot to a mighty city built on the shore of a vast and swiftly flowing river, which is constantly being filled with drift, and an occasional glistening mass of ice tearing its way past the city with a velocity of not less than 6,000 miles a day. In such a comparison the city would be as great an area as three-fourths of our entire earth, and the river fully 16,000 miles in breadth."

Jupiter passed its perihelion on the 25th of September last. That great planet then reached its nearest point to the sun, and was also, at the same time, within a few days of its nearest point to the earth; so that the rhinoceros of its perihelion and its nearest approach to the earth and sun has already passed. At its perihelion, Jupiter is 46,000,000 miles nearer the sun than at its aphelion. The difference between the two intervals of distance is about half the entire average distance of the earth from the sun. Yet Jupiter, at its nearest approach, is 450,000,000 miles from the great central luminary. Nearly 12 years must elapse before Jupiter will be as favorably situated for observation as he is at this time.

With the exception of Saturn, nothing in the heavens affords a more interesting subject for study than Jupiter and his moons. It is delightful to watch those four little diamond-points as they move in rapid succession around the parent body, passing now as dark spots across his disk, then behind and eclipsed by it. A glimpse of its moons may be had even through a good opera-glass, and in an exceptionally clear atmosphere, at a considerable elevation above the sea, they have been seen by the unaided eye. The large spot may be seen with a five-inch telescope. When this spot is just beginning to appear at the eastern portion of Jupiter's disk, so rapid is the rotation of that planet that in a little over two hours it will have reached the center, and in less than five it will again be out of sight, having passed around its western limb. The size of this spot varies somewhat in length, but is quite constant in breadth. Its average length is about 23,000 miles, by a breadth, in its widest portion, of 6,900 miles—equal in area to about three-quarters of the entire surface of the earth. Its color is a light red. Jupiter turns on its axis in a little less than 10 hours, so that an observer on its equator would be hurled around at a rate of 500 miles a minute instead of the comparatively slow progress of 17 miles that marks the rate of the earth's revolution at its equator.—*Californian for February.*

ANOTHER COMET.—The Smithsonian Institution has received from the Astronomer Royal, of England, the announcement of the discovery by Cooper, on December 21st, at nine o'clock, P. M., Greenwich mean time, of a bright comet in 1 hour 5 minutes right ascension and 6° north declination, which, at seven o'clock, December 25th, was in 1 hour 29 minutes right ascension and 2° north declination.

## The Coloring Matter of Flowers.

Hitherto it has generally been supposed that the various colors observable in flowers and leaves were due to different kinds of matter which enter into the composition of the leaves and petals—each color being a different chemical combination, and so constituted that the substance of no one color could in any natural way be made to take up another color. Recently, however, Prof. Schuetzler read an interesting paper upon this subject before the Vadois Society of Natural Sciences, in which that gentleman details a series of experiments recently made by him, which present this interesting subject in an entirely new light. The professor showed by experiment that when the color of a flower has been extracted by macerating the flower in alcohol, one may, by adding different acids or alkalis, obtain from that one color all the various other colors which plants exhibit. Take, for example, a peony: when macerated in alcohol, a violet-red liquid is obtained. Now, if some oxalate of potassa be added to the fluid, it becomes pure red; if soda be added, it will appear violet, blue or green, according to the proportion of soda employed. If a green color is produced, it will appear red by transmitted light, just as a solution of chlorophyll does.

It was held by the professor that these changes of color might quite as well be obtained naturally in the plant by giving it the proper plant nourishment, since in all plants acid or alkaline matters always exist. It was furthermore stated that the change from green to red in "autumn leaves" is due to the action of the tannin, which is developed in the leaves. Hence, without affirming it absolutely, the professor believes that there is in plants and flowers only one coloring matter—chlorophyll—which, being modified by certain agents, furnishes all the various tints that flowers and leaves exhibit. As for white flowers, said the professor, it is well known that their cells are filled with a colorless fluid, opacity being due to the air contained in their numerous cells. This may be proved by placing the petals of such flowers under the receiver of an air-pump, when they are seen to lose their opacity, and become transparent as the air escapes. If the deduction which the professor makes from his experiments are correct, a wide and most interesting field of experiment is hereby opened up to the scientific florist.—*Californian for February.*

## A Scientific Application of the Photophone.

Prof. Bell's newly invented instrument for the reproduction of sound through the agency of a beam of light, is being applied to the study of this solar surface. While Mr. Bell was in Paris, recently, M. Janssen, having informed him that he had detected movements of prodigious rapidity in the photospheric matter, Mr. Bell suggested the idea of employing his photophone for the reproduction, at the earth's surface, of the sounds which must necessarily accompany such movements. M. Janssen approved the idea, and requested Mr. Bell to attempt its realization at the Mendon Observatory, where all necessary instruments and facilities would be placed at his disposal. The first attempt was made on the 30th of October, but the phenomena were not sufficiently decided to be regarded as successful; yet Mr. Bell hopes to succeed by continued study and perseverance. Experiments will, therefore, be continued. M. Janssen holds that the idea is one of so much importance that its author, Mr. Bell, should be fully recognized in his priority of its conception.

## The Sun Recording Its Own Brilliancy.

An instrument for recording the intensity and duration of sunshine was devised as early as 1856, by Mr. J. F. Campbell, of England; but it has never, until quite recently, been made thoroughly practical and reliable. Still, even in its imperfect form, it has been made to do duty for several years at Greenwich and Kew, and several private observatories in England. The instrument consists of an ordinary "burning-glass," or lens, the focus of which is made to keep its place on a constantly moving strip of paper. The manifest difficulty of properly adjusting the complicated movements involved in such a work has only quite recently been fully overcome by the genius and patience of Prof. Stokes of England, whose improved instrument has recently been set up in some 30 stations in the British Isles. We are not advised as to whether the instrument has been introduced into this country; but if it will do what it is credited with, it must soon become a part of the ordinary equipment of every meteorological station in the world; for by it we may, in time, obtain a sufficient record of a meteorological element of primary importance in its relation to agriculture and to the public health, but which has heretofore been very imperfectly registered.

CALORIFIC VALUE OF HYDROGEN.—From a given weight of hydrogen gas under combustion a greater quantity of heat can be generated than from an equal weight of any other known combustible. A pound of pure carbon will evaporate 12½ lbs. of water and convert it into steam of 15 lbs. pressure on the square inch. One lb. of good Pennsylvania anthracite is capable of raising nine and one-half lbs. of water at 211° F. into steam.

The Porter mine has been dismantled - the 12 stamp mill

and the engine having been moved over to the Meredith mine last week. Mr. Denner will add 4 more stamps to the mill.

We notice in the New York Sun, of Jan. 1st, that Prof. Edison and his head chemist, Prof. Heid, are making preparations to start for this city to meet Major McLaughlin, his mining engineer.

This mining mine is all ready to commence work. Their mill, a Folsom pulverizer, has been set up, and all the owners are waiting for it is the agent of the mill to come up and inspect it before they start up.

In the Oronine they are still running the tunnel. It has been driven in 710 ft through solid granite, and in running that distance have cut through 4 fine ledges. In a short time they will prospect them.

They are waiting on the *Roy Stone*, but for Mathematics to bring up a new casing from Sacramento. The old casing is not satisfactory to himself, and he wishes to use some changes in it before making a trial.

The Treadwell mine, 2 1/2 miles above Lovelock, is developing very rich ore. Although the vein is quite small, they have got out over 12 tons of quartz. The mine was bonded, last year, to a San Francisco company, who have lately renewed the bond.

**CALAVERAS.**

**EUREKA HYDRAULIC.**—Calaveras Chronicle, Jan. 15: Work has been prosecuted without interruption for some time in this claim, in fact ever since sufficient water was obtainable. There is no let up to the work. The 2 hydraulic pipes are firing right at the immense bank day after day. Within the last 3 or 4 weeks a circular excavation has been made in the hill over 200 ft in diameter, the bank being at least 100 ft in height. To supply the claim with water there is about 9,000 ft of pipe used, leading from 2 large ditches. The gravel runs off very rapidly through the 1,500 ft of flume which dumps the tailings into the Calaveras river. Everything is in first-rate working order, and with the present prospect of an abundance of water during the season, under the experienced management of the Cook Bros., proprietors, the Eureka will make a good report.

**EL DORADO.**

**FISHBURN.**—Mountain Democrat, Jan. 15: The Cal. W. & M. Co. has completed the laying of the 3,500 ft of 15-inch main pipe, and the water has been running since it was turned on during the past week. Its working gives the utmost satisfaction. The pipe delivers 220 inches, with a loss of less than 2 inches from leakage. With an assurance of a constant supply of water, the North Star, Bower and Munz mines, owned by Eastern capitalists, will now be energetically worked. The Greenwood seam held promises, at no distant day, to be one of the most prosperous mining camps in the State.

We were over to Will Collins' team diggers, the other day, and, judging from the small amount of work which has been done and the amount of gold taken out, he has a good paying mine.

A. J. WILSON, who came down from Kentucky flat, up to the Middle Fork of the American, on Thursday, informs us that a land slide took place at Oliver's mine, on Big bar, the other day, which carried with it the boarding-house, tools, etc., into the river. Mr. Wilson brought down specimens of mineral land productions from his mining claim, which excel anything we have seen for some time.

**INYO.**

**SALE OF ORE.**—Inyo Independent, Jan. 15: The ore now on the dump of the Ygnacio mine at Cerro Gordo has been sold to the Owens Lake mill and mining company, and the work of sacking and hauling the ore to the new mill at Keeler City will commence in a few days. We presume the mill will start up in a short time and make its first run on Ygnacio ore.

**A NEW DISCOVERY.**—On the east side of Mazurka canyon, and directly opposite Independence, there is an immense ledge cropping out. This ledge is in plain sight from town, and has been traveled over by prospectors since the first discovery. The ledge lies between limestone and granite, and crops out for a distance of 3 miles, showing dark red matter colored by iron oxide. Messrs. Woodhull & Phillips, having long been satisfied that this was the croppings of argenteous lead ores, lately made a careful examination of the ground, and they have been rewarded by finding the existence of large ore bodies near the surface. A number of samples have been assayed, showing ore carrying silver from \$25 to \$31, and gold from \$3 to \$8 per ton. The average of 42 lead assays was also found. Six claims have been located. But little prospecting has been done; however, enough is shown to prove that there is inexhaustible quantities of smelting ore under the croppings of this big ledge.

**MARIPOSA.**

**OPENING AN OLD MINE.**—Mariposa Gazette, Jan. 15: George Chittenden, owner of the old Grimsaw quartz mine, lying contiguous to the stage and wagon road, about 4 miles north of Hornitos, has commenced sinking a shaft and opening up this mine, which has lain dormant for a number of years. Considerable prospecting was done formerly upon the outcroppings of the vein, from which was taken a large amount of rich rock and ground in arrastras; at which time the mine was considered very valuable and held at a very high figure. The chances are favorable to this mine as being one of the best in the Hornitos district.

**NEVADA.**

**FOUND THE CHANNEL.**—Nevada Transcript, Jan. 15: Some very encouraging developments have been made during the past few days at the True Blue claim, owned by Messrs. Wellington, Robinson & Stevens, and situated about 4 miles north of this city. The incline has been opened into blue gravel, indicating the presence of the dead river channel for which the company have so long been engaged in running and sinking. Water is coming in rapidly, and Messrs. Robinson & Wellington went up to the property yesterday to decide on what steps they should take in the way of providing for future operations. It is believed the erection of machinery will be found necessary.

**OPENING A NEW MINE.**—Nevada Transcript, Jan. 15: D. T. Hughes arrived from the hay Sunday evening, and yesterday morning he went to Blue Tent to begin the development of his hydraulic claim there, formerly known as the Shellenberger ground. The property is generally conceded to be a first-class one.

**CROSBY WORKS.**—Nevada Herald, Jan. 18: The Crosby sulphur works are running in full blast day and night. A large amount of sulphur from the Merrifield mine are being daily hauled there.

For several days past work has progressed smoothly at the Manzanita hydraulic diggings. No accident has occurred to interfere with the working of the mine.

**PLACER MINES.**—In this vicinity are running in full blast. Work at the Nevada City mine is progressing favorably. During the past few days workmen have been engaged in repairing the rock house.

**PLUMAS.**

**SOUTHERN EUREKA COX.**—Greenville Bulletin, Jan. 15: Everything is progressing steadily. Most of the machinery in the new mill is in place and the tramway nearly completed.

**INDIAN VALLEY.**—A day or two more will complete the new mill and the arrangement of the engine and machinery. In our next, we hope to give something of a description of the mine and its workings.

**OLD STRIKE.**—At this mine work is progressing as usual, the 24-stamp mill running constantly on good rock. There is continued improvement in the Kerr tunnel, indicating near approach to pay ore, also fine indications in the Mullen drift.

**CROSBY.**—Good sleighing has favored the hauling of ore to the mill of this company, so that it has been kept running with little interruption. The hauling works are fairly in running order and the Oarfield shaft is being rapidly put down to more thoroughly develop what is known to be rich country, as was shown by the former lower workings on this property.

**BLACK HAWK.**—Near the head waters of Black Hawk creek, not far from Butterly valley, Brown, Christenot &

Co. are putting in an 8-stamp mill, complete with concentrators, formerly known as the Stratton mill. It will be run by steam power, though water power can be used. They have a good ledge, and, in preparing the foundation for their mill, struck another rich ledge. The location is some 17 miles from here, and only a mile to the right of the road leading from here to Quincy.

**GREEN MOUNTAIN.**—During the past week there has been no cessation of work at either mill of this company, and they have been running constantly. The water has been going through the new pipe for upwards of 10 days, and has proved it to be substantial and well adapted to the use for which it is intended. The ditch now supplies an abundance of water for the use of both mills. The mine is rapidly getting in shape to supply the mills with less labor in the hauling of the ore, and by a general finishing up of the construction work of last season, the company expects to materially reduce the large and expensive force they have thus far had to employ. Development is in the face of the No. 5 tunnel continuing very encouraging, and the outlook is for a successful winter's work.

**AMERICAN VALLEY M. Co.**—Plumas National, Jan. 15: The machinery for this new mining operation, on the O'Neill ranch, is now running, and the shaft is down some 15 or 20 ft. Everything works nicely, and bedrock will be reached in 2 or 3 weeks. It is expected that pay gravel will soon be found after the shaft is down. It will probably be from 70 to 90 ft to bedrock.

**SIERRA.**

**ENCOURAGING.**—Mountain Messenger, Jan. 15: Blane Oravel M. Co., Sierra City, is now in with their tunnel 225 ft, running for bedrock. A second contract of 200 ft in rapid progress, and looking for bedrock in the face of the prospect well in gold and black sand. The last contract price was \$4 a ft, while the present is 75 cents less.

**PUEBLO.**—We were shown a rich quartz specimen by Jas. Beard last week, while at Sierra City, 2 1/2 lbs in weight, all sparkling with gold valued at \$8, extracted from the famed Phoenix ledge, believed by its owners to contain a bonanza of wealth.

**NORTH FORK.**—The North Fork claim, at Forest City, is being handsomely worked, and we understand, is paying handsomely. A tract of new ground has been opened. They are working a fair force of men and the prospects of the mine seem better than for many years.

**SIERRA CITY.**—Since the close of the holiday season times have not been over brisk, and all are now anxious concerning the mining prospects for the new year. The encouraging news of gravel being struck in the Bald Mountain extension tunnel, an ample and convincing proof that a channel courses up the ridge from Forest City to Gold Lake, is most cheering for eastern as well as for southern Sierra; and the stockholders of the Savage, Blue Gravel and numerous other companies on the supposed pay lead await with feverish impatience the outcome, and but a short time more will tell the story.

**CONTRACT LET.**—The Wilbourn Co. Co.'s gravel mine is located about 3 miles north of the South Fork, at Bassett's, leading toward Gold Lake. A contract has just been let to Wm. Wilbourn, a heavy stockholder, for \$90 a ft. This company owns 600 acres of ground. Further progress in the shaft was obstructed by large boulders during the recent severe storms, when snow fell to the depth of 8 ft; and as there was no blasting material nearer than Sierra City, a distance of 10 miles, work was necessarily discouraged and the boys were obliged to return homeward on snow-shoes. At the time sinking closed the shaft was in blue quartz gravel, a *face simile* of that in the Bald Mountain and Extension claims at Forest City. The prospect is very encouraging, and the tunnel will be in 100 ft beyond the shaft by the 1st of September.

**TUOLUMNE.**

**SONORA.**—Tuolumne Independent, Jan. 15: The Sonora mine is situated just inside of the town limits, and carries a very fine lode averaging 3 in. in size, and in vertical, contains enough for sinking to warrant it yielding \$10 to \$15 per ton. But the main valuable feature of this mine is the exceedingly rich sulphurets, which assay from \$500 to \$1,000 per ton, of which at present we should judge there are about 5%, and steadily increasing in quantity as they go down, with the same high grade. The shaft, No. 1, from which these sulphurets are being taken, is on the south end of the mine, is now sunk about 30 ft. Two shifts of miners are at work in the 24 hours. There is no water to prevent easy sinking; there are about 25 to 30 tons of ore on the dump. One rather peculiar feature of this mine is that the country rock on the foot wall proper of the vein, carries small seams or feeders that run into the vein at right angles, showing, when closely observed, free gold. The whole mine is intersected with cross-courses and feed-veins. Also the celebrated Divoll honanza vein crosses the Sonora vein at an obtuse angle, at about 200 ft from No. 1 shaft. The flattering record of a new claim is always recognized among the most pleasing items in a mining company. About one-half mile east from Groveland Messrs. Richards & Hunter have a claim that is paying well and are getting out rich hand-mortal rock. The rock pays from \$5 to \$70 per lb, which is taken from a small streak on the footwall side of the main vein, which is from 6 inches to 2 1/2 ft wide. The chute is 120 ft long, and they have taken out \$5,000 on one end and about the same amount on the other end. This is about the richest small vein, except the "Keith," below Jacksonville, in that part of the country.

A tin wash-up is expected at the Rough & Ready gravel mine, in Table mountain, after the present run. The company are going to work systematically by driving a series of cuts into the gravel. John Pereira, who owns a large tract on the channel line adjoining this claim, will shortly make preparations for opening the same. On the whole, the prospect for this mining in Table mountain is again coming to the front. From 5 to 10 and 12 the per day to the claim was frequently taken out, with an aggregate of 60 and 70 lbs per day, in the days of '55 and '56. There are miles of virgin channel extending from Shaw's flat to Knight's Ferry, untouched.

The mill on the Evans mine has started up and are now working a fine quality of ore. Owing to the extreme cold weather in that section it is almost impossible to save the fine particles of gold.

**NEVADA.**

**WASHOE DISTRICT.**

**SIERRA NEVADA.**—Enterprise, Jan. 16: During the past week the upraise from the 2500 level has been extended 20 ft; total height, 460 ft. The drift west to the 4th floor of the 2500 level from here has been extended 33 ft. Amount of ore raised during the week, 25 tons.

**UNION CON.**—On the 2500 level the joint Mexican upraise has been connected with the 2300 level; the joint Mexican west crosscut extended 22 ft. Drill hole No. 6 from No. 1 winze extended 200 ft; assays from a trace to \$10. During the week 33 tons of ore have been extracted from the 2500 level.

**CALIFORNIA.**—During the past week 800 tons of ore have been extracted and sent to the mills; average assay, \$13.95. On the 2300 level, in the joint Ophir east crosscut, are cutting out for a winze. The joint Con. Virginia east crosscut has been advanced 22 ft.

**MEXICAN.**—On the 2500 level the joint Ophir east winze has been sunk and timbered 12 ft, and a tank-pit is being cut out at the 2600 station; the west crosscut has been extended 20 ft.

**ORE.**—On the 2500 level the joint Mexican winze has been sunk 12 ft, and a tank station is being cut out at the 2600 level. On the 2300 level in the joint east crosscut are cutting out for a winze.

**CON. VIRGINIA.**—During the past week 747 tons of ore have been extracted; assay value, \$13.72. On the 2300 level the south drift has been extended 24 ft and the joint California east crosscut has been advanced 22 ft. During the week \$56,794.39 in bullion have been shipped.

**HALE & NORCROSS.**—The ruins of our hoisting works are being cleared away to make place for the building formerly used as the Con. Virginia hoisting works. The north lateral drift, 2400 level, has been extended 44 ft up to the time of the fire.

**UNION SHAFT.**—Shaft sunk and timbered 7 ft; repairing

drift at 1600 level, cutting out bob-pit at the 2200 and easing timber at the 2300 and 2400 stations.

**UTAH.**—During the past week the east drift on the 1350 level has been advanced 13 ft. On the 2150 level the east drift has been extended 23 ft.

**C. & S. SHAFT.**—The pump is being placed in position at the 2400 station.

**YELLOW JACKET.**—During the past week we have advanced the drift on the Sutor tunnel level 56 ft, making the present length of the same 104 ft from the switch. The ground has been quite hard and dry. The drift is 8 1/2 ft in size. The water in the shaft has risen on the 2300 level so as to cut off the air connection with the old workings.

**SILVER HILL.**—The winze has been sunk and timbered 12 ft; it has been very hard and short up to yesterday morning, since then softer and better working. In the bottom there are several streaks of fine quartz carrying metal and looking well. Work on the 300 level will be finished and ready for the water to-morrow.

**BRISTOL DISTRICT.**

**SHUT DOWN.**—Ward Reflex, Jan. 15: Jo. Lang, who has been stoping in Bristol for some time past, but returned to Ward a few days ago, confirms the report that everything has been shut down at Bristol. He is of the opinion that work will be resumed in 10 or 15 days.

**CHERRY CREEK DISTRICT.**

**NO WORK.**—Ward Reflex, Jan. 15: A letter has been received here from Cherry Creek, in which the writer says that but one of the miners who left here some time ago has found employment. The rest got there last week, but are too late. The streets are at times black with idle men. Those employed in the Star work in water up to their waste most of the time.

**EUREKA DISTRICT.**

**BULLWHACKER.**—Sentinel, Jan. 15: We went down, down—one step at a time—until the 75 level was reached. Here two men were stoping out ore from an upraise. Very little blasting was being done and still, within 48 hours, they had knocked down 10 or 12 tons of ore which would run from 40% to 60% lead and about 20 ounces in silver. Although the shaft was in a terrible condition when the recent work of repairing it was begun; it is now in splendid order for the work required. Upon the 130 level an immense amount of sulphurets has been found, and the large chambers of ore have been stoped out in the days when lead was of value, much of the same assaying as high as 75%. In 1873 the shaft was continued below these chambers about 100 ft, but careless and reckless workers after the riches of the 130 level have filled it up to that level with debris and waste rock. From one drift on this level a large body of ore has been followed to the north and downward until it is almost impossible to extract the same profitably. As a consequence, Mr. Kermann has ordered the old shaft cleaned out, and from the bottom will drift and stope up towards the known body. The working out of the waste and debris is well under way, 2 men being constantly employed thereat. When some 15 or 20 tons of ore are stoped down on the 75 level, it is at once hoisted and shipped to the Atlas furnace. The tracks from the shaft and to the waste and ore dumps are in good condition for rapid work. The ore wagons can be loaded from a platform, and the roads therefrom are of easy grade. It is the intention of the company to do some heavy work in the old Bullwhacker mine as soon as the shaft is cleaned out and the track in running order to the bottom thereof.

**GRANTSVILLE DISTRICT.**

**THE CENTRAL MINE.**—Bonanza, Jan. 15: Work in this mine is progressing steadily and with very encouraging results. The ore continues to improve in extent and richness as depth is attained. During the coming summer this mine will undoubtedly be added to the list of bullion producers.

**THE LIDA MINE.**—Among other mines of this place which show and go to prove this one of the largest mineral belts in the State, is the Lida mine, which, from its proximity to the Alexander, leads us to believe that it is situated on the same ledge or lode. This mine, in every place that has been opened, shows ore of the same character that is found in the upper levels of the Alexander. Developments are steadily progressing.

**ALEXANDER.**—The stopes in the Alexander have improved very much. Have connected the west stope in No. 5 with the 4th level, in which place nothing is to be seen but one mass of sulphurets ore. This stope is now wonderful, showing over 100 ft in length and an immense width, if we can judge from crosscuts in these two levels. East stope in No. 5 and No. 6 levels are looking better than ever.

**THE BROOKLYN.**—The Brooklyn, in lower level, is developing a large body of rich ore. An idea of its extent and value can be gained from the fact that simply in opening the level 20 stamps are continuously supplied with rock for crushing.

**THE ALEXANDER MILL.**—The mill is doing splendid work, and everything is running to my entire satisfaction.

**MOUNT ROSE DISTRICT.**

**AT WORK.**—Silver State, Jan. 12: The Wild Goose company, whose mine is located in Mount Rose district, is going to work energetically. They have let a contract to sink the shaft, which was started some time ago, in the ledge. The mine is situated near the Bullion, of Paradise, and the owners say that the Bullion drift is now at the Wild Goose line. The shaft, which is now being sunk, is expected to reach the ledge within 50 ft, and when it does so the company will commence extracting ore.

**SILVER CANYON DISTRICT.**

**RUNNING.**—Ward Reflex, Jan. 8: John L. Robertson, engineer of the mill at Silver Canyon, came over Wednesday on a flying visit. He reports the mill at that place running smoothly and giving entire satisfaction. As an evidence of the richness of the ore, he says 5 casks were hung up for a short time and the bottom of the mortar was found to be covered with a sheet of silver that is liable to get thicker before they have a clean-up. This is well calculated to remind an old White Piner of the time when it was necessary to mix barren rock with Eberhardt ore in order to work it. Mr. Robertson thinks they will have some bullion out before he gets back.

**WARD DISTRICT.**

**MARTIN WHITE TUNNEL.**—Ward Reflex, Jan. 15: On a visit recently we all agreed that the tunnel had been run in the right direction, and not too far north, as many contended. The tunnel cuts the porphyry formation in which the ore bodies were found above and runs about parallel with it. Crosscuts demonstrate the fact that the formation is pitching northeast. In the upper workings it pitches southwest. A crosscut 2,600 ft from the mouth has been run 300 ft southwest, and has cut through the porphyry in that direction. In another, 2,100 ft from the mouth, running northeast, a vein of ore 1 ft wide has been encountered a short distance from the tunnel, some of which assays as high as \$100 to the ton. The 2000-ft crosscut has run through 20 ft of barren quartz and was getting fairly into porphyry at the time of our visit. Several other cuts have been run which go to show the ore to be in the fine mine, and the hanging wall. The ore found a few feet from the tunnel on the north side encourages this belief.

The Paymaster, so far, greatly resembles the Comstock, and if large bodies of ore are found in the lower workings it will be equally as permanent.

**WHITE PINE DISTRICT.**

**RESUMED.**—Cor. Eureka Ledger, Jan. 15: The Eberhardt & Aurora Co. has resumed and purpose to push the tunnel ahead vigorously, and will shortly begin crosscutting and prospecting in good shape. The snow on the Treasure hill is 10 ft deep and there is no passage for teams. The once famous Treasure hill has lost to show the vestige of its former metropolitan prominence and gasped its last with the old year when its 87 postoffice was discontinued. There is one mine working on White Pine mountain, the Trench.

**ARIZONA.**

**GLOR NEWS.**—Silver Belt, Jan. 8: We hear encouraging reports from the Centennial. We also learn that dur-

ing the coming week the superintendent will send in the Globe mill from 75 to 100 tons of ore, which will probably mill as high as \$200 per ton. Two shifts are running on the California, and ore is being hauled to the Champion mill. It is claimed by those who ought to know, that the ore will yield not less than \$225 per ton. Mr. Wilder, at a depth of 150 ft, is drifting southeast for the Telfair ledge. The indications are that he will strike it in about 20 ft. Under Joe Caldwell was in Globe from the East Verde the present week, bringing with him gold retort, worth \$17 per oz, which aggregated upwards of \$400. This he obtained by assaying—the result of 11 days run. A strike is reported in the Fannie J. of 2 1/2 ft of ore which assays from 88 to 275 ozs. Present showing indicates permanence. Globe district mines are improving as depth is attained. We do not know of a single lode that showed mineral in the croppings that has petered out.

W. B. Helms has contracted to extract, haul and work at the Isabella mill 100 tons Chrome ore. Gen. McDonnell is about erecting a furnace for the smelting of copper ore from the Buffalo mine. George Scott is now taking some very fine copper ore out of the Interloper mine. Yesterday he took out some 5 tons. It is contemplated to smelt the Interloper ore in the McDonnell furnace.

**TURKEY CREEK.**—Miner, Jan. 14: Mr. Jas. Mes, one of our foremost mining men, arrived here last year from Tucson, in Turkey Creek district. He is enroute to San Francisco, and will there procure a 5-stamp mill for the mine, which is now in condition to furnish ore for a much larger mill. It is opened by a shaft 100 ft in depth, also by a 300-ft tunnel. The body of pay ore measures 3 1/2 ft, samples of which have yielded at the rate of \$120 per ton. Being in the midst of a forest of oak, pine and juniper, fuel for the mill and timbers for the mine will cost but a trifle; water, too, is abundant. Samuel Dennis, just in from the Model mine, close in Peeples' valley, says that its owners, Geo. Powers & Co., have fine prospects ahead of them. The company have 20 men at work, 100 tons of ore out and a 2-stamp mill ready to run. Those of our citizens who keep posted on mining matters believe that the large veins recently discovered in Date Creek district are among the best found in the Territory. Good miners and prospectors from the other districts are now in Date Creek district, watching for the main chance.

**PROSPECT DISTRICT.**—Final Drill, Jan. 15: At the Oem mine the work of preparation for the mill is going on. They are grading opposite the tunnel on Queen creek. They have ore enough provided to keep a 5-stamp mill going constantly, and expect to increase to 10 stamps shortly; but as the company has marked its progress hitherto by caution, they are also cautious in erecting machinery, which might prove unsuitable upon a further change of the mine, as the character of the ore may change on further depth.

**EMMA.**—The Emma, in Happy camp, shows promising ore. They are at a depth of 60 ft, the ledge is 52 ft wide on top, and the vein is 15 ft wide in the shaft; good walls.

**TWO BROTHERS.**—The Arizona and Massachusetts Co. have let a new contract for sinking the main shaft 30 ft deeper, and Mr. Nettle is progressing with the work.

**WINDSOR.**—The Windsor shaft is down 30 ft and they are working on a mass of ore, gold rock, looks like California rock, value, \$100 per ton.

**SURPRISE.**—They have struck the ledge in the tunnel and it prospects well at a depth of 230 ft.

**IN SUCCESSFUL OPERATION.**—Arizona Citizen, Jan. 15: W. S. Mahry, who has just arrived from La Noria, reports that the Holland smelter is working most successfully. He was shown through the works, and was surprised at the amount of bullion already produced. Nearly 100 bars (about 5 and 6 tons) having been run out since the smelter recommenced operations, scarcely 3 days before. No difficulty whatever is experienced in working the ore, and the production of bullion, it will be seen, is about 2 1/2 tons daily. This is a very important success.

**MISTERS DISTRICT.**—M. F. Campbell, one of the owners of the Red Buck claim, in Meyers, is in town. He reports everybody busy in the district, in which some important transactions have recently taken place, which will without doubt bring this fine mineral section to the front hereafter long.

**RICH SMELTING ORE.**—Col. Sykes, Tuesday, had some rock assayed in this city which he took from the Veta claim, belonging to Jas. Knight and W. S. Fritz, and lying alongside of the west extension of the San Xavier and the Arizona Queen mines. One of the assays gave the flattering result of 23% copper, 10% lead and \$53.42 silver, while another of the assays gave 23% lead and \$100.50 in silver per ton. The vein is 3 ft wide.

**SALE OF THE YELLOW JACKET.**—On Thursday was negotiated a sale which must have a most important place in the records of the Territory. A company, headed by F. A. Tritle, Bob Morrow, Mr. Head and others, bought the Yellow Jacket property at Oro Blanco, one of the most promising gold mines in the Territory. It is the intention to have a 100-stamp mill running by July 1st of next year. The same man also purchased a few days ago, through the assistance of Col. J. R. James, of this city, the Grand Central extension at Tombstone, as well as other Tombstone property. No better evidence of the future of Arizona could be wished than the fact of the investment by such men.

**COLORADO.**

**LEADVILLE.**—Courier, Jan. 12: This camp may be said in one sense to be wallowing. The number of pay mines has been falling within a year, but the number of competent mine managers has not increased. One-half the mines are being managed by men who hardly know porphyry from quartzite. Nine-tenths of the mines have not been examined for 6 months by a disinterested expert. The owners really know nothing about them. They conduct their business as if it was faro-bank gambling, and then they complain when they lose. Every one who owns a substantial interest in a mine should have it examined, by some one who can trust who is not connected with the management, at least once every 3 months.

**NEW MEXICO.**

**SANTA RITA COPPER.**—Herald and Southwest, Jan. 14: The Romero produces native copper in sheets from 1.16 to 2 inches in thickness. The Carrasco, native copper in nuggets and nigger-heads weighing from 1 to 2,500 lbs. The Guadalupe, red oxide and copper glance. The Lea, azure and black copper glance. Pierson No. 1, iron ore, carrying 20% to 25% carbonate of copper, which makes for the native ore. Pierson No. 2, blue carbonate, flat vein, 2 to 6 ft thick, with 300 to 400 tons of ore exposed. Pierson No. 3, vertical 30-inch fissure vein, azurite. Santa Rita No. 31, vertical 30-inch fissure vein, hard blue copper. Crystal Mesa, on the same property, produces herby crystals, white garnets and fine opals. Jasper Mountain, red and yellow jasper. Pierson Mountain, fine transparent quartz crystals. All crystals, from a star down to a sheet of cast. The Santa Ritas are the Calumet and Hecla of New Mexico.

**MONTANA.**

**ANOTHER STRIKE.**—Butte Miner, Jan. 12: Adam Faraday is to be congratulated on the rich developments in the Morning Star. From the bottom of the shaft, which is 90 ft deep, drifts have been extended east and west in a total length of 360 ft. In the face of each the ore body is between 3 and 4 ft wide, the walls are regular and well defined. The lowest assay made during the past 3 weeks showed the ore, which is a base, to carry 142 ounces in silver. The highest assay was \$342. The average value of the ore is perhaps \$200. About 35 tons of first-class ore are on the dump.

**ALTA MONTANA.**—Helena Independent, Jan. 13: The Alta Montana company have more than realized our hopes as concerning the character and quality of ore that can be extracted from the Alta mine. For the first 23 days of extraction from the Alta, in their ore averages, in the works, over 100 ounces per ton, and the lead percentage is high enough for smelting purposes. The improvement in the Comet mine is most gratifying, and will supplement the output of the Alta with a very rich and desirable product. The cupel furnace, which at one time was thought to be necessary adjunct of the company's works, will not be needed, for some months at least, owing to the better quality of ore now found. Improvement and progress at mines and works are more than ever apparent.

## Mining Debris.

## The Governor's Special Message on the Subject.

Gov. Perkins has sent to the Legislature a special message on the debris question, of which we make the following abstract:

To the Senate and Assembly of the State of California:—In my annual message to your honorable bodies, I stated my intention to treat the subject of drainage in a special communication. The magnitude of the interests at stake, and the complexity of the considerations involved, render it impossible to deal curtly with the topic. When, as here, the very existence of one of the most fertile portions of the State is imperiled; when a destruction of property aggregating immense amounts is threatened; when it is made apparent that a failure to legislate effectively must entail the complete abolition of the State's most important waterways, thus retarding progress and settlement over wide areas through the consequent increase of transportation charges; when, also, there is involved the fate of an extensive productive interest, which adds yearly between \$10,000,000 and \$15,000,000 to the capital of the community; it has seemed to me that it would be a reproach on my administration did I not, to the best of my ability, express my opinion of the gravity and urgency of the situation, and give my reasons for believing it the duty of your honorable bodies to take the whole question under earnest deliberation.

## The Act to Promote Drainage.

Which was passed by your predecessors in office, received my signature in April, 1880. It is already known to your honorable bodies that considerable injury has been done to farming lands by the debris from the hydraulic mines. It is also known to you that some steps have been taken to remedy the evils in operation. Of the nature and extent

## The Injuries Inflicted.

You have already been informed somewhat fully by the reports of the State and consulting engineers. The damage done by hydraulic mining consists in (1) direct destruction of agricultural and other lands; (2) indirect damage to such land; (3) direct injury to the rivers and streams; (4) indirect damage to rivers and streams. The most serious direct damage to property has thus far occurred on the American, Bear and Yuba rivers. The nature of the damage is a practical burial of large areas under the mining detritus, or "slickens," and sand. The property so buried is, in fact, so completely deprived of agricultural value that, in the opinion of competent judges, it can, under the most favorable circumstances, be fit for nothing but raising swamp timber for from 15 to 30 years. As to the extent of the damage done in this way already, the State Engineer has reported the great injury of 43,546 acres of farming lands, rated at present probable valuation of \$2,728,300 for the land alone. The indirect damage to property is most apparent along the main streams—the Feather river and the Upper and Lower

## Sacramento River.

For the most part the difference between direct and indirect damage to property is more in the degree of harm inflicted than in its character. This, however, is not invariably the case. The injuries resulting from hydraulic mining are, in truth, so extensive that it requires both a comprehensive and careful survey to embrace them all. As the State sold the swamp lands on the condition that they should be reclaimed, it must be difficult to show that it is not under any obligation to remove obstacles which render the fulfillment of the conditions thus imposed by it impracticable. The indirect injuries which may be traced without any doubt of difficulty to hydraulic mining are, however, very extensive. In all these cases the future can be predicted from the past. On the one hand are lands already covered with the flood of sand and debris. On the other hand are lands threatened with this flood. And the flood is continually advancing. The lowlands of the whole Sacramento valley are, in fact, threatened

## With Unavoidable Destruction.

That is to say, that an area inclosing from 1,200 to 1,400 square miles of fertile territory is indirectly damaged, and is menaced with ultimate destruction. Nor is this the whole of the situation, for the injury done to the Sacramento valley extends, by a reflex action, to the lowlands of the San Joaquin, and to the lands about the upper bay by a direct movement. It may be said therefore without exaggeration that the indirect damage actually embraces an area extending from Orville and Chico to Benicia on the straits of Carquinez. It is necessary to bear in mind that the destruction of the navigability of the Sacramento river is involved. This would deprive the whole of northern California of competition in transportation. The wheat crop alone of that region may be estimated at 500,000 tons. It may also be fairly calculated that the removal of competition would result in a rise of freight rates to the extent of \$2 per ton. Thus, then, an additional tax of \$1,000,000 a year on the movement of the harvest alone is involved in this question, as concerns northern California. I have endeavored to ascertain, by reference to the assessment rolls and the report of the Board of Equalization, as well as from other sources, the amount of values menaced directly and indirectly by the effects of hydraulic mining. I have above stated the opinions of the State Engineer as to the extent of actual destruction already accomplished. He

puts it at \$6,000,000. Taking the counties of Colusa, Placer, Sacramento, Solano, Sutter, Yolo, Yuba, Butte and Tehama, and estimating the assessed value of the real estate other than town lots, and the improvements, and of the town lots and their improvements, and making what seems a sufficient deduction from the aggregate, I have arrived at the conclusion that the property in these counties threatened with partial or complete destruction cannot properly be placed at a lower estimate than \$60,000,000. Here, then, is \$6,000,000 already destroyed, and \$60,000,000 menaced with destruction. Nor must it be forgotten that this menace is not a mere possibility, but as certain as

## The March of a Glacier

Down a mountain pass. In considering the next question—namely, the results to the State of the destruction of its principal waterways—perhaps it is unnecessary to do more than refer to the voluminous evidences furnished by the State Engineer and the consulting engineers in support of the proposition that these waterways are in danger of destruction. The testimony of these scientific men is to the effect that unless sustained and systematic treatment is applied to the rivers they will shortly cease to be navigable.

## The Value of Land

Cannot be ignored, either. It is evident that if through any cause the cost of transportation is raised \$2 a ton, the products of the region so affected must by this change be put at an increased disadvantage equal to the removal of their lands from a market a distance represented by the enhanced ratio of transportation. I have endeavored to reach an approximate estimate of the loss of values to be apprehended in this direction from the destruction of the principal waterways, and I find that it cannot be fairly stated at less than \$1,000,000. It might appear that the only rational inference from the facts thus far given would be the desirability of putting a stop to

## Hydraulic Mining.

It, therefore, is proper at this point to make some observations on the value and importance of that interest. Hydraulic mining has been carried on in this State for 25 years. The present annual output of hydraulic mines is estimated at from \$12,000,000 to \$14,000,000. It is, therefore, apparent that an estimate of \$150,000,000 for the whole period of their working is not extravagant. It is equally clear that while no accurate estimate of their future output can be made, it is safe to assume that it will be larger than it has been in the past, since the extent of gravel-bearing claims remaining unworked is practically unlimited, and since many very extensive workings have either just been opened or are not yet opened so as to be largely productive. Enough is known to make it plain that the hydraulic mines have contributed greatly to the prosperity of the State, and will contribute still more largely in the future, if suffered to proceed. A very considerable population is supported by these mines. I estimate it at 30,000, and the indirect support is very much more extensive. The counties in which the principal hydraulic mines are situated may be said to depend almost entirely upon the mining industry. All values in those counties are therefore dependent upon the prosperity of this interest. What this involves may be perceived by reference to the comprehensive decline of values in Virginia City, consequent upon the depreciation of the mines on

## The Comstock Lode.

In that case the mining population was thinned out, the value of real property fell to panic prices, and the general effect upon the prosperity of the community was as disastrous as though every man in the city had been directly interested in the mines. Similar results must always follow where the intimacy of the relations between the various interests is as great as in the mining counties of California. The suppression of hydraulic mining, therefore, would in all probability be productive of a general collapse throughout this region. Not only would there ensue a positive and direct loss to the State in the cessation of auriferous production, but the entire industries, commercial activities and general civilization of the mining counties would be virtually destroyed, and it must be apprehended that the tax-paying as well as the wealth-producing capacities of those counties would be paralyzed. I have endeavored as much as possible to confine my observations to matters of fact and legitimate inference, but it is apparent that a great deal remains to be said on the subject of equities, for the discussion of which this is not the most proper place. It is nevertheless evident that the hydraulic mining interest is an important one. It may be said, as regards its annual output, to present a fixed capital of \$100,000,000, and directly and indirectly it affords support to a considerable population. Even the farmers in the valley, who occupy lands on the verge of

## The Mineral Area.

Owe a portion of their prosperity to these mines, which create a brisk demand for their produce, and a demand the loss of which would be severely felt. Clearly, therefore, it must be a very serious business to put a stop by legislation to this great industry, and it seems impossible that those who undertake to study the subject should conclude such a course to be necessary until it had been demonstrated that it was impracticable to save the rivers and the farms and cities without sacrificing the mines. The preliminary and the late surveys of the engineering department have been devoted to the elucidation of this problem. The engineers were

required to ascertain the extent of the injury, present and prospective, and whether remedial measures were available. Their reports have shown (1) that the extent and gravity of the damages and menace are far greater than had been commonly supposed; (2) that it was possible to counteract the ill-effects of hydraulic mining by a systematic treatment of the rivers; (3) that such a systematic treatment of the rivers was necessary in any case, since it would be impossible to meet the exigencies of the situation by merely stopping hydraulic mining. The most formidable danger to the lowlands is due to the deposit in the mountain streams and tributaries of enormous quantities of heavy sand which is being washed down lower every year. The deposit of sand must continue until the entire

## Sacramento Valley

is covered and destroyed, even though hydraulic mining should be stopped at once, unless remedial measures are adopted. In fact, it may be asserted that the stoppage of hydraulic mining in the present stage of the debris evil would produce no alleviation whatever. There is a mass of mining debris now collected in the canyons of the mountains sufficient to cover the Sacramento valley completely a couple of feet deep. It is, however, practicable, in the opinion of the State and consulting engineers, to deal with the situation, and in so doing to at once save the rivers and the mines. In other words, it requires to be ascertained whether the State can better afford to sustain the cost of reclamation than to bear the losses resulting from the destruction of property which must follow either (1) the stoppage of hydraulic mining, or (2) the abandonment of the rivers and agricultural lands and valley towns to the flow of

## The Advancing Wave of Debris.

I have endeavored to give you some adequate idea of the values represented on both sides. It has been shown that if the flow of debris is unchecked, to a positive loss of \$6,000,000 in land must succeed a further loss of \$60,000,000 in real property; that to this must be added at least \$100,000,000 for destruction of waterways, and fully \$1,000,000 a year in freights. On the other hand it has been shown that the hydraulic mines represent a fixed capital of \$100,000,000, that they support a large population, that they constitute the backbone of the commerce and industry of the mining counties, and that their suspension would necessarily involve the decline of all values throughout those counties, and the certain decay of that region of the State. It would appear from these considerations that the burden placed upon the State would have to be very heavy to outweigh the obvious desirability of avoiding the losses with which the commonwealth is threatened whether hydraulic mining is or is not suspended. The surveys of the engineers resulted in ascertaining the practicability of remedial measures, but at the same time showed that the subject was too extensive to be dealt with locally. It was particularly insisted on by the engineers that sustained and systematic treatment of the rivers must be undertaken or that it would be useless to attempt anything. While, therefore, they held out the encouraging consideration that by such a systematic treatment the condition of the rivers might be made even better than it had ever been, they contended that nothing less comprehensive than the methods they proposed would be adequate. It is important to observe that

## Captain James B. Eads.

The distinguished engineer of the Mississippi months, who was fortunately secured by me for consultation, and whose report has been placed in your hands, was especially emphatic on this head. In estimating the probable results of any successful plan of drainage, it became necessary to take into consideration not only the losses and dangers to be avoided, but the benefits to be gained. It was evident that the works which scoured out the river channels, and enabled them to carry their flood volume without inundating the country through which they flowed, would reclaim all the

## Swamp and Overflowed Lands

Along the lower Sacramento. A rough estimate of the values thus to be created by the carrying out of such a system justifies the belief that at least \$70,000,000 would in this way be added to the assessment rolls. Against all these considerations was to be placed the cost of the proposed works. It was not possible to arrive at a clear estimate of this expenditure, but it was believed by the engineers that it could not exceed \$10,000,000, and that it might not exceed \$5,000,000. This brings me to the Drainage Act, which was drawn, I believe, as a compromise measure, but which in its principles appears to meet the logical and equitable requirements of the situation quite closely. It was attempted in this bill to assess a benefit assessment as justly as possible upon the districts to be directly aided.

## The Hydraulic Miners

Were called upon for extra contributions, as seemed proper under the circumstances, and a single light tax of five cents on the hundred dollars was made general. I signed that act in the belief that its principles were just and sound, and I have seen no reason to change that belief since the law went into operation. The justice of a general tax for such a purpose appears to me to be thoroughly demonstrated by the existing relations between the State and the Federal Government. Whenever a State needs some internal improvement which it cannot compass from its own resources, it appeals to Congress, and the

latter rarely fails to concede what is demanded. San Luis Obispo, Los Angeles, San Diego and Alameda counties in this State are now petitioners for appropriations which can only be justified or granted by applying the principle of community interest underlying the measure considered. I am of opinion that California has a very equitable claim upon the general Government for aid in this connection, and I do not believe that Congress will hesitate to recognize it. Such governmental aid should at once be sought and earnestly insisted upon. The general Government sold the mineral lands to the miners and the agricultural lands to the farmers, and received due compensation therefor. It sold the mineral lands with a full knowledge of the fact that the beds of the streams were indispensable channels for the tailings created by mining operations. Since the mineral lands were sold for the

## Express Purpose of Mining.

And since the property so purchased cannot be profitably worked without great injury to the valleys and rivers of the State, our people believe that in equity the Government owes a large contribution to the cost of remedies for the injury inflicted. The precedents for liberal appropriations to aid in the solution of this problem are not wanting. The Government expended \$5,000,000 in the improvement of the navigation of the mouth of the Mississippi river, and the concession was made for considerations which find complete analogy and parallel here. The gold product of our mines flows into the channels of the world's commerce, and the auriferous deposits of our mountains are the treasures of the entire people. The preservation of the navigability of our river system should be the charge of the nation.

As regards the question of gain to the State, it is clear that such a rehabilitation of the principal waterways as will not only remove all danger of further disastrous inundations from the upper Sacramento valley, but will reclaim the swamp lands on the lower Sacramento, must add very largely to the taxable property of the community, induce settlement and cultivation, and promote the growth and prosperity, first, of the northern portion of the State, and second, of the whole State. To what extent these benefits would reach has been shown already in this message. Certainly the advantages to be anticipated by the State are sufficiently substantial. On the other hand, should the Legislature determine to refuse all further aid to the engineering works proposed, and should the debris consequently be permitted to flow on without operation, we have the judgment of the engineers to the effect that the Sacramento valley will at no distant date be rendered uninhabitable; that all the lowlands embraced within it will be destroyed; that the rivers will cease to be navigable; that the cities of

## Marysville, Sacramento and Colusa

(The latter by floods), together with the towns and villages between and around them, will be overwhelmed; and that, for all practical purposes of producing wealth and supporting the Government, this section of the State will be blotted out. But the case of the farmers who have been directly injured or threatened by the debris is not the only one in point. I have already referred to the fact that when the

## State Sold its Swamp Lands

It made their reclamation a prime condition of purchase. Now, when a State imposes such a condition it binds itself, by direct implication, to do nothing which can hinder or prevent the fulfillment of the condition by the purchaser. And it is clear that in the present case the State has not acted up to this requirement, since it has permitted the hydraulic miners to so treat the rivers that all plans of reclamation have proved futile. There can be no doubt of the responsibility of the hydraulic miners for that condition of the rivers which has caused the capital of our swamp-land cultivators to be wasted. Nor can there be any more question as to the concern of the State in the general situation.

I come now to the question of the necessity for some sustained and systematic treatment of the rivers. I am not prepared to express an opinion upon the remedial measures which are proposed by the engineers. It is for you to determine what course shall be taken in regard to them, and it is for you to judge whether they meet the requirements of the situation. But I consider it my duty to point out, to the best of my ability, the need which appears to exist—the imperative need, I may say—for some scientific and comprehensive mode of treatment. The reports of the State Engineer, and those of the consulting engineers, Capt. Eads and Col. Mendell, contain many serious and even startling expressions in this connection. They concur in declaring that there must be a well-devised, carefully-planned, all-embracing system of remedial action, and that nothing less than this will arrest the very grave dangers which

## Menace the State.

They tell us, as the result of their laborious researches, that the lower river channels are raised by the deposits of sand in them; that the upper river tributaries are given a torrential character by the ever-increasing steepness of grade imparted to them in the same way; that, consequently, they bring down their flood waters more swiftly and in greater volume than ever; and that the lower river channels, being choked with sand, are less able than ever to receive and carry this increased volume of water. They tell us that while through these agencies

[CONTINUED ON PAGE 53.]

## THE ENGINEER.

## What Engineers Have to Think About.

The Council of the Institution of Civil Engineers, London, have invited communications of a complete and comprehensive character on any of the subjects included in the following list, as well as on other analogous questions. For approved original communications, the Council will award premiums arising out of special funds bequeathed for the purpose.

1. The frictional resistance of various soils on piers and piles.
2. The most useful sections of rolled iron for structural purposes, having regard to economy of material combined with strength.
3. The present system of making steel for railway purposes, and the properties and character of the material.
4. Machinery for steel making by the Bessemer and the Siemens processes.
5. The tempering of steel and the influence thereby produced on its strength.
6. Experiments on the strength of materials used in construction, with descriptions of the testing machinery employed to ascertain the same.
7. The method of protecting metal work exposed to corrosion, with examples.
8. The comparative effect of "dead" and "live" loads in straining materials and structures, with the factor of safety considered desirable for various proportions of such loads.
9. The forms of staging, scaffolding and centering used for the support of structures during erection.
10. The modern practice of bridge building in Germany, especially with reference to the details of construction and the substitution of bar and angle iron for wide flange plates.
11. The different methods of erecting metallic bridges, with examples of rolling over, building out, lifting bodily, etc.
12. The design and construction of a steel bridge, with particulars of the weight and cost, and of the tests to which it has been subjected compared with an iron bridge of the same span.
13. The action of high winds on lofty and exposed structures, and the best methods for determining the force of the wind.
14. The comparative cost of transport by land and by water.
15. The resistance to traction of vehicles on roads.
16. The best system of working suburban passenger traffic on railways.
17. The most suitable motive power for underground railways.
18. Resistance on railway curves, and recent expedients to diminish the same by lubricated tires, divided axles, loose wheels, or otherwise.
19. The measures hitherto taken, and still necessary for the relief of the mid-land and eastern counties of England from floods.
20. The flow of water through pipes and conduits, with experiments in verification of the existing formulae and suggested amendments and improvements.
21. The mechanical separation and chemical treatment of sewage with analyses of the effluents and of the sludge, and statements of cost in proportion to population and rateable value.
22. The modes of regulating the action of storm overflow from sewers, and the flushing of sewers.
23. The methods used for determining the discharge of rivers with a description of the floats and current meters employed for the purpose.
24. The works carried out on the continent of Europe for the improvement of rivers and of inland navigation generally.
25. The design and construction of building slips for large vessels.
26. The construction of tide gauges and the usual method of carrying out a systematic series of tidal observations.
27. The type of steam engine best adapted for ordinary factory purposes, in respect to economy in the use of steam, as well as in first cost, and in cost of maintenance.
28. The best method of testing steam engines—independent of their boiler—having regard to accuracy of the results and ease with which the tests can be carried out.
29. The modern practice in the design and construction of hoilers.
30. The prevention of smoke from furnaces and domestic fire grates.
31. The use of compressed air as a motive power, particularly as applied to machinery in mines and for traction on tramways and in tunnels.
32. Wind and water as motive powers, compared with steam power and the motors most suitable for utilizing them.
33. The various descriptions of pumps employed for raising water or sewage, and their relative efficiency.
34. The different systems of lifts in use in warehouses and in dwellings.
35. The design and most suitable materials for the construction of bins for warehousing grain.
36. Machinery and vessels for high speed steam navigation.
37. The special construction of vessels for the reception of railway trains on deck, indicating the arrangements for the shipping of such trains on their own wheels at various states of the tide.
38. The relative loss of power due to friction in various parts of machinery.
39. The various classes of lubricants with

records of experiments, showing their relative values and a description of the mode of testing them.

40. The methods and machinery employed in sinking and in working deep coal mines.
41. Coal depots for ocean steamers, the various points involved in their management and the methods of preserving large quantities of coal from deterioration.
42. The methods employed in securing large and irregular-shaped mineral workings, for example the Almaden mines, the great Comstock lode, etc.
43. The combined use of fire-brick, iron and other materials for resisting high temperatures in blast furnaces, kilns, pottery, ovens and similar structures.
44. The disposal and utilization of slags from various smelting processes.
45. The management of underground waters in mining districts, and the relative economy of distributed or trunk-pumping engines, adits, etc., in particular cases.
46. On proportioning mains for the distribution of water and gas.
47. The employment of the electric current for the transmission of sound, and the use of the telephone for practical purposes.

## Useful Information.

## Points in Physiognomy.

Large eyes tell of ardor and activity; small ones of sluggishness, calculation and perhaps cunning. A fullness, or prominence of the eyes indicates a talent for talking and writing with great fluency of language, and especially on generalities. The little knot of wrinkles that radiate from the corner of the eyes in the middle-aged, testify to thorough honesty and truthfulness. The feature may often be noticed in business men of known probity.

The various color of eyes have each their admirers. The light tints signify delicacy, amiability and refinement; the dark eyes power and strong passions, though the sluggish temperament often does not call these into activity. Blue speaks of tenderness and extreme sensibility; brown goes with a frank, womanly nature; hazel is a sign of talent, and of a better head than heart. Give no confidence to a woman whose small, black eyes flash like a bead, for she is prone to selfishness and tattling.

Noses are as diverse in crosses as can well be, though for convenience they are grouped into five well-known classes. The Roman for the positive and aggressive man, the harsh-faced conqueror who cares nothing for the slaying of multitudes to achieve his own fortunes. Its peculiarity is the production of a ridge near the upper end. The Greek is the classic nose, denoting artistic tastes and keen refinement. It has throughout a regular and delicate outline. The Jewish or hawklike nose is known to all. It fits the sharp trader, the speculator and the money dealers. The celestial, or turned-up nose, is merely the snub, lengthened a little. It is found in inquisitive children, and often among the fair sex.

The mouth is the most tell-tale feature of the whole countenance. Have the lips retained the fair curves of childish purity, or has an indulgence in drinking or other dissipation made the lips coarse and flabby? Here, as elsewhere, a delicate shape means a fine susceptibility, while a coarser form reveals a rude nature. Quite a number of little muscles cluster about the corners of the mouth, and their involuntary motions often let out a secret that the lips and eyes have concealed. A steady friend is not to be looked for in one whose lips are perfectly smooth, but, instead, where the red is crossed with upright wrinkles. Hospitality displays several slightly curved wrinkles, outward and downward from the corners of the mouth. Large and full red lips stand for a loving and faithful disposition.

Less attention is usually given to studying the chin than it deserves, as it is often concealed by a beard. It is intimately connected with the cerebellum or basis of the brain, which is the organ of vital power—so much so that if one be poorly developed the other will be also. The deeper and wider the chin and lower jaw, the more will be the unconquerable firmness even to audacity, and the larger will be the corresponding development of the cerebellum.—*Golden Days.*

**SOLID MUCILAGE.**—Mucilage in a convenient solid form, and which will readily dissolve in water, for fastening paper prints, etc., may be made as follows: Boil one pound of the best white glue, and strain very clear; boil, also, four ounces of isinglass, and mix the two together; place them in a water bath—a glue pot will do—with one-half lb. of white sugar, and evaporate until the liquid is quite thick, when it is to be poured into molds, dried, and cut into pieces of convenient size.

**PAINT FOR BASEMENT WALLS.**—A dry coating for basement walls may be made as follows: Take 50 lbs. of pitch, 30 lbs. of resin, 6 lbs. of English red and 12 lbs. of brick-dust. Boil these ingredients, mix them and stir thoroughly, then add about one-fourth the volume of oil of turpentine, or enough to make it flow easily, so that a thin coating may be laid on with a whitewash or paint brush. Walls thus coated are proof against dampness.

**SPONTANEOUS COMBUSTION OF SOFT COAL.**—The Boston Manufacturers' Fire Insurance Co. states that at present rates of prices semi-bituminous and soft coals are coming into more general use than they have been, especially culm or fine coal. Members are warned that, with few exceptions, such coals are very liable to spontaneous combustion, if stored when the least wet or damp in closed sheds where there is little or no circulation of air. If such coal is not protected from being wet, it is said to deteriorate. The company objects to the storage of semi-bituminous or bituminous coal in or under any building that would expose a risk taken by this company to danger if it took fire. It is suggested that a roof may be sufficient to protect soft coal from being much wet, and that, under a roof not confined at the sides, there would probably be such a free circulation of air as to prevent spontaneous combustion.

**THE UTILIZING OF THE TIDES.**—A Philadelphia engineer has invented, it is claimed, a machine by which the power of the tides can be utilized. Numerous plans have been proposed for the accomplishment of this most desirable end, but only under exceptional conditions have they been practical or economical. If the new device can harness the tide in an open channel, so as to convert any considerable portion of the vast power into working force, the inventor will rank among the great benefactors of humanity. Emerson says somewhere: Hitch your wagon to a star. A device for utilizing mechanically the free tides, as they sweep along our shores, would come next to that, since it would enable us, through converters and carriers of electricity, to hitch our wagons to the sun and moon.—*Sci. Am.*

**WHAT WOMEN INVENT.**—Some one who has taken the trouble to count the patents issued to women finds that the number for the year ending July, 1880, was 70, and 10 more than the average. Most of the inventions of women have to do with household appliances. Among the past year's are a jar lifter, a hag holder, a pillow-sham holder, a dress-protector, two dust pans, a washing machine, a fluting iron, a dress chart, a fish boner, a sleeve adjuster, a lap table, a sewing machine treadle, a wash basin, an iron heater, sad irons, a garment stiffener, a folding chair, a wardrobe bed, a weather strip, a churn, an invalid's bed, a strainer, a milk cooler, a sofa bed, a dipper, a paper dish, and a plating device.

ENGLISH papers mention the casting of a 43-ton anvil at Motherwell, as a piece of exceptional skill. Pittsburg makes one almost four times larger, and says very little about it.

## GOOD HEALTH.

## Salves and Plasters.

The tinsmith or plumber who goes through a year's work at his trade without a severe cut or burn is fortunate, but he considers himself equally fortunate if, in the case of a severe injury, he escapes from the dangers of salves and plasters. In regard to their injurious effect upon the skin, Dr. Van der Wrede, whose skill in medicine is quite equal to his knowledge of science, says:

"Plasters and salves are more dangerous even than oil silk or rubber overshoes, as they are usually applied to wounds and sores, and in many cases produce more harm than they do good as they usually protract the cure, and often prevent it entirely. The cause is simply that plasters and salves are mostly waterproof, and therefore interfere with the natural function of the skin; if either of them is placed on a sound portion of the skin, and kept there for a few days the skin becomes sore. Their application is often the cause of the difficulty in healing wounds. Scores of cases have come under our notice where our advice to discontinue the use of so-called healing salves caused a finger which had been sore for months and kept sore by the continual application of different kinds of salves, to heal rapidly as soon as the use of salves was discontinued.

"It is the same with plaster; we have seen it over and over again, that a cut wound which had been covered with a plaster to shut off the air, as a foolish prejudice teaches, had a most protracted and painful course, while a similar wound, simply treated by bringing the edges together and covered with a piece of linen to keep it clean healed in a few days. This keeping clean does not mean to keep off dust and foreign substances, but to clean off the dried blood which may cover the cut. It is even often advisable to put some blood over the edges of the wound after they have been brought together with a few stitches or narrow cross strips of plaster, which, however, must never be allowed to cover the wound. It should not be lost sight of that the skin is made for contact with the air, and that this contact is necessary, not only to keep the skin in healthy condition, but also when repairs are going on; therefore no water-proof plaster should interfere. But blood is soluble in water and absorbs air, and it has a great healing power; in fact, there is no healing salve so efficient as the blood which often covers a wound, and which, therefore, must not be interfered with, by any means.

Under a dried crust of the blood repair goes on actively, as blood contains all the elements required for such repair, and renewal of tissues

wants the nourishing ingredients which are found in the blood.

From long experience of both methods of treatment, we can heartily interpose all that the doctor says. We have frequently treated severe burns by pasting a sheet of white tissue paper over them, using pure gum-Arabic freshly dissolved in water. The object of having the gum fresh was to make sure that it had not soured or fermented. Burns which have begun to fester from the use of oils or ointments will frequently yield at once to such treatment, the swelling and inflammation quickly subsiding, healing beginning and the pain ceasing.

## Chian Turpentine in Cancer.

The use of Chian turpentine for cancer created quite a sensation a few months since throughout the medical world; but the promises of its usefulness held forth by a few individuals do not seem to be sustained in general practice, and now we have on authority of the *Lancet* that at a recent meeting of the Medical Committee of the Middlesex Hospital, London, it was resolved that no more Chian turpentine should be ordered for the treatment of cancer, as, after a prolonged and careful trial, it had been found that its results were perfectly negative. Dr. Henry Morris, a distinguished English physician, after giving Chian turpentine a pretty thorough trial in several cases of cancer, the details of which he gives in the *Lancet*, arrives at the conclusion that this recently vaunted remedy is utterly valueless in this dread disease. He says: "I am not able to report that there is a single symptom over which the drug seems to exercise even frequently, not to say constantly an influence. It cannot be relied upon to assuage pain, to diminish or alter the character of the discharges, to check hemorrhage, or promote the destruction of the growth by ulceration or sloughing. In the few cases in which the patient at first thought she was benefited, the impression was due to that 'clutching at straws' tendency, that is so often observed in persons suffering from lingering and incurable disease, and to her being encouraged to think that she was taking a new and certain cure. Rest, regulation of diet, attention to the bowels, an anodyne at night, and the extra local cleanliness which follows from the use of injections and lotions, will of themselves, and without any internally administered drug, give temporary ease and improvement."

**BOYS AND SMOKING.**—A timely note of warning is sounded by the New York *Times* against the growing evil of smoking among boys. It states that "careful experiments lately made by a physician of repute prove that the practice is very injurious." Of 35 boys, aged from 9 to 15, who have been in the habit of smoking, in 27 he found obvious hurtful effects; 22 had various disorders of the circulation and digestion, palpitation of the heart, and more or less craving for strong drink; and 12 had ulceration of the month. All were treated for weakness and nervousness, but successfully only after they had relinquished smoking. The *Times* says of the smoking: "One of the worst effects is the provocation of an appetite for liquor, which, indeed, is not confined to the young, but which grown persons are better able to manage. When boys drink to excess they are almost invariably smokers; and it is very rare to find a man over fond of spirits who is not addicted to tobacco. Men who want to give up drinking usually have to give up smoking at the same time, for they say that a cigar generally excites a desire for liquor very hard to control." The great increase of smoking among boys in recent years is one of the alarming tendencies of our time. There ought at once to be inaugurated a vigorous anti-tobacco crusade throughout the land.

**SENSIBLE DRESSING.**—There is a class of women one meets with every day, whose dressing is above reproach. They go out to walk, not to show their clothes, but to add to their line stock of health. They look as if they could sit a horse well, and as if they used often the luxury of a bath. They wear thick-soled shoes, with low, broad heels, shapely and well-fitting. Their walking and church suits are of cloth, plainly made, but of exquisite fit. Their gloves and bonnet strings are above reproach. The hair, well cared for, is prettily waved or curled about the forehead, and worn low, to show the shape of the head—a style that artists love. Unless nature has been very niggardly no false hair is allowable. The bonnet is close and very becoming, and the face is protected by a veil. An ample parasol or umbrella is ready as protection against sun and rain. What fault can the most censorious man find with a costume like this?

**DIGESTIVE PRINCIPLE OF FIG JUICE.**—M. Bouchut, who has been investigating the digestive principle of the papaw tree, has extended his researches to the common fig, and the result of preliminary experiments, carried out upon the milky juice collected from a fig tree in April last, seems to show that this juice contains a powerful ferment capable of digesting albuminoid matters. As much as 90 grammes of fibrine, added in eight successive portions at intervals of one or two days, to five grammes of the milky juice, and kept at a temperature of 50° C. was for the greater part digested, leaving a small amount of a white homogeneous residue, and the solution having the odor of good broth.

## The Week.

The Legislature is still in session, and the "hoom" in bills still continues. Great numbers of bills are introduced, which will of course never be even considered. We give in another column an abstract of such business as will be of interest to our industrial readers.

We give in other columns of this issue important documents which every one should read. These are the Chinese treaties, and the Governor's special message on the debris question.

Concerning the latter it is only necessary to say that it gives a clear and distinct description of the question as it hears on both the mining and agricultural industries. The question is now being discussed at Sacramento quite carefully.

As to mining news our regularly weekly summary gives all that is current, and we commend its perusal to our readers. It will be seen that the miners everywhere are hard at work developing their properties. It may be noticed, moreover, that in this State at least, there is less "waiting for capital" than formerly, the miners pitching into work as if they meant business. This is a favorable feature in the mining industry. Work, not waiting, will pay best in the long run. The miner can work and capital will come to him more readily than it will when he waits without working.

Cloudless skies and sunny days close the week. While the telegraph brings us news of violent storms and very bad cold weather from nearly all over the world, we are here enjoying a climate appreciated the more by the great contrast.

THE Utah and Northern Railroad Company has 21 locomotives actively employed and 15 new ones ordered. As each locomotive requires 10 box and two flat cars, the total rolling-stock for 1881 will be 720 cars and 36 locomotives.

## Metallurgical Centers.—Continued.

The presence of gold as well as silver in an ore which is to be leached by the usual method, necessitates two chloridizing and two leaching operations. The silver is chloridized by roasting the powdered ore with salt; the gold by exposing the roasted and slightly-moistened ore to the action of chlorine gas.

Leaving out of consideration that limited class of silver ores which can be successfully treated by amalgamation without roasting, we may say that roasting with salt is indispensable in extracting silver from non-smelting ores. The subsequent chlorination for gold is not so expensive as many suppose. At San Francisco prices for material, the chlorine, in the ordinary way of working, does not cost more than 80 cents per ton of ore treated. In extensive works near Carson City, purchasing material in large quantities, and with means of avoiding the waste which occurs in small works, it need not cost 50 cents per ton of ore. The item of additional labor, beyond that required for silver alone, is inconsiderable in any case, and would be inappreciable in large works. Moreover, it may safely be asserted that the extra expense of the gold extraction would be covered by the additional yield of silver consequent on the action of chlorine gas on the roasted ore. The leaching for gold takes the place of the washing, which is always necessary before roasted silver ore is leached with "hypo" for the extraction of silver, so that it cannot be considered an extra expense.

The first objection is thus disposed of, so far as concerns ores in which the gold is distinct from the silver, as is commonly the case. The presence of an alloy of the two metals presents no difficulty, if the particles are very fine; otherwise, the silver chloride, forming a crust on each particle, impedes the action of the chlorine on the gold. In the latter case recourse may be had to alternate leachings, beginning with warm brine for silver, and following that with chlorine water for gold, or by Hofmann's method of leaching with hypo for silver, partially drying the ore, and then chlorinating for gold in the usual way. The latter process has been applied with great success to rich concentrations containing much lead, which was removed by washing the roasted ore with hot water before extracting the silver, but in a complete establishment such material would be smelted.

Leaching with warm chlorinated brine, under pressure, is one of the few known methods of simultaneously extracting gold, silver and copper, which we do not at present insist on, because of certain difficulties in its practical application, which, however, may probably be overcome.

The most serious obstacle to the application of leaching is, the want of permeability in many crushed and unwashed ores, caused by the presence of clay. This trouble can, in many cases, be overcome by the application of atmospheric pressure on the surface of the leaching liquid in a filtering vat, through the agency of what is called a *suction pipe*, containing a vertical column of the liquid from 6 to 20 ft. deep below the vat; or, by means of a pump drawing from the vats below the filters. In other cases it is met by the method of *decantation*, which consists in agitating the ore, together with the solvent, in a large vat, allowing the ore to subside, and drawing off the clear solution of the metals. Another method by which ores, which were almost impervious to liquids by way of filtration, have been successfully leached was, by allowing a small stream of the solvent to flow into the lower part, and out of the upper part, of a vat containing the ore, the latter being kept in suspension by gentle stirring, and the rise being so deep that only clear liquid could rise to the outlet. This method is capable of being systematized so as to be very convenient and economical, especially in regard to copper and silver.

In general, however, this class of ore would be subjected to a process of concentration, by which the slimy matter would be removed, carrying with it a portion of float gold and silver chloride, etc., and would be, after submergence in reservoirs, worked off in the smelting furnaces, or amalgamated; the heavier portions would be at once roasted and leached, or separated, by sizing and jigging, into smelting and roasting material, etc. The greater portion of the quartz or other gangue matter would thus be eliminated.

Low grade ores of copper and silver can be economically and thoroughly treated for both metals at once by the Hunt and Douglass leaching process, the silver being precipitated in metallic state by cement copper enclosed in porous envelopes, on which the pure silver will grow in beautiful crystals, uncontaminated by mixing with the finely divided copper. The copper can, in a similar manner, be obtained in a state of purity by precipitation on hags containing an impure iron sponge, made at the works from ferruginous tailings of roasted and chlorinated aniferous sulphurets, or from magnetite or other rich iron ore abounding in the mountains. However, old iron in abundance could be obtained for a long time in the vicinity of Carson City.

The tailings, from auriferous sulphates treated by chlorination and leaching, make an excellent flux for smelting galena or quartzose ores, and any gold they may contain is recovered in the

operation. A pigment for common red paint may also be made from this material by a simple process of elutriation.

The leaching processes possess important advantages over amalgamation for ores, which must in either case, be roasted, as would certainly be the case with the concentrations from the low-grade Comstock ore, a material which presents none of the difficulties here pointed out. The advantages of leaching consist less in the diminished cost of this working plant, which, in a permanent establishment with abundant capital, would be a secondary consideration, than in the current cost, which is of the utmost importance. The apparatus once erected is almost indestructible by use, hence stoppages for repair or renovation are reduced to a minimum, as is also the cost of power. The cost of material for the leaching is not greater than that of quicksilver, etc., for amalgamation, and the results obtainable are better. Copper in the ore, which causes difficulty and expense in amalgamation, is, in leaching, a source of profit. The risk of loss through carelessness or accident, is less in leaching, and with a proper arrangement of dumping-vats, and a stream of water for the removal of tailings, the labor of handling the ore is about the same. Even in the matter of obtaining the hullion in the form of bars from the crude products of the process, the advantage is not on the side of amalgamation, unless where very fine hullion is got, and then some considerable benefit in the matter of discount results, in leaching, from the circumstance that the gold is obtained separately, while the silver can always be got at least 800 fine, and frequently much finer.

## A State Hospital and Asylum for Miners.

The following is the full text of the bill for a hospital for miners, introduced in the Assembly by Joseph Wasson, of Mono.

SECTION 1. There shall be erected, as soon as conveniently may be, upon some suitable site, to be determined and obtained as is hereinafter provided, a public hospital and asylum for the reception, care, medical and surgical treatment and relief of the sick, injured, disabled, and aged miners, which shall be known as the "California State Miners' Hospital and Asylum."

SEC. 2. The Governor shall nominate, and, by and with the advice and consent of the Senate, appoint five persons, to serve as Trustees of said institution, who shall be a body politic and corporate, by the name and style of the "Trustees of the California State Miners' Hospital and Asylum," and shall manage and direct the concerns of the institution, and make all necessary by-laws and regulations, and shall have power to receive, hold, dispose of, and convey all real and personal property conveyed to them by gift, devise or otherwise, for the use of said institution, and shall serve without compensation. Of those first appointed, two shall serve for two years, and three for four years; and at the expiration of the respective terms, each class thereafter shall be appointed for four years. A vacancy in said Board, from any cause, shall be filled by appointment by the Governor for the unexpired term.

SEC. 3. The said Trustees shall have charge of the general interests of the institution; they shall appoint the Superintendent, who shall be a skillful physician and surgeon, subject to removal or re-election no oftener than in periods of ten years, except by infidelity to the trust reposed in him, or for incompetency.

SEC. 4. The Trustees, by and with the consent of the Governor, shall make such by-laws and regulations for the government of the institution as shall be necessary; they shall appoint a Treasurer, who shall give bonds to the people of the State of California for the faithful discharge of his duties; and they shall fix the compensation of all officers, assistants, and attaches who may be necessary for the just and economical administration of the affairs of said institution.

SEC. 5. Indigent miners shall be charged for medical attendance, surgical operations, board and nursing while residents in the hospital and asylum, no more than the actual cost. Paying patients, whose friends can pay their expenses, and who are not chargeable upon townships and counties, shall pay according to the terms directed by the Trustees.

SEC. 6. The several Boards of Supervisors of counties, or any constituted authority in the State having care and charge of any indigent, sick or aged person or persons, if satisfactorily proven by them to have been miners, shall have authority to send to the "California State Miners' Hospital and Asylum" such persons, and they shall be severally chargeable with the expenses of the care, maintenance and treatment, and removal to and from the hospital and asylum of such patients.

SEC. 7. The Trustees shall annually, at such time as the Governor may designate, report to him for transmission to the Legislature, such a statement as he may require as to the management of the said hospital and asylum.

A FURNACE FOR WALKER RIVER.—The whole of the cast-iron work for the smelting furnace which is being put up by Senator J. P. Jones and others in the Walker River country has been shipped from this city. The smelter will soon be turning out ingots of copper.

LAST week Butte, M. T., shipped over \$40,000 in hullion. At this rate that lively little town will soon achieve her promised eminence.

## Physical Studies of Lake Tahoe.—No. 4

[Written for the Press by PROF. JOHN LE CONTE.]

## Colors of Transparent Liquids.

So far as known, the colors of transparent liquids are due to the modifications of white light produced in the interior of the substances traversed by the luminous rays. Besides the well-known chromatic phenomena arising from the refraction and dispersion of light (which are out of the question in relation to this subject under consideration), there are, in this class of bodies, three recognized causes of coloration, viz.: 1st, selective absorption of transmitted light; by which, through the extinguishing of certain rays, the emergent light is colored. 2d, Selective reflection of light from the interior of the liquid; by which, both the transmitted and reflected rays are colored. 3d, Fluorescence; by which colors are manifested by a sort of selective secondary radiation, in which light waves of "greater length than those of the exciting rays are emitted from the interior of the liquid. Although the admirable researches of G. G. Stokes, Edmond Becquerel, Alex. Lallemand, Hagenbach, and others, on the "Illumination of Transparent Liquids," proves that a greater number of such bodies possess the property of fluorescence than was formerly supposed, yet all investigators concur in classifying pure water among the non-fluorescent liquids. Hence in the case of this liquid, in a state of purity, the admitted causes of coloration are reduced to two, viz.: Selective absorption and selective reflection in the interior of the transparent mass.

If the liquid traversed by the light is so constituted that none of the rays are reflected from its interior parts, while selective absorption is active, then the transmitted light is alone colored, according to the rays that may be extinguished by absorption. On the other hand, in transparent liquids in which there is no absorption of light, both the transmitted and the reflected light may be colored by selective reflection. For, it is evident, that if some of the rays are selectively reflected in the interior of the transparent mass, the transmitted light and the reflected light must present different colors. It is, likewise, obvious, that if all of the white light entering the transparent medium is thus disposed of, the transmitted light and the reflected light must present tints which are exactly complementary. In most cases, however, when selective reflection occurs, there will generally be some selective absorption; consequently the color by transmission will not always be exactly complementary to the color by reflection. In fact, this exact complementary relation can not be realized when any portion of the light is absorbed. Moreover, in many cases in which there is a rapid absorption of particular rays, the transmitted and reflected lights are of the same color. For example, there are large classes of bodies (such as solutions of indigo, sulphate of copper, etc., and also various colored glasses), which are of the same color by reflection and transmission. In such cases, the rays of all the other colors are speedily extinguished by absorption, while a portion of the incident characteristic color-rays are reflected, and the rest are transmitted. Thus, in many blue colored solutions, not only is the transmitted light blue, but the blue tint is visible in all directions by means of the diffused light. *Opalescent Aqueous Media.* It is now well established that finely divided substances suspended in water, impart to it the property of diffused selective reflection, whereby certain chromatic phenomena are produced. It has been long recognized, that if about one part of milk be added to 50 parts of distilled water, the presence of the diffused milk globules in the midst of the liquid, imparts to it a bluish tint by the scattered reflected light, while the transmitted light acquires a yellowish color. Similar phenomena are observed when delicate precipitates of magnesia, or of amorphous sulphur, are diffused in pure water; and, likewise, when weak alcoholic solutions of certain essential oils are mingled with this liquid.

The admirable experiments of Ernst Brücke, in 1852 (Pogg. Ann. Vol. 88, p. 363-385), prove that mastic and other resins which are soluble in alcohol, will be precipitated in a finely divided state when added to water; and that when such a precipitate is sufficiently diluted, it gives the liquid a soft, sky-like hue by the diffuse reflected light, while the transmitted light is either yellow or red, according to the thickness, of the stratum traversed. These results have been abundantly verified by more recent experiments, and notably by those of Tyndall (probably about 1857), and by those of the writer during the years 1878 and 1879. The suspended particles of resin are so extremely attenuated, that they remain mingled with the water for months, without sensibly subsiding. In many instances, they are so fine as to escape detection by the most powerful microscopes—they are ultra-microscopic in smallness. Media which possess the property of decomposing compound white light by selective reflection, have been characterized as opalescent. The distinguishing characteristics of opalescent liquids are: 1st, That the reflected and transmitted lights are different in color; and 2d, that the tints of the two colors are more or less complementary. It is evident, however, that when the liquid exercises any selective absorptive action on light, the tints of both the reflected and

transmitted lights will be more or less modified, according to the character of the rays which are withdrawn by absorption. Hence, it follows, that the tints by diffused reflection and by transmission may deviate more or less from the exact complementary relation.

#### Color of Pure Water.

In the investigation of the "Canases of the colors of the waters of certain lakes and seas," it is manifestly of primary importance to determine the color of pure water; for, if it is inherently colored, the tints afforded by impurities must be modified by the admixture of the hues proceeding from this liquid itself. Although pure water in small masses appears to be perfectly colorless, yet most physicists have been disposed to admit an intrinsically blue color as belonging to absolutely pure water, when viewed in sufficiently large masses. Thus, Sir I. Newton, Mariotte, Euler, Sir H. Davy, Count De Maistre, Arago, and others, ascribe the azure tints of the deep waters of certain lakes and seas, to the selective reflection of the blue rays from the molosses of the liquid itself; while the green and other tints exhibited by other waters, are due to the impurities or to various modifications and admixtures of reflected light from suspended materials and from the bottom. More recent investigations seem to furnish some clue to the solution of this problem. R. W. Bunsen, in 1847, was the first to test the color of pure water by direct experiment (Ann. der. Chem. und Pharm. Vol. 62, p. 44-45, 1847). He provided himself with a glass tube 5.2 centimeters in diameter and 2 meters long, which was blackened internally with lamp-black and up to within 1.3 centimeters of the end, which was closed by a cork. The tube being filled with chemically pure water, and pieces of white porcelain being thrown into it, it was placed in a vertical position on a white plate. On looking down through the column of water at the bits of porcelain at the bottom, which were illuminated by the white light reflected from the plate through the rim of clear uncoated glass at the lower extremity, he observed that they exhibited a pure blue tint, the intensity of which diminished as the column of water was shortened. The blue coloration was also recognized when a white object was illuminated through the column of water by direct sunlight, and viewed at the bottom of the tube through a small lateral opening in the black coating. It is evident that the blue tints manifested in these experiments, were those of the transmitted light; and they indicate that pure distilled water absorbs the luminous rays constituting the red end of the spectrum more copiously than those of the blue extremity. But they do not touch the question of the color of the diffused light reflected from the interior of the mass of water itself. About 1857, John Tyndall confirmed the results of Bunsen's experiments, in the following manner: "A tin tube, 15 ft. long and 3 inches in diameter, had its ends stopped securely by pieces of colorless plate glass. It is placed in a horizontal position, and pure water is poured into it through a small lateral pipe until the liquid reaches half way up the glasses at the end; the tube then holds a semi-cylinder of water and a semi-cylinder of air. A white plate, or a sheet of white paper, well illuminated, is then placed a little distant from the end of the tube, and is looked at through the tube. Two semi-circular spaces are seen, one by the light which has passed through the air, and the other by the light which has passed through the water. It is always found that while the former semicircle remains white, the latter is vividly colored." Prof. Tyndall was never able to obtain a pure blue, the nearest approach to it being a blue-green. When the beam from an electric lamp was sent through this tube, the transmitted image projected upon a screen was found to be blue-green when distilled water was used. ("Glaciers of the Alps," Part 2d, (6) "Color of water and ice," Am. Ed. p. 254-255, Boston, 1861). It will be noticed, that Prof. Tyndall makes no allusion to the color of the diffused or scattered light; indeed, his tin tube rendered it impossible for him to observe it. It is evident, that at this time (1857), this sagacious physicist was disposed to ascribe the blue tints observed in purest natural waters, exclusively to their absorbent action on the transmitted light. Thus, extending the analogy of the action of water on dark heat, to the luminous rays of the solar spectrum, he says: "Water absorbs all the extra red rays of the sun, and if the layer be thick enough, it invades the red rays themselves. Thus, the greater the distance the solar beams travel through pure water, the more they are deprived of those components which lie at the red end of the spectrum. This consequence is, that the light finally transmitted by water, and which gives it its color, is blue" (op. cit. supra, p. 254). According to this view, it would seem that pure water is really colored in the same sense as a weak solution of indigo; that is, it is blue both by reflected and transmitted light.

In Dec., 1861, W. Bestz, of Erlangen, obtained results analogous to those of Professors Bunsen and Tyndall, by the somewhat imperfect method of looking through considerable thickness of distilled water at the transmitted light made to pass, by repeated reflections across a box 10 inches long filled with this liquid. The transmitted light ultimately became dark-blue, "with a very feeble tinge of green." (Pogg. Ann. Vol. 115, p. 137-147, Jan., 1862; also, Phil. Mag. 4th series, Vol. 24, p. 218-224, Sept., 1862). My own experiments, executed on various occasions in 1878-1879, afford complete

verification of the results obtained by the preceding physicists. My arrangements were similar to those of Prof. Tyndall, except that a series of three glass tubes—of about 3 centimeters in clear internal diameter connected by India-rubber tubing, and having an aggregate length of about 5 meters—was employed instead of the tin tube used by him. Moreover, instead of the electric beam, I employed solar-light thrown into a large, darkened lecture room by means of a "Porta-Lumiers;" the small beam passing through the first diaphragm at the window, being rendered nearly uniform in diameter by the interposition of a secondary screen, with a small aperture in it, just before the light entered the end of the horizontally adjusted series of tubes. By this arrangement, an approximate mathematical ray was obtained, which secured the transmission of the light along the axis of the column of water, without the possibility of the emergent beam being mixed with any light reflected from the internal surfaces of the glass tube. In every instance in which distilled water was used, the tint of the image of the emergent beam received upon a white screen, was either greenish-blue or yellowish-green; the former tint seemed to characterize the summer and the latter hue the winter experiments.

Likes Prof. Tyndall, I failed to obtain a pure

THE BALDWIN LOCOMOTIVE.

blue color in the transmitted light; the nearest approach to it being greenish-blue. Hence it appears, that in a general way, my experiments confirm the opinion that pure water absorbs to a somewhat greater extent the solar rays constituting the red end of the spectrum; while at the same time, they seem to indicate—in accordance with the deductions of Wild—that the absorption is more active at elevated temperatures. It must be born in mind, that these results relate to the tints of the transmitted light.

#### The Baldwin Locomotives.

The Baldwin Locomotive Works of Philadelphia, well and favorably known all over the world, are represented on this coast by Messrs. Williams, Dimond & Co., 202 Market St.

Every variety of locomotives is manufactured by these works; both narrow and broad gauge, for passenger, freight, logging, plantation or mine service. They recently built a broad

TOOL FOR PREVENTING BOLTS FROM TURNING.

gauge locomotive for the Pennsylvania R. R., which made seven miles in six minutes. The following narrow gauge roads on this coast are using Baldwin locomotives: North Pacific Coast R. R.; Eureka and Palisade; Seattle Coal and Transportation Co.; South Pacific Coast R. R. Co.; Monterey and Salinas Valley R. R. Co.; Sonoma Valley R. R. Co.; Olympia and Tenino R. R. Co., of Portland, O.; Oregonian R. R. Co., Std., of Portland, O.; F. P. and J. A. Hooper; West Evans; South Bay R. R. and Land Co. The Baldwin steam motive for hauling passenger cars is one of the latest successes of this manufactory. The Geary St. Park and Ocean R. R. Co.; the Market St. Extension and the Sutter St. R. R. Co. have this style of engine in use, and their practical working need only to be seen to be appreciated. We should advise all parties in need of anything in the railroad line to call on Messrs. Williams, Dimond & Co. before contracting elsewhere. They represent Eastern car builders, and Messrs. A. Whitney & Sons, the celebrated car wheel manufacturers, also J. W. Hoffman & Co., makers of railroad iron, spikes, bolts, etc., and their facilities for naming figures are unexcelled. An engraving showing one of the styles of Baldwin locomotives appears on this page.

#### Legislative.

The Legislature is still working away making laws and listening to the reading of bills. The following business specially interesting to our readers has been transacted:

Lans' bill to declare hydraulic mining a felony was refused a first reading. The vote was 67 nays and 6 ayes. The author of this bill occupied considerable time for the purpose of denying that he was insincere in desiring the passage of the bill. Camron, the Chairman of the Agricultural Committee, said that he was glad the bill had not come from an anti-debris man because it had been said, both on the floor of the House and outside, that the advocates for repeal were trying to cut off hydraulic mining. The fact was that not one of the anti-debris men were opposed to hydraulic mining; the attack came from the other side. Murphy of San Luis Obispo took the same view, and declared the Lans Hydraulic Mining Felony bill a weak and feeble subterfuge of the debris men to prevent the repeal of the Debris act.

Jackson has introduced a bill to compel the use of a brand, stamp, stencil or trade-mark on all manufactured commodities.

Langford's bill concerning debris from hydraulic mines makes it a misdemeanor to run or

deposit such debris on agricultural land, and provides a further remedy by injunction against such acts.

Gilmore's stock gambling bill provides that a Mining Commissioner shall be appointed by the Governor. Weekly reports of the explorations in each mine must be filed with the Commissioner, with a statement of assays, tons of ore extracted, and, in fact, a history of everything that happens in the mine. If in the interval between weekly reports any strike of ore shall be made, or any fire or flooding happen, it shall be reported at once. A monthly report shall be made by each corporation, showing the condition of the business and the history of the mine for the previous month. Quarterly estimates of the amount of money which would probably be required for the working of the mine for the coming quarter shall be filed. If additional capital be required for working the mine, the fact shall be reported to the Commissioner. Annual reports, accompanied by a map showing the condition of the mine, shall be filed.

Barney's bill is to encourage the Assessors of

datory of an act entitled an act for the better protection of the stockholders in corporations formed under the laws of the State of California for the purpose of carrying on and conducting the business of mining.

Mr. Frasier's bill introduced last week is to pay James W. Marshall \$50 per month for two years (or less, if he dies), for services in discovery of gold, and "no further sum shall be due said Marshall, his assigns or legal representatives."

Mr. Neumann (by request) has introduced a bill about craft proficiency, in effect as follows: All persons pursuing a craft, trade or profession requiring special skill or knowledge to exhibit in place of work a certificate of the craft or trade society. All craftsmen and professional men within 60 days to organize a State or several societies, not exceeding one from each county, that are to examine fellow craftsmen as to competence and issue certificates certifying to competency, etc. Each society to make rules for its own government. All persons affected to comply within three months after formation of society, or be punished for a misdemeanor by fine of \$5 to \$50. Each society to have regulations looking to the detection and punishment of fraud, collusion or disreputable acts of its members. The act not to apply to those who have been three years engaged in any craft, trade or profession or service of the United States, and has a certificate to that effect.

Mr. McCallion wants to make incorporations pay the tax on their stock by amending the code, as follows: The capital stock and franchises of every corporation, association and joint stock company, organized under the laws of this State, shall be assessed to such corporation, association and joint stock company, and not to its stockholders. The value of such capital stock and franchise shall be ascertained by multiplying the market value of one of the shares of stock by the whole number thereof issued, deducting from the product the total assessed value of all other property, real and personal, assessed to it for purposes of taxation in this State and elsewhere. Each person, firm or corporation, owning or having in his or its possession any of the shares of the capital stock of any corporation, association, or joint stock company not organized under the laws of this State, shall be assessed therewith.

In the Senate on Tuesday, Sears' resolution, asking Congress to take charge of mining debris matters, came up and was discussed.

Cheney took the ground that the question should be made a National one at once, and the resolution he adopted.

Chase did not believe that the system adopted by the engineers would accomplish the results desired.

Watson was of the opinion that the resolution should be adopted without reference. He had faith in the system of brush dams, saying that not a foot of the dams had washed away.

Enos said if we endorsed the resolution, we would endorse all that the engineers had done.

The resolution was recommitted to the author for amendment. It was returned amended, and adopted almost unanimously.

McCallion has introduced a bill in effect as follows, concerning trade-marks: Manufacturers to use copy of brand, stamp or stencil or trademark with Secretary of State, designating name and location of person or corporation, manufacturing class of labor employed, and the original design in size adapted to the business. All articles and packages to be marked with such brand. Violation is a misdemeanor. Arrests to be made on sworn complaint, on information and belief.

#### A Handy Tool.

A correspondent of the *Blacksmith and Wheelwright* sends to that journal a drawing of a very handy tool for preventing bolts from turning. Many times, in taking old carriages apart, considerable trouble arises from the turning of bolts, as the small square under the head will not hold the bolt if the nut turns hard. In such cases it is usually necessary to split the nut to get the bolt out. The tool in question will save many bolts and much vexation of spirit. Set the jaws down over the head, B, of the bolt, strike on the top of the jaw at A with a hammer to settle into the wood; then pinch the handles and you will have it held fast, and the nut can then be readily turned off. The tool is about 10 inches long, and  $\frac{5}{8}$  to  $\frac{3}{4}$  of an inch in thickness, measuring through the points joined by the rivet. It will work on bolts from 3-16 to  $\frac{3}{4}$ , and even larger. A blacksmith can make a pair in one hour, and save many hours of valuable time. For the want of a better name we call it a "Polly."

MECHANICS' INSTITUTE LECTURES.—The Mechanics' Institute, of this city, has made arrangements for a course of lectures this winter, the first one of which will be delivered on Saturday evening, January 22d. Prof. W. B. Rising, the accomplished professor of chemistry at the University of California, is the lecturer. The rooms of the Institute are No. 27 Post street, between Montgomery and Kearny. Admission is free, and tickets may be obtained on application at the library. Prof. Rising will speak "On Chemistry," and will deliver six lectures altogether in the course. The doors are opened at 7:30 and lecture at 8 p. m. We hope to see a large and appreciative audience.

To ship ore to Salt Lake from the Wood river (Idaho) mines costs \$60 per ton.

Mr. Wasson's bill is to amend an act amend-

## Mining Debris.

[CONTINUED FROM PAGE 54.]

the flood-height is being raised every year, and the difficulty of guarding against disastrous inundations correspondingly increased, the stoppage of the hydraulic mines would neither remove this great evil nor abate it even for the moment in an appreciable degree. They say that the canyons of El Dorado, Placer, Nevada, Sierra, Yuba and Plumas counties are vast reservoirs of sand, which has been deposited in them by hydraulic mining operations during a period extending from 1854 to the present time. This sand—heavy quartz detritus—is, they state, coming down gradually but surely into the valleys. The river channels are already filled with it, and now the main body is being slowly pushed over into the valleys. But now it has passed the region where it could do no injury, and it is pressing forward. The engineers affirm that if this heavy sand is allowed to cover the valley lands,

Their Destruction will be Absolute. They say further, that even if the hydraulic mines are stopped it will continue to flow for years. They are confident that, though no complete cure for the damage already done can be obtained save through the healing hand of time, it is quite possible to prevent the further extension of direct damage, and to arrest completely the extension of indirect damage in the future. The large rivers, they hold, can be made better than they ever were, by proper treatment; but it must be systematic and continued. Whether, therefore, you acquiesce in the conclusions of the State and consulting engineers as to the merits of the particular methods which they recommend, or whether you conclude that some other plan would be preferable, I trust it may appear as clear to you as it does to me that the question is one which the State must undertake to deal with promptly, resolutely and intelligently.

I have endeavored to show you that I cannot regard the subject as one of merely local concernment, nor, indeed, do I think that a careful examination of it in all its bearings can lead any candid inquirer to a narrower conclusion. You are, in fact, called upon in this case to decide the fate of the Sacramento valley directly, and of very much wider interests indirectly. By this review of facts and inferences I have sought to bring clearly before your minds the magnitude of the problems

The Drainage Bill Presented when placed before the Executive for approval. To have arrested the experiments proposed by the bill would have deprived the people of the State of the right to apply an immediate remedy for the great evils complained of. To have done this without offering other plan or suggestion as to remedies from threatened disaster or succor from impending danger, would have been the assumption of a high responsibility. As representatives of the people the responsibility now rests with you, and with-out recommendation the whole subject is committed to you with confidence in your wisdom, faith in your willingness to give it due and just consideration, and hope in your ability to devise measures of relief which will meet adequately the requirements of the case.

GEORGE C. PERKINS.

FOR SWEATING FEET.—A mixture of three parts of salicylic acid and 87 parts of silicate of magnesia is said to be not only a remedy for sweating of the feet, but, when rubbed over the whole body, on the authority of Dr. Kohnhom, a cure for night-sweating by consumptives.

SEND FOR CIRCULAR.

New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. PH. D., on "The Comstock Lode, Its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. E. M. SLEATOR will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

## JUSTINIAN CAIRE,

IMPORTER AND DEALER IN

Assayers Materials, Chemicals

AND MILL SUPPLIES.

Brass and Steel Wire Screens, Hardware and Fancy

Goods, Opera, Field and Marine Glasses,

Optical Instruments, Etc.

Nos. 521 and 523 MARKET STREET, S. F.

The attention of Assayers, Chemists, Mining and Milling Companies is particularly called to the complete stock of Balances, Furnaces, Crucibles, Brass and Steel Wire Screens, etc., including all the necessities for Assayers and Miners, as also for Milling men. An experience of 30 years in this line of business enables me to guarantee a strict attendance to the orders which my friends may entrust to me. Gold and Silver Tables and a full list of articles to be found in my store, to be had on application.

Mining and Scientific Press  
Patent Agency.

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice free. Address, DEWEY & CO., Office MINING AND SCIENTIFIC PRESS and PACIFIC RAILROAD PRESS, 202 Sansome Street, S. F.—1880.

## INGERSOLL

Rock Drill and Air  
Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Comstock.

GEO. R. FOARD, GEN'L AGENT,  
No. 13, First St., S. F.

## CAUTION.

To John B. Reynolds and the firm of Reynolds & Rix, and the Public generally.

Notice is hereby given that George R. Foard, of No. 13 First Street, San Francisco, is the sole authorized agent for the sale of our manufactures, consisting of Rock Drills, Air Compressors, and duplicate parts of either in the territory known as the Pacific Slope, formerly under the agency of John B. Reynolds, but now under the sole agency of George R. Foard; and that no other person or persons have any right or authority to represent themselves as the agents of this Company within the above mentioned territory.

Also, take notice, that all persons manufacturing, or using any Rock Drills, Air Compressors, or duplicate parts of either, manufactured by others, embracing in their construction the mechanical inventions and appliances covered by the Patents owned by this Company, will be prosecuted for such infringement.

INGERSOLL ROCK DRILL CO.

New York, November 30, 1880.

Scientific and Practical Books  
on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniures, and Gold and Silver Ores generally, with 120 Lithographic Diagrams, 1897.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver, 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, equipments and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$3.00 coin, postage free.

SAVE YOUR  
GOLD AND SILVER.

I am prepared to demonstrate, if miners will bring me from 500 pounds to a ton of their ores, that I can save from 25 to 100 per cent. more than any other machinery now in use. I will make no charge.

Machinery can be seen in operation every day at No. 143 Fremont Street.

M. B. DODGE.

## Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE &amp; CO.

Office, No. 320 Sansome street, Room 10.

## PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

## Metallurgy and Ores.

### Nevada Metallurgical Works,

No. 23 STEVENSON STREET,  
Near First and Market Streets.

Ores worked by any process.

Ores sampled.

ASSAYING in all its branches.

Analysis of Ores, Minerals, Waters, etc.

WORKING TESTS MADE.

Plans furnished for the most suitable process for working Ores.

Special attention paid to Examinations of Mines; plans and reports furnished.

E. HUHN,

C. A. LUCKHARDT,

Mining Engineers and Metallurgists

### JOHN TAYLOR & CO.,

IMPORTERS OF AND DEALERS IN

### ASSAYERS' MATERIALS, MINE and MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, Etc.

118 and 120 Market Street, and 15 and 17 California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full Stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods both as to quality and price. Our *New Illustrated Catalogue*, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

**HAY PRESS.**—Thomas Phares, Eureka, Cal. Patented Jan., 1881. No. 236,253. This invention consists in the employment of a horizontal press, mounted upon low wheels and provided with means for attaching a team by which it may be drawn about the field, so that it may be filled with hay which has been previously raked into winnows, in combination with a horizontally moving follower, actuated by a peculiar double pawl and oscillating pawl hoard by means of a hand lever, so as to compress the hay after the press has been, filled and while traveling about. It also consists in a rear gate with a self-acting latch to release the hale after it has been tied. The pawls are lifted and held out of contact with the ratchet bar, while the follower is retracted to allow the press to be filled again.

**REFINING APPARATUS FOR SPIRITS.**—Pierres Perey, S. F. Patented Jan. 4, 1881. No. 236,251. This device relates to an improved refining apparatus, which is especially designed for the preparation of alcohol or proof-spirits, and for making brandy; and it consists in an exterior case or vessel which is adapted to receive the vapors from the still, or kettle, through a pipe in its bottom, whence they pass through a series of pipes which are surrounded with a body of water, and are deprived of their fusibility by being discharged into inverted bells, or caps, at the tops of the pipes. From these caps the remaining vapor passes upward through a dome, and out at the sides of another inverted bell-shaped top larger in diameter, whence the vapor of the alcohol, or brandy, escapes through a pipe at the top to be led to the condensing worm.

**REFLECTOR FOR SPIRIT LEVELS.**—W. W. Vaughn, Stockton, Cal. Patented Jan. 4, 1881. No. 236,252. This device consists in the combination with a level, having the tubes of this level and plumb placed midway between the sides and opening, equally to both sides of a reflector which is pivoted or journaled above the tube, so that the angle of the reflector may be changed from one side to the other, and thrown outward to any desired degree. It farther consists in partially enveloping or coating the bubble tube with a metallic reflecting surface, whereby the image of the bubble in the reflector will be rendered more distinct.

**WINDMILL.**—W. O. Swinnerton and E. B. Saunders, San Jose, Cal. No. 236,277. Patented January 4, 1881. This invention consists in constructing windmills having a tube extending upward between, and supported by converging frame posts, in combination with a frame, the lower bar of which surrounds the tube, while the upper bar is provided with a haring plate, which rests upon and is steadied by the tube.

## Academy of Sciences.

The regular meeting of the Academy of Sciences was held on Monday evening last. Joseph G. Eastland and Adolph Sutro were elected life members, and Henry E. Mathews was chosen a resident member. Among the donations to the museum, Mr. Lemmon donated a choice collection of rare ferns collected in Arizona, which have been neatly pressed and classified with great care. The Western Fur Company presented a gigantic pair of mounted antlers with the head attached. Captain R. W. Simpson presented specimens of water-rice found in Canada, upon which the canvas-back ducks often feed. W. N. Lockington presented 18 jars of new fishes, yet unclassified. Among other donations to the museum Mr. C. D. Voy presented a reduced fac simile, cast in terra cotta, of the same Aztec calendar stone which was dug up in the Plaza Mayor, city of Mexico, the ancient Aztec capital, where the great Tecalli is supposed to have stood, and where, with the sacrificial stone and the image called Teoyamiqui, they were doubtless thrown down and buried at the time of the conquest. Mr. A. W. Jackson, instructor in mineralogy and geology at the State University, read an interesting and scholarly paper on the "Occurrence of Precious Metals in Sedimentary Deposits." W. N. Lockington read a paper on "Pacific Coast Fishes" describing a number of non-edible varieties. Other papers which were prepared were left over. A letter was received from Dr. Schroeder, of Frankfurt-on-the-Main, claiming to be able to make a 50-inch refractor glass for telescopes by a new method cheaper than a 36-inch glass can ordinarily be made.

**THE DODGE CONCENTRATOR.**—Mr. M. B. Dodge has received the following from the Live Oak M. & M. Co., Hornitos, Mariposa county, Cal.: "The two concentrators we bought from you a short time since have been tested at our mill, and are satisfactory, requiring but little attention and using a small amount of water, and delivering the sulphurates very clean. The power used to drive them is very light indeed, and we believe them to be the best concentrators now in market."

## The Lick Telescope.

Some active steps are being at last taken in the direction of the Lick telescope, which is to be put up on Mt. Hamilton. This firm of Alvan Clark & Sons, of Cambridgeport, Mass., have contracted with Richard S. Floyd, William Sherman, Edwin B. Mastick, Charles M. Plum and George Schoswald, Trustees of the Lick estate, for the construction, for the Mt. Hamilton observatory of San Jose, of an achromatic astronomical object glass with 36 inches clear aperture, to be completed before November 1st, 1883. The sum of \$12,000 was paid at the time of signing the contract, and the further sum of \$38,000 will be paid upon the completion of the work. The terms of the contract are substantially as follows: The firm agree to make, figure, complete and deliver at their workshop the said object glass; the duties, if any, shall be paid by the Trustees; the definition of the glass shall not be inferior to that of the telescopes constructed for the United States Naval observatory in Washington; the glass shall be figured perfectly for one position, to be designated by the Trustees, and work well 20° on either side thereof; the Trustees shall give to the objective such focal length between 50 and 60 ft., as they may determine to be best; they may also designate what two rays shall be brought to one focus by the combined action of the lenses; the firm agree to procure satisfactory discs, if not, this contract to be void; the objective shall be perfected within two years after satisfactory rough discs are obtained by the firm, who shall also construct a rough, reversible, equatorial mounting for the objective, including a suitable tube; the objective, upon completion, shall be inspected by an expert agent appointed by the Trustees, but the firm, if dissatisfied with his decision, may have recourse to arbitration; the Trustees shall pay the firm the cost of the rough mounting for the objective to an amount not exceeding \$1,000, the mounting to continue the property of the firm; if, within five years after the acceptance of the objective, either of the glasses shall be found to have so deteriorated in figure as to injure its performance the firm, if alive and in sufficient health, or either of them, shall proceed to California and correct such defect, the necessary expenses of the trip, and the firm's subsistence while here, being paid in advance by the Trustees.

## Bullion Shipments.

Under this heading we give all shipments since our last issue. We will be glad to receive further reports:

Northern Belle, Jan. 10th, \$7,726.37; Standard, Jan. 10th, \$34,945.62; Con. Virginia, Jan. 15th, \$56,794; Ontario, Jan. 19th, \$9,874; Ontario, Jan. 11th, \$4,969; Ontario, Jan. 16th, \$10,448; Germania, Jan. 14th, \$15,450; Stormont, Jan. 14th, \$5,500; Christy, Jan. 13th, \$2,117; Barhee & Walker, Jan. 12th, \$1,950; Christy, Jan. 14th, \$2,095.

**ACCIDENT TO THE STATE MINERALOGIST.**—Mr. Henry G. Hanke, Chief of the California State Mining Bureau, met with an accident last week which came near being serious. Mr. Hanke left the city some days ago, accompanied by F. G. Smith of Nevada, bound for the mud volcanoes in San Diego county, about five miles from Volcano station, on the Southern Pacific railroad. The region is little visited, and the trains rarely stop at this point, but through the kindness of Mr. Towne they were supplied with letters ordering the train men to allow them to get off at any point on the road, and also to supply them with red lights and torpedoes for stopping the train when they wished to return. They made the fatiguing journey from the station to the volcanoes with moderate ease; but after making preliminary observations Mr. Smith went off to visit an attractive point half a mile away, leaving Mr. Hanke alone with the Chinaman who accompanied them in the capacity of servant. Mr. Hanke began the actual work, measurement of distances, etc., and was just stooping over to take the temperature of a boiling pond when he felt the mud crust give away beneath his feet, exactly as a thin sheet of ice yields to the pressure of a heavy body. Realizing his danger, he threw himself over backwards to escape, but his left foot sank through the crust and the boiling fluid overflowed ankle and foot, settling in the top of the shoe. His foot and ankle are badly scalded. He was brought back to the city and will be confined to the house for a few days.

**MR. LACY**, of the firm of Parke & Lacy, in this city, has been for three months past in the Eastern States, and while there has added largely to the stock of goods, machinery, etc., of the house. They have secured the agency of the celebrated wood-working machinery from the H. B. Smith Machine Works. Also for Hazard's steel ropes and cables, that are claimed to be superior to any make in the world. Parke & Lacy's stock is now one of the largest and most complete in the way of modern machinery on this coast, and is constantly being added to.

ANYONE who has a good second-hand 40-horse power engine and boiler for sale may find a purchaser by consulting our advertising columns.

## News in Brief.

THEY are having snow in Paris. Last year 116 vessels entered the Puget Sound district.

DEER skins sell in Jacksonville, Or., at 45 cents per lb.

THERE are 3,296 more males than females in Sonoma county.

LAST year Montana shipped 25,000 lbs. of deer-skins and furs.

TWELVE persons were killed by the snow slides at Alta, Utah.

HARRIET BEECHER STOWE'S "Uncle Tom" is lecturing in Chicago.

A SERIOUS riot occurred at Wigan, England, among the striking coal miners.

FORTY-EIGHT THOUSAND salmon was the catch from Rogue river for the cannery last season.

JUSTICE SWAYNE has informed his associates that he will resign and go on the retired list, shortly.

THE pacification of Cuba is now complete, according to an announcement made in the Spanish Deputies.

THE miners of Globe, Arizona, have organized an association to establish a mining bureau in Tucson.

IT is rumored the British troops made two sorties from Petro and were both times repulsed by the Bosre.

THEY are having very severe storms along the English coast. The weather is the worst experienced in 20 years.

SUPPLEMENTARY municipal elections in France, as far as known, generally results in the success of the Moderate Republicans.

THE Naval Appropriation bill has been agreed to by the committee. It appropriates \$14,461,037, an increase over last year of \$55,000.

HOWES' bill to provide for ex-Presidents, proposes to pay them annually one quarter of the amount of salary paid while in office.

SEVERAL deaths from scarlet fever have occurred in Dallas, Or., and the disease has been so sudden in its spread that a panic has ensued.

AT Yreka, during this recent storm, over 10 inches of rain fell in 70 hours, and great damage was caused by high water in that region.

A COLLISION between a ship and steamer off the English coast resulted in the sinking of the former and the drowning of 9 persons.

THE Nevada Legislature has passed a bill allowing gambling up stairs or down in cities with a voting population of less than 2,000.

THE Hussars have moved into the district in Lancashire, where the coal miners are on a strike, in order to be in readiness in any emergency.

THERE is only a stretch of 30 miles of staging now between the terminus of the Southern Pacific and Atchison, Topeka and Santa Fe railways.

THE stages between the termini of the Southern Pacific railroad and the Atchison, Topeka and Santa Fe railroad now run under military escort.

THREE temples are being built in Utah by the Mormons—one at Salt Lake, one at Logan and one at Manti. Their costs will aggregate many millions.

THE distress in county Clare is worse than last year. The Lord Lieutenant has ordered a presentment to the Court of Sessions for the organization of relief works.

THE sum of 50,000 marks has been subscribed toward founding an anti-Jewish newspaper, the majority of the Berlin journals being decidedly against the anti-Semitic movement.

A BAND of Indians, in the State of Chihuahua, Mexico, December 23d, killed four men, two women and a child, and afterwards murdered four shepherds and wounded several others.

IN Madrid, Spain, there has been terrible damage by the gales. Telegraphic and railroad communication is interrupted, steamers delayed, Castile mines flooded, and several wrecks are reported.

SECRETARY EVARTS reveals the fact that Blaine will be the next Secretary of State, by the statement made in diplomatic documents that Blaine will carry on the correspondence hereafter.

ABOUT 1,900 New York piano and furniture makers and carvers are on a strike, in consequence of a decision of the employers to reduce wages and make the day's work ten, instead of eight hours.

THERE has been in circulation during the last week at Washington, Alameda county, a petition to the Legislature for a "Local Option" law. A large number of signers were obtained. The movement was initiated by the Grand Lodge of Good Templars.

IN Anaheim and other places the citizens are signing petitions to congress to revoke the act granting to the railroad company the lands in the Mussel Slough district. The requests are based upon the claim that the company has failed to comply with the terms of the act.

ON the evening of the 14th a stage was attacked eight miles east of Fort Cummings by a band of 34 supposed Indians. The passengers were robbed, and it is reported that four of them were killed. The mail bags were carried off. United States troops are pursuing them. It is rumored that the robbers are disguised whites.

## Our Agents.

OUR READERS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send one but worthy men.

J. F. OSBORNE—San Francisco.  
A. C. KNOX—Pacific Coast.  
G. W. McGRATH—Santa Clara county.  
M. P. OWEN—Santa Cruz County.  
J. W. A. WHITT—Merced, Calaveras and Kern counties.  
N. E. BOYD—San Bernardino Co.  
JARRO C. HOAG—California.  
B. W. CROWELL—Colusa and Yolo counties.  
D. W. KALLERHER—Fresno, San Benito, Monterey and San Luis Obispo counties.

## Pocket Mining Atlas,

Containing the principal mining districts in the United States. Compiled from the latest official surveys and the most authentic sources by Edwin Bolitho. Sent, post-paid, on receipt of \$1. Address, Dewey & Co., 202 Sansome St., S. F.

## By Universal Accord,

AYER'S CATHARTIC PILLS are the best of all purgatives for family use. They are the product of long, laborious and successful chemical investigation, and their extensive use, by physicians in their practice, and by all civilized nations, proves them the best and most effectual purgative Pill that medical science can devise. Being purely vegetable, no harm can arise from their use. In intrinsic value and curative powers no other Pills can be compared with them, and every person, knowing their virtues, will employ them, when needed. They keep the system in perfect order, and maintain in healthy action the whole machinery of life. Mild, searching and effectual, they are specially adapted to the needs of the digestive apparatus, derangements of which they prevent and cure, if timely taken. They are the best and safest physic to employ for children and weakened constitutions, where a mild but effectual cathartic is required.

FOR SALE BY ALL DEALERS.

IMPORTANT additions are being continually made in Woodward's Gardens. The grove walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Wa overheard several commercial travelers a day or two ago eulogize the American Exchange Hotel, in this city, as furnishing one of the best tables on the Pacific coast. No higher compliment could be paid to Mr. Charles Montgomery, the proprietor, for commercial men see much of the world, and are the most competent critics.—Hotel Gazette, Jan. 7th.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

## FOR SALE

## By Private Treaty as a Going Concern.

The NEW BATTLE MOUNTAIN COPPER MINES, with Steam Engine and Boiler, Hoisting Machinery, with Boarding House, Office and Dwelling Houses, and a large Concentrating Mill and Ranges at Willow Creek, two miles from the mine, where there is a full supply of water for milling purposes. These mines have been in active operation for the past 12 years and have yielded large quantities of high percentage Copper ore. The mines at present are in regular course of working, and monthly shipments of high percentage ore are being made. The average assay of the ore for the past 18 months, has been 42 1/2% of Metallic Copper.

The Virgin Mine is sunk to the 600-ft. Level and is supplied with ample Pumping and Hoisting Machinery.

The Lake Superior Mine is sunk to the 135-ft. Level.

There is a large quantity of ore in the dumps at surface that can be profitably treated by Milling and Concentrating. The above mines are situated at Copper Canyon, 15 miles from Battle Mountain station, on the O. P. R. R., and 9 miles from the Nevada Central R. R., and are approached by excellent roads.

Further information respecting the property may be obtained of Messrs. HELLMANN BROS. & CO., Front St., San Francisco.

To inspect the property, and for full information thereon, application must be made to SAM'L G. TRURAN, the Superintendent at the mine, who will be open to receive offers for the same, until Monday, the 14th day of February, 1881.

The above property offers a rare opportunity for parties desirous of investing in copper mine.

As the Directors do not bind themselves to accept the highest or any offer.

## NEW BATTLE MOUNTAIN MINES,

Galena P. O., Battle Mountain, Lander County, Nevada.

## '49 AND '50.

MR. JOHN VANCE CHENEY'S new historical story of early days upon this Coast will be commenced in the next number of "The Californian."

A NEW SERIAL STORY will be commenced in the next number of THE CALIFORNIAN which will run during the remainder of the year. It is entitled "'49 and '50," and is a story of early days upon this coast. The author is Mr. John Vance Cheney, whose articles in the leading Eastern magazines and in THE CALIFORNIAN have received such wide and merited recognition. Mr. Cheney has had this story in preparation for THE CALIFORNIAN for some time. Competent critics, to whom it has been submitted, pronounce it at once realistic and fascinating. The stirring events of 1849 and the succeeding year are vividly pictured. Absolute truthfulness of impression is sought rather than idealization. A thread of romance runs through the work, and the interest is sustained to the end.—(Note Book).

### Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. <sup>1/2</sup> Triple Force Caps and all Grades of Fuse.

**BANDMANN, NIELSEN & CO.,**  
SAN FRANCISCO, CAL.

## HYDRAULIC GRAVEL ELEVATORS,

For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

## MOREY & SPERRY,

MANUFACTURERS OF

### Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supply. Iron Work complete for Wood Frames, also

**SPERRY'S  
WROUGHT IRON FRAME  
FOR STAMP MILLS.**

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 800 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

## SECURE PATENTS

Through Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

## The Viaduct of Garabit, France.

Among the railroads in France now in course of construction, we find one of particular interest, owing to engineering difficulties of a special kind, encountered at one point. The large plateau upon which this line is being built is intercepted by a deep ravine called the "Valley of Garabit." The preliminary line of the road had been run on the side of the hills bordering this valley, and to keep an easy grade to a possible crossing, was obliged to make a long circuit in sparsely settled localities, whence neither freight nor passengers would feed the road. After this long detour, the line would reach, on the sidehills of the other side of the valley, a point opposite the line before its deflection, and then assume the original direction across the plains again. The sidehills of this valley being of a schistose formation, and tolerably steep, the laying of the track would have proved very expensive and also difficult. In this dilemma, the administration of public works of France remembered that a certain

The angular beams are of a peculiar form, in the shape of the letter V, whose opening is turned toward the inside in order to admit the entrance of painter and engineer in his periodical inspection of the bridge. A spiral staircase is erected in the center of every pier.

We cannot give here the detail drawings of M. Eiffel's very interesting construction, but will simply say that the arch is in the form of a parabola of the second degree. The foundation for the piers are of stone supported by the bed-rock. It will be seen in the engraving that the key of the arch is 10 ft. in height. The rail is laid between two heavy timbers to prevent accidents.

The force of the wind in this construction has become one of the most important elements in the calculation of stability. The entire cost of the structure will be about 3,100,000 francs, including the very expensive masonry, and preparation of foundations in general.

There are few constructions we think, doing more honor to the engineering profession, than this viaduct of M. Eiffel, and the applause he received from the French society of civil engineers, when he submitted his plans before them, is fully merited.

It appears to us that similar structures to

## Legislative.

The Legislature is working away slowly, but does not appear to be accomplishing so much in the way of passing bills as in introducing them. A great many that are introduced are condemned by the committees as unconstitutional or otherwise defective.

A great deal of discussion is indulged in concerning the debris question. The investigation with regard to the expenditures on the brush dam is still in progress.

The bill introduced by Wasson, of Mono, "To encourage the legitimate mining interests of the State," appropriates \$10,000 for each of the years 1881 and 1882, to be devoted to the Mining Bureau Fund, established by an act passed last year. The money is to be diverted to the above purposes, and is to be paid out by the Board of Examiners.

Pardee has introduced a bill to reimburse the endowment fund of the University in the sum of \$79,000, that sum having been used by the State.

Senate bill No. 30, which excepts mining

sign, and in size adapted to the business of the person, firm or corporation claiming the same. Every person, etc., engaged in manufacturing shall mark, or cause to be marked, in a conspicuous place, each and every article, and each and every barrel, bale, box, cask, package, etc., containing articles manufactured by any such person, firm or corporation, with the brand, stamp, stencil, etc., of any such person, etc., manufacturing the same. It is also provided that no person shall sell, or expose for sale, any article that does not bear the brand or stamp. Any person not complying is guilty of a misdemeanor. Any person furnishing information concerning the violation of the act shall be entitled to half the fine imposed.

## Lieu Lands for Mineral Locations.

Assemblyman Kellogg, of Plumas and Lassen, has introduced the following concurrent resolution, which has received the approval of the Surveyor-General:

WHEREAS, The Supreme Court of the United States has required a judgment to the effect that the grant of lands of the 16th and 36th sections made to the State of California by an

EIFFEL'S PLAN FOR A RAILROAD BRIDGE AT GARABIT, FRANCE.

engineer, named Eiffel, had constructed a bridge at Douro, near Porto, of a height of 62 meters; that there was also in successful operation, the Frihourg viaduct, at an altitude of 78 meters; and the result of these reminiscences was to send for M. Eiffel, and to give him full charge of the project to span the Valley of Garabit with an iron viaduct intended to dispense with the long and profitless circuit to the head of the valley and back.

M. Eiffel went to work in good earnest; and while projecting the strains of his parabolic arch, discovered a possibility of raising arches a good deal higher than the previous height attained, and which were considered as the extreme altitude attainable with ample safety.

The calculations of M. Eiffel convinced him that roadways could be safely carried over metallic piers 100 meters high with a hatter of 10 centimeters to the meter and to contain all the guarantees of stability and security.

M. Eiffel solved the problem of carrying the railroad over the Valley of Garabit, on a level line with the plateaux on both sides, by proposing for construction an iron viaduct 448 meters in length with a peculiar central arch (see engraving) of 165 meters opening, and a middle ordinate (height of arch from spring line) of 65 meters. It will be seen that the vale is elevated 122 meters above the creek Trueyere. The larger piers have in the direction of the lateral thrust a breadth of 6.25 meters at the head, 20 meters breadth at their base, and the other way five meters at the head and 15 at the base.

these, could be profitably used elsewhere, particularly in rough and rugged mountainous regions as are met in California, Colorado and Nevada. One of these arches would span a deep wide canyon admirably, and obviate the necessity of piers being placed at points where their foundations were liable to injury from strong currents of water.

THE STATE ENGINEER'S MAP.—We learn from the report of the State Engineer, that parts of the new map of California, which is being drawn in his office, are approaching completion, and he recommends that it be published by the State as fast as completed, and sold at cost price for the public benefit. The suggestion seems to us an excellent one, for the maps now attainable are but partially correct. The new map will be on the scale of six miles to the inch, and will occupy a sheet about 10 ft. square. This would require a good-sized wall to hold it, but if it can be had in parts it would serve many valuable purposes.

QUITE an excitement sprung up at Buckeye, Butte county, last week. It seems that there was a piece of ground on Walker's plains that had not been taken up, and hearing that Mr. Alstrom, of Spanish Peak, intended to bring down a boring machine this coming summer to prospect the ground with, everybody rushed out to take up a claim. They surveyed the claims on top of the snow.

stocks from securities in which corporations may invest, and which restricts mortgages to first mortgages on real property worth 100 per cent. more than the loan, will be recommended for passage.

Gavigan has presented a petition from the students of the University praying for an observatory at the University.

Wasson, of Mono, of the Committee on Mines and Mining, recommended the passage of the bill to establish a State Hospital for indigent miners.

West introduced a concurrent resolution requesting our Congressmen to secure an appropriation of \$200,000 to continue improvements at Wilmington.

In the Assembly Lane's bill, making hydraulic mining a felony, was killed without a reading.

Fallon, of the Committee on Corporations, reported for passage Assembly bill No. 195, providing for the protection of stockholders of mining companies.

Gorman's bill, "to compel the use of a brand, stamp, stencil or trade-mark on all manufactured commodities," provides that each and every person, firm or corporation engaged in the manufacture of any commodity shall, within 20 days after the passage of this act, procure a brand, stamp, stencil or trade-mark, to be used as herein provided. It shall plainly designate the name and location of the person, firm or corporation claiming the same; the class of workmen employed, whether Caucasian or Mongolian. It shall be of original de-

act of Congress of date March 3, 1853, did not include any mineral land; and whereas, the State has offered such lands for sale, and has issued certificates of purchase for the same, and citizens have in many instances placed valuable improvements and expended large sums of money thereon; therefore he it

Resolved, By the Assembly, the Senate concurring, that the Senators and Representatives in Congress, of the United States, from the State of California, be, and they are hereby requested to use their efforts to secure the passage of a law that will, as far as possible, protect the rights of those persons having certificates of purchase therefrom from the State of California, and to indemnify them against loss, and also to allow the State of California to make other selections of land in lieu of such mineral land in such manner as is set forth in H. R. bill, 4,385, of the 46th Congress, second session.

This subject is of conspicuous interest to mining men, who have erected quartz mills and other improvements of value on the property referred to, and included in the above petition.

New hoisting works are to be erected at the Tintop (Arizona) mine. The 300 ft. level is yielding well, and the mill is crushing the usual quantity of ore. About 100 men are employed about the mine and mill.

The California mine produced 297 tons of ore last week, assaying \$19.46, and the Con. Virginia 495 tons, assaying \$21.79 per ton.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

### Bisbee, Arizona.

EDITORS PRESS:—This point has become of considerable importance in Arizona developments. The greatest interest and most marked developments here are the copper workings.

The Copper Queen mine seems of itself a marvel. Excavations have been made on the hill-sides, and the ore simply quarried out. The deposit has been so extensive that as yet there has been no necessity to sink shafts for ore.

The ore is quarried at a point on the mountain-side, about 200 ft. above the level of the charging floor of the furnace, and is shot down a chute to the furnace ground. The works are smelting about 27 tons of ore per day, making block copper similar to Chile copper bars. The yield of copper is from six to six and a half tons per day. The ore as worked averages 25% net result.

The furnace is the "Water Jacket," made by Bisbee & Williams of San Francisco. All the works, including the furnace and ore development, are under the care of Williams Bros., and appear to be economically and carefully managed. Messrs. Martin & Ballard of San Francisco are the chief owners of the Copper Queen.

While the ore is still being quarried off from the hill-side, as mentioned, yet the company, or owners, in order to get some idea of the extent of the ore deposit, have drifted south into the hill 90 ft., all in ore, and have sunk a winze in the drift 50 ft., and all in ore. From the point where the drift is started it is 60 ft. from the surface, this distance having been gained by the work of quarrying for ore that has been worked. The ground thus worked is about 100 ft. in length by 80 in width; and there have been taken and smelted from this spot about 3,500 tons.

The copper bars are hauled by teams to the railroad at Benton, a distance of 60 miles, over good roads. The smelting is conducted by coke brought from San Francisco.

The Neptune company, which, I believe, is a corporation effected in New York, have copper mines near by, and are believed to be also of great value; but as yet the company has only been prospecting its property.

Feeling satisfied of the value of the mines it owns, the company proposes to erect furnaces of some magnitude on the San Pedro river, about 20 miles on the way from the mines to the railroad. It is understood that the company intend to erect furnaces there of sufficient capacity for all the copper ore the regions round about may produce.

Copper mines exist in the San Jose and Huachuca, as well as in the Mule mountains, but to what extent is of course yet unknown.

Bisbee a little, quiet, active town of a few hundred inhabitants, situated in Mule Pass canyon, several miles in the Mule mountain range. Not many months since only a few tents comprised the habitations here, while now there is quite a town appearance, and some good buildings. A two-story hotel building exists, and is well conducted by Mrs. Grimes of San Francisco.

There are silver mining prospects and a few gold claims in Mule mountains, many of which are promising; but as yet only little development has been made in these properties. But some good mines may be expected ere long from this section of Arizona. C. C.

### Physical Studies of Lake Tahoe.—No. 5.

(Written for the Press by PROF. JOHN LE CONTE.)

#### Has Pure Water any Color by Diffuse Reflection?

In relation to the colors observed in the deep waters of certain lakes and seas, it is evident that the transmitted light cannot reach the eye of the observer. Hence it is plain that if such waters were perfectly free from all foreign materials, in solution or mechanically suspended, there are only two methods by which colored tints can emanate from the interior of such a transparent liquid. These are for pure water: 1. Color tints by diffuse selective reflection from the aqueous molecules; 2. Color tints produced by selective absorption and the diffuse reflection of the unabsorbed light. In the first case the tints of pure water would be analogous to those of opalescent liquids. In the second case the hues would be analogous to those of weak colored solutions, in which the colors by transmission and reflection are the same. In both cases it is absolutely essential, in order that the color tints should reach the eye of the observer floating on the surface of deep waters, that the aqueous molecules should possess the property of reflection; the only difference being that in the first case the reflection is selective, while in the second case all the unextinguished rays are more or less reflected. So that the primary question which is to be settled is: Whether

perfectly pure water has any color by diffuse reflection of light from the interior of the liquid? This, being a question of fact, can only be settled by observation and experiment.

We have already seen that Sir I. Newton, and many of his successors, thought that water exercised a selective reflection on the rays of sunlight which traversed it. In proof of this he records an observation related to him by his distinguished contemporary and friend, Dr. Edmund Halley. Having descended under sea water many fathoms deep, in a diving bell, Halley found, in a clear sunshine day, a crimson color (like a damask rose) on the upper part of his hand, on which fell the solar rays after traversing the stratum of water above him and a glass aperture; whereas the water below him, and the under part of his hand illuminated by light coming from the water beneath, appeared green. From which Newton concluded that the sea water reflects the violet and blue rays most easily, and allows the red rays to pass most freely and copiously to great depths. Hence the direct light of the sun must appear red at all great depths, and the greater the depth the fuller and more intense must the red be; and at such depths as the violet rays scarcely reach, the blue, green and yellow rays, being reflected from below more copiously than the red ones, must make a green ("Newton's Optics," book 1, part II; prop. 10, exp. 17). At a later date, J. H. Hassenfratz verified Newton's explanation by means of a long tube blackened inside, closed at the ends by glass and filled with pure water, through which the solar rays were made to pass. The transmitted light became successively white, yellow, orange or red, as the length of the columns of water traversed was augmented. Annular diaphragms placed at different points in the tube appeared black on the side of the observer at the point where the transmitted light was white, a feeble violet where it was yellow, blue where it was orange, and green where it was red. The diaphragms being illuminated by the ray reflected from the interior portions of the water, the light presented a color complementary to that which was transmitted.\*

It is evident, therefore, that both Newton and Hassenfratz regarded pure water as possessing the properties of an opalescent medium. On the other hand, we have already shown that distilled water really absorbs the solar rays constituting the red end of the spectrum more copiously than those of the blue end, so that the transmitted light comes out greenish blue. The discrepancy thus indicated is doubtless due to the circumstance that in the older observations and experiments the water employed was not sufficiently free from mechanically suspended materials; for the presence of an extremely minute quantity of suspended matter in distilled water is sufficient to change the color of the transmitted solar light from greenish blue to yellow, orange, or red, according to the amount of foreign materials present. Thus, Tyndall found that when an alcoholic solution of mastic and other resins is added to water, a finely-divided precipitate is formed, which, when sufficiently diluted, gives the liquid a blue color by reflected light. Hence, he maintains "that if a beam of white light be sent through a liquid which contains extremely minute particles in a state of suspension, the short waves are more copiously reflected by such particles than the long ones. Blue, for example, is more copiously reflected than red. When a long tube is filled with clear water the color of the liquid (blue-green), as before stated, shows itself by transmitted light. The effect is very interesting when a solution of mastic is permitted to drop into such a tube, and the fine precipitate to diffuse itself in the water. The blue-green of the liquid is first neutralized, and a yellow color shows itself; on adding more of the solution, the color passes from yellow to orange and from orange to blood red." Again he says: "It is evident this change of color must necessarily exist, for the blue being partially withdrawn by more copious reflection, the transmitted light must partake more or less of the character of the complementary color" ("Glaciers of the Alps," "Colors of the Sky," edition cit. ante; p. 259-261).

My own experiments, by means of the series of glass tubes, already described, strikingly confirm the foregoing deductions. Indeed, I was unable to find any natural water however clear, which did not contain a sufficient amount of finely-divided particles in a state of suspension to impart the opaline characters to the transmitted solar light.

The purest hydrant water, as well as the water taken from the Pacific ocean, in lat. 39°, 17' north, and long. 123°, 58' west from Greenwich did not manifest the greenish-blue tint of distilled water by transmitted light, but exhibited colors of the emergent beam, which varied from yellowish-orange to green according to the amount of suspended matter present in the column of liquid. As early as 1857, Prof. Tyndall seems to have fully recognized the important function of finely divided suspended matter in imparting the blue tints to the light

\*The above account of Hassenfratz's experiments is taken from Daguin's "Traité de Physique," third edition, tome 4, article 2,056, p. 417; Paris, 1863. Not being able to find any reference to Hassenfratz's original paper, I wrote to Prof. P. A. Daguin, of Toulouse, and ascertained that the details given in his treatise were taken from the grand "Encyclopédie Méthodique," 1812; "Dictionnaire de Physique," word couleur, page 610. He further informs me that he has never seen the original memoir, and doubts whether it was ever published in extenso. The details given by Daguin are said, by him, to be scarcely less full than those given in the "Dictionnaire de Physique." I have not been able to find a copy of the "Encyclopédie Méthodique" on this coast.

reaching the eye by diffuse reflection from the interior of masses of water. This is distinctly indicated in the account of his experiments already quoted. Again, in speaking of the bluish appearance of thin milk he says, "Its blueness is not due to absorption, but to separation of the light by the particles suspended in the liquid." In reference to the blue color of the waters of the Lake of Geneva, on the 9th of July, 1857, he remarks, "It may be that the lake simply exhibits this color of pure water" ("Glaciers of the Alps," edition cit. ante, pp. 33-34). But a little later, and after making the experiments previously noted, he very significantly asks, "Is it not probable that this action of finely-divided matter may have some influence on the color of some of the Swiss lakes—on that of Geneva, for example?" Again, in speaking of the color of the water of this lake, he says, "It seems certainly worthy of examination whether such particles suspended in the water do not contribute to the production of that magnificent blue, which has excited the admiration of all who have seen it under favorable conditions" (Op. cit. supra, p. 261). Nevertheless, it is quite evident that at this time Prof. Tyndall regarded the suspended particles as playing a comparatively secondary part in the production of the blue tints of the natural waters; for he clearly intimates that pure water has an inherently blue color in the same sense as a weak solution of indigo. It was not until 12 years later that the beautiful experimental investigations of Prof. Tyndall in January, 1869, in relation to the blue color of the sky, the polarization of sky light, and on the polarization of light by cloudy matter generally ("Proceedings of Royal Society," vol. 17, No. 103, pp. 223-233, Jan. 14, 1869), first suggested to J. L. Soret, of Geneva, the analogy which exists, in regard to polarization, between the light of the sky and the blue light coming from the water of the Lake of Geneva. In a letter addressed to Prof. Tyndall, dated Geneva, March, 31, 1869, M. Soret maintains that blue color of the water of this lake is due exclusively to the suspended solid particles, from the fact, which he establishes by direct experiments, that this light presents phenomena of polarization identical with those of the light of the sky. For his experiments show: 1st, that the plane of polarization is coincident with the plane of incidence; and 2d, that the polarization is a maximum when the light received by the eye is emitted at right angles to the direction of the refracted solar rays in the water (Phil. Mag., 4th series, vol. 57, p. 345, May, 1869). Also "Comptes Rendus," tome 68, p. 911, April 19, 1869. Also "Archives des Sci. Phys. et Nat.," tome 35, p. 64, May, 1869.)

During the year 1869, and soon after the publication of these investigations of the Swiss physicist, Alex. Lallemand made a number of interesting communications to the French Academy of Sciences on the "Illumination of Transparent Bodies," in which he attempted to controvert the deduction of Soret, and attributed the diffuse illumination of such media—as well as the peculiar phenomena of polarization above noticed—to the action of the molecules of water, and not to the presence of foreign corpuscles in suspension. The French physicist bases his conclusions mainly upon the phenomena manifested in transmitting beams of solar light through clear glass and distilled water, which he assumed to be optically homogeneous media. (For full text of Lallemand's memoirs vide "Ann. de Chim. et de Phys.," 4th series, tome 22, pp. 200-234, February, 1871; and "Ann. de Chim. et de Phys.," 5th series, tome 8, pp. 93-136, May, 1876.) But the views of Soret were very soon abundantly verified by additional and more refined experimental researches, by which it was proved that under the searching test of a concentrated beam of light traversing such media in a darkened room, none of them manifested anything approaching to absolute homogeneity in relation to light. Under the hypothesis that the illumination of such bodies is due exclusively to the presence of foreign corpuscles suspended in them, it is evident that the more a non-fluorescent liquid (as water) is deprived of heterogeneous particles, the less must be its power of diffuse illumination; and, if we could secure a complete elimination of the particles in suspension, a concentrated luminous beam would produce no laterally visible trace in traversing the liquid. Accordingly, in relation to water, the experiments of Soret, in January and February, 1870, show that the most careful distillation does not entirely remove the suspended matter; although, in proportion to the care with which the distillation was made, the less was the light scattered in traversing the liquid. Moreover, he found that the scattering power of the waters of the Lake of Geneva was diminished by allowing the liquid to repose long enough (many months) to permit the suspended matter to partially subside. Conversely, the experiments of the same physicist prove conclusively that when the number of particles in suspension is augmented—provided they are sufficiently attenuated—the power of illumination in the water was considerably increased without modifying the phenomena of polarization. Thus, it was found, that very diluted precipitates formed in distilled water, gave rise to considerable augmentation in the power of diffuse illumination, and the light emitted transversely to the traversing luminous beam, presented the same characters of polarization as have been previously indicated. For example, a flask filled with water from the Lake of Geneva, which, after long repose, manifested a very feeble power of illumination, when a drop of a

solution of nitrates of silver was introduced, the presence of a trace of some of the chlorides gave rise to a delicate precipitate which was invisible in diffused light; but in a darkened room it exhibited a notable augmentation in the brightness of the trace produced by the passage of a concentrated beam of solar light, and the phenomena of polarization were complete. The addition of a second drop of the solution of nitrate of silver augmented this power of illumination, the trace of the beam appeared distinctly blue, and the polarization became more complete. ("Archives des Sci. Phys. et Nat.," tome 37, pp. 146-155, February, 1870.)

In like manner the experiments of Tyndall, in October, 1870, prove that while, as a general fact, the concentrated beam of light may be readily tracked through masses of the purest ice when made to traverse them in various directions, yet, there were remarkable variations in the intensity of the scattered light; and in some places the "track of the beam wholly disappears." In relation to water, Tyndall was also unsuccessful in entirely removing the suspended particles by the most careful and repeated distillations. His experiments on water taken from the Lake of Geneva and from the Mediterranean sea, off the coast of Nice, show that the concentrated beam of light traversing each of them manifested a distinct blue color when viewed laterally. "Viewed through a Nicol's prism the light was found polarized, and the polarization along the perpendicular to the illuminating beam was a maximum." He adds: "In no respect could I discover that the blue of the water was different from that of the firmament." (Nature, vol. 2, pp. 489-490, October 20, 1870.)

Prof. Ed. Hagenbach confirmed Soret's views in relation to the polarization of the blue light emanating from the waters of lakes, by a series of observations on the Lake of Lucerne.

Without contesting the fact that the polarization of the diffused light emitted from such waters is produced by reflection from minute particles held in suspension; he, nevertheless, suggests that a certain want of homogeneity, due to differences of temperature in the layers of water, might likewise give rise to similar phenomena of polarization. But Soret has shown, by direct experiments, that it is not possible to attribute the illumination and polarization to the reflections from the layers of water of unequal density; moreover, even if these reflections contribute something, in certain cases, to the production of the phenomena, it is evident, that under ordinary circumstances, their influence must be insignificant. ("Archives des Sci. Phys. et de Nat.," tome 37, pp. 186-181, Feb. 1870.) In the light of the results afforded by the preceding experimental investigations, we are now prepared to give a definite and intelligible answer to the question, "whether perfectly pure water has any color by diffuse reflection of light from the interior of the liquid?" It seems to me, that the evidence leading to a negative answer to the foregoing question is overwhelming.

Prof. Tyndall's conclusion, in relation to this point, appears to be a perfectly legitimate induction from the ascertained facts. In speaking of the water obtained from the fusion of selected specimens of ice, in which extraordinary precautions were taken for excluding impurities and which were regarded as the purest samples of the liquid hitherto attained, this sagacious physicist remarks: "Still I should hesitate to call the water absolutely pure. When the concentrated beam is sent through it the track of the beam is not invisible, but of most exquisitely delicate blue. This blue is purer than that of the sky, so that the matter which produces it must be finer than that of the sky. It may, and indeed has been contended that this blue is scattered by the very molecules of the water and not by the matter suspended in it. But when we remember that this perfection of blue is approached gradually through stages of less perfect blue, and when we consider that a blue in all respects similar is demonstrably obtained from particles mechanically suspended, we should hesitate, I think, to conclude that we have arrived here at the last stage of purification. The evidence, I think, points distinctly to the conclusion that could we push the process of purification still further, even this last delicate trace of blue would disappear." (Fragments of Science: "Duet and Disease," pp. 319-322, Am. Ed., N.Y., 1875). In other terms, "water optically homogeneous would have transmitted the beam without revealing the track." "In each water the course of light would be no more seen than in optically pure air." Hence the scattering of the light is not molecular, but is evidently due to the presence of finely divided matter in a state of suspension, whereby the shorter rays of the beam are intercepted and diffused more copiously than the longer ones, thus rendering the trace of the light visible in the liquid and imparting a blue tint to the laterally scattered polarized light. The conclusion seems therefore to be inevitable that, if water were perfectly free from all foreign materials, either in solution or chemically suspended—both chemically and optically pure—it would have no color at all by diffusion of light; in fact, inasmuch as no scattered light would be emitted from the traversing beam, it would show the darkness of true transparency.†

†The presence of colorless salts in solution does not seem to impair the transparency of water or to have any influence on the phenomena of coloration by scattered light. As previously intimated, there is no improbability in the supposition that the existence of certain salts in solution might augment its transparency.

## MECHANICAL PROGRESS.

## Improvements in Metal Working.

The progressive history of the use of machine tools—tools driven by power—in the manufacture of metallic articles is a comparatively brief one, comprehended, or nearly so, in the memory of some of our oldest mechanics. There are men now living who remember the advent of the power planer and the screw cutting engine lathe, and many of the commonest tools now employed in the machine shop were introduced since our middle-aged men were boys. There is no department of useful industry that has made such strides within 30 years as that pertaining to the shaping and finishing of metals.

Thirty or forty years ago the machine tools of a machine shop could be classed under three heads, lathes, planers and upright drills. And the lathes and planers and drills had but a remote family resemblance to those of the present time. There were no special tools, and even the milling machine, now in so general use, was merely suggested by the crude "elabher." Indeed, there were few shops that possessed an iron planer, and the cold chisel and hammer were in use for the dressing and truing of all plane surfaces. Some very neat jobs were made, however, by means of these crude tools and the after finish of the file. There were, however, attempts at hand planing of iron by means of a plane block and a chisel cutter.

Some of the work done at this time, and with the aid of these rudimentary tools, was of excellent character. It is but a few weeks ago since the writer came unexpectedly on a lathe in use that was built in 1834. The frame was of Southern pine—two parallel planks, some sixteen inches wide and six inches thick, set on edge and bolted through crosspieces and legs. The V-way for head and tail stocks and carriage were of iron, cast in lengths of about three ft., seated in channels plowed into the upper edge of the plank and secured by wood screws. This represented the ordinary lathe of 50 years ago. It will do, even now, a fair job of straight turning.

The first iron planer, of the writer's recollection, was exhibited about 45 years ago in what was then considered a first-class shop. The entire frame, cross-head and all, was of timber. The ways and platen were of iron, and the platen was moved by the alternate winding and unwinding of a log chain at either end of the machine. Of course there was much backlash, and the progress of the work was conspicuous for its jerky, halting motion. To this machine succeeded, in time, nearer approaches to the present planer; a screw feed superseded the chain feed, and has since given place to the cut-rack and pinion feed.

The single spindle upright drill never seemed to suggest the advantage of two or more spindles in the same machine, and even the single spindle drill was used for only the commonest work and the roughest jobs.

Is it possible to conceive of a machine shop thus rigged out at this day? And yet this is a fair picture of what a machine shop was at the end of the first quarter of the present century. The workman of that day was as valuable for his fertility of resource and handiness of contrivance as for his skill in the use of tools and his perfection of workmanship. As compared with the old time shop the modern shop is as a palace to a hovel, or a fine city to an insignificant hamlet. So many are the appliances general and special, for reaching any job and performing the work in the best possible way, that an old-fashioned machinist would feel what the French call an embarrassment of riches, in given his choice of means in such a shop. And yet it would be difficult to show a single instance in which a tool, implement, attachment, or contrivance, even of a special character, is useless or wasted. The saving of minute portions of time in the handling of work, amounting to a mere trifle calculated by one man and a single day, is deemed of importance enough, when multiplied by many workmen and a year's time, to justify the expenditure of thousands of dollars in the production of special appliances.

These improvements are going on now as rapidly as at any period. There is scarcely a single tool making establishment but has now and is constantly receiving orders for special work, much of which is entirely novel and original.—*Boston Journal of Commerce.*

**TO POLISH ALUMINIUM.**—M. Mouray recommends the use of an emulsion of equal parts of rum and olive oil, made by shaking these liquids together in a bottle. When the polishing stone is used the peculiar black streaks first appearing should not cause vexation, since they do not injure the metal in the least, and may be removed with a woolen rag. The object in question may also be brightened in potash lye, in which case, however, care must be taken not to make use of too strong a lye. For cleaning purposes, benzole has been found best. Objects of aluminium can be electroplated without the least difficulty, and Mouray succeeded in imparting to them a bright white luster in passing them successively through a weak bath of hydrofluoric acid and aqua fortis. The effect thus obtained is said to be quite surprising.

## Lathe Saws.

The diminutive circular saws so often used in the lathe for slotting and cutting off should be more extensively employed than they are, and they probably would be only for the difficulty of tempering them without springing. It is scarcely to be expected that verbal directions, alone, can remove this difficulty, but it can be removed by practice. There is a "knack" of tempering, which although not at all mysterious, is very difficult to impart to another. As a retired machinist said, a few weeks ago, he had never succeeded in teaching his method of tempering springs, a department of work in which he was an adept, and he left his successor quite depressed because he could not catch the trick. But after a few failures the trick was found, and the new man rivaled the old hand in spring tempering.

Saws should be cut or punched out of sheet or plate steel, not forged and faced up in the lathe. Let the thickness or gauge of the steel determine the thickness of the saw; for differing thicknesses of saw select differing gauges of steel. It is better, after drilling, to turn several saws at once and cut the teeth of several at the same time, than to work on a single saw. The arbor ought to be of steel and not less than 10 inches long; large enough to turn up at the end for the reception of the saw and leave a generous shoulder. The saw should be secured against this shoulder by a nut threaded on the arbor. A small check-pin is not objectionable. No turning, grinding or other finishing should be permitted on the sides of the saw; leave the old scale as the steel plate came from the rollers.

To harden and temper, fix the saw by its hole to a bar or rod, as though it was an arbor. Heat evenly over a charcoal fire to a good cherry red. Dip it evenly in a horizontal—level—position into a bath of whale or lard oil, moving it horizontally until it is cool. Remove it and with the oil on it heat it over the fire until the oil flashes or flits over the surface. Do not allow the oil to burn. In some cases this after drawing is not required, and for work in very hard metals, water hardening and color drawing may be necessary. But in all cases the saw must be hardened horizontally, not vertically.—*Boston Journal of Commerce.*

## The Locomotive a Precedent for Higher Piston Speed.

Advocates of high piston speed, just now attracting some discussion and exchange of opinions, have a strong argument on their side in the locomotive as built and operated to-day. Certainly, no more prominent instance could be cited in favor of the system. Here is a machine, that depends upon high speeds of piston for its success, and is worked under more adverse and destructive conditions than a stationary engine is ever liable to, yet it undergoes no extraordinary wear and tear while exerting far greater power in the same space of time than the stationary engine. As regards mechanical construction, the locomotive engine displays the most advanced knowledge of the day, in the fitting up of parts, in proportion of bearing and wearing surfaces, and in working steam expansively, as far as the link motion is capable, while in mere endurance of shock and strain of varying loads, handled by different persons of more or less mechanical knowledge, it suffers more in a year than a stationary engine in a lifetime.

No other tools than those already in daily use are required; no mechanics, other than those already trained, need training, so that, if we are to build high speed stationary engines instead of low speed, the necessary appliances and precedents exist. In connection with this subject, and as a practical example of the truth of the statements above, engine 273 on the Pennsylvania railway may be cited. This engine was built in 1875, has 5-foot drivers, and weighs about 38 tons. It has never been repaired until recently, two months ago, and in 49 months' continual use has made a mileage of 251,552. This is only one instance, but doubtless many more could be cited in favor of the practicability of economical high piston speed.—*American Machinist.*

**AN ELECTRICAL BLOWPIPE.**—The electrical blowpipe of M. Jamio, consists of a pair of carbon pencils—an electric candle, in fact—surrounded by a coil of insulated copper wire wound a few inches distant from the pencils in the plane of their axes. The current is so led that, in circulating round the coil, it will attract the electric arc formed at the lower end of the carbon pencils, and cause it to flash out almost in the form of a fish-tail gas flame. This spreading out of the arc is the special feature of the action of the apparatus. It facilitates the application of the heat of the electric arc to the fusion of refractory substances, and enables us better to take advantage of this little-used means of producing a very high temperature.

**NEW STEEL.**—M. Auhe is attracting much attention in France by a new process of converting iron into steel, and producing an illuminating gas by the process. The iron is heated to 900° Cent. in a retort with coke or charcoal; fatty matters are then injected, and dry steam forced over the heated mass; thus steel of high quality is formed and carburized hydrogen gas evolved.

## SCIENTIFIC PROGRESS.

## Ignored Facts in Electricity.

At a meeting of the New York Academy of Sciences, Prof. C. A. Seeley, in a paper entitled "Ignored Facts in Electricity and Magnetism"—fully illustrated by experiments—showed that scientists and the text books misrepresented the phenomena of static induction. It is commonly asserted that if a soft-iron bar be brought near a magnetic pole, the bar becomes a magnet with two active poles, and a point of neutrality between them located at the middle of the bar. It is stated that if an insulated conductor be brought near a prime conductor it becomes electrified, so that the minus electricity occupies the half of the conductor contiguous to the prime conductor, and the plus electricity the remote end, with neutrality between the two halves. But on testing the statements by experiment, it will be found that the induced magnet has only one kind of active magnetism, which is of the same name as that of the inducing pole, and, moreover, that it is pretty evenly distributed over the mass of the bar; it is practically a magnet with a single pole. Similarly, the free electricity of the insulated conductor is plus and pretty evenly distributed. The actual facts are susceptible of simple and unequivocal demonstration. A compass-needle, when carried along the bar, or put in any position with reference to it, turns constantly to the bar with the same pole; iron filings are attracted all over its surface, etc. The condition of the electrical conductor may be shown by pith balls or other simple electroscopes. The facts as here stated concerning electricity might have been inferred from the ordinary theory. One kind of electricity attracts its opposite, but in the act or condition of attraction the electricities are of necessity bound in such a way that they cannot have any external influence; the external influence of the bound electricity implies a release which is inconsistent with its existence as induced electricity. The case of the induced magnet is of peculiar interest, because it makes it manifest that there is here a form of magnetism hitherto unrecognized, namely, magnetism—which moves and comport itself like a fluid. This induced magnetism, as to the rationale of its production, its distribution, and its disappearance, is so remarkably like induced static electricity as to suggest the probability that they will be found to be phases of the same thing. The facts here brought to light are related to the fundamental notions of electricity and magnetism, and it cannot be doubted that they will be of importance to science and the useful arts.

**GLACIAL PERIODS.**—Mr. H. B. Norton, in a recent lecture before the Kansas Academy of Science, gave some interesting calculations respecting the glacial epochs through which the North American continent has passed, based largely upon the theories of Croll and Geikie. In his closing paragraph he remarks: "It thus seems probable that there have been many glacial periods in each hemisphere, and that the ocean, like a mighty pendulum, vibrates from pole to pole through vast but regular periods. It is not necessary to suppose a cataclysm at the end of each period, as some of the earlier writers did; but rather an insensible drainage of waters, which so gradually submerges the land and pushes the human race before it as hardly to be perceptible in the course of generations, even uncovering new continents, and opening up fresh fields and pastures new to human industry, when the old are exhausted. The Southern hemisphere is now undergoing the slow refrigeration of its long winter. This began about 6,500 years ago; it will end about the year 4,870. It has passed its middle, but not its culmination, even as the greatest average cold of our ordinary winter is nearer the vernal equinox than the winter solstice. It is probable that 2,000 years from now the southern continents will be still more deeply deluged; the Antarctic ice-cap glaciers will have extended several hundred miles to the northward, and the glaciers which have already appeared among the Andes will have covered the plateaus of Patagonia and Chile. Nevertheless we need not expect that mankind will then witness the utmost possible degree of refrigeration, because the ellipticity of the earth's orbit is now less than it has been at certain periods in the past, and will be again in the remote future."

**DEFLECTIONS IN THERMOMETERS AND HYDROMETERS.**—In a recent number of *Comptes Rendus*, M. J. Salerni calls attention to deflections in thermometers and hydrometers if used for certain purposes. Changes in thermometers ranging as high as 8° to 10° occur at printing-ink works, where oils are heated for several days to 670°, in glycerine works and with rectifiers of beezol. Glasses are not only merely modified when heated to 300°; it undergoes true deformation at far lower temperatures. Thus, the hydrometers used in sugar works, which are often exposed for a considerable time to temperatures of 95°, are affected. After an immersion of some days they are completely modified, their weight decreases and they become erroneous to the extent of 7° to 8° B. The editor of the *Chemical News* adds that in many chemical works it has been found necessary to submit all hydrometers used for hot liquids to a weekly comparison with a standard instrument.

## The Water Supply of the Earth Diminishing.

It is probable that the earth is gradually losing her superficial water, or, in other words, is drying up. This inference, which seems to be well substantiated, has been drawn by many geologists, who have given special study to the metamorphoses which the rocks composing the earth's crust have undergone in the past, and are now undergoing.

It is generally assumed that the evaporation of the water from the surfaces of our oceans, lakes and rivers is balanced by the amount of various forms of aqueous precipitations—rain, hail, etc.—from the clouds, by which the water finds its way back again to the earth. This is strictly true in the sense that not a particle of water passes beyond the limits of our atmosphere, and that all that finds its way into the atmosphere by evaporation, sooner or later is returned again. Nevertheless, the water supply of the earth is slowly but steadily diminishing. It is not destroyed, but is so modified as to be no longer available for the sustenance of animal and vegetable life since it is absorbed and bound up in the rocks. This disappearance of water is accounted for partly by mechanical absorption; partly by the chemical union of water with the constituents of certain of the rocks, called hydration, and which is one of the phenomena generally attending the superficial weathering of the rocks; and partly by the crystallization and re-crystallization of many of the constituents of the rocks, and other extensive chemical changes going on at unknown depths in the bowels of the earth. In the course of time, though necessarily many ages from the present, it is argued, the combined result of these several causes of desiccation must be the complete absorption of the water, and its disappearance from the surface of the earth. The estimate has been made, though such an estimate can be little more than a guess, that one-seventeenth of the quantity of water with which the earth was originally provided, has already been bound up chemically in the rocks, or has been absorbed beyond the possible reach of the organisms living upon her surface.—*Ex.*

## Influences of Electricity on Vegetables.

Some months ago M. Grandean, director of the agricultural station at Nancy, announced that experiments made upon Indian corn and tobacco proved that atmospheric electricity exercises a very favorable influence on vegetation. M. Maundin, director of the National Botanical Garden of Antihedea, to-day makes known some facts which go to prove directly the opposite. He experimented on other plants and in other climate, and, as will be seen, he draws the conclusion that M. Grandean's inferences were too general. According to him, atmospheric electricity, like all other agents of vegetation, plays a useful part, but which, in its absence, can be replaced by another force. The experiment was made in the following manner: In a kitchen-garden bed, well exposed to the light, two squares of 51 decimeters each were selected at seven meters apart, and in each was planted a bunch of dwarf kidney beans, a lettuce, a tomato plant and two cotton seeds. One of the beds was left to itself and the other was covered with an iron cage, the four uprights of which terminated in points to attract all of the atmospheric electricity. For a fortnight the two cultures appeared to be alike, but at the end of this period a difference was observed between them, and the difference, which was to the advantage of the cage, kept increasing more and more. The bean plants under the cage were much better developed and much richer in seeds than those in the open air. As for the lettuce, its height in open air was one meter, and under the cage 1.20 meters; its total weight was 337 grammes in the open air, and 427 grammes under the cage. The tomato plant in the open air had attained a height of 0.8 of a meter, and under the cage, one meter; its weight in open air was 0.072 of a kilogramme, and under the cage 3.754 kilogrammes. While under the cage the plant bore 83 tomatoes, weighing 2.162 kilogrammes, the number on the plant in the open air was only 37, with a weight of 1.08 kilogrammes.—*La Nature.*

MR. EDISON has made a great many experiments to determine the most suitable material for the filament in his electric lamps, and as yet has been unable to find just what kind he wants. Cardboard failed, and now various woody fiber are being tried. Mr. Edison, it is said, finds that medullary rays, or the little lines seen in a cross section of exogenous woods, extending from the center to the bark, offer some obstruction to the free passage of the electric current. Pith also offers greater resistance to the current, so that different parts of the horse-hoe filament acquire varying degrees of brilliancy; and Mr. Edison is reported as saying that unless fiber can be obtained entirely free from pith, his lamp will remain imperfect. We understand he has sent a man to Brazil to find the pithless fiber, and it remains to be seen whether or not he succeeds in obtaining something sufficiently free from pith to answer the purpose.

A NEW coloring substance extracted from the wood of the heather or poplar directly by treatment with a hot solution of alum, obtains a liquid of a bright yellow color which deposits a greenish resin. It is called *Eriene*.

THE globular form of the earth was first suggested by Thales, of Miletus, about 610, B. C.

improved copper plates and other paraphernalia for a thorough test of the ore. If their expectations are realized, they are glad and determined the old Pochontas shall give a good account of herself.

**PROSPECTING.**—*Georgetown Gazette*, Jan. 22: Prospecting is unusually brisk along the divide this winter. We already hear of a number of new claims being taken up, and are long expected to treat our readers with some interesting mining strikes. We are glad to see this activity among prospectors. We understand that in not a few localities, prospectors are annoyed by parties claiming ground to which they have no legal title. No man has a right to hog it in this way over the prospector, and we would advise the prospector, where he has doubts about a man owning "the whole country," to test the legality of the matter should he find a favorable prospect.

**OTTER CREEK.**—There are quite a number of mines being operated this winter on the Otter Creek divide, with good prospects in sight. Mr. E. C. Cheek & Sons are running 2 claims, and several others are piping and ground-sluicing with good results. The Cal. W. & M. Co. have dug a new ditch and put the water on that ridge, which will be a great help toward developing some of the best mining country of this divide.

**F. KANTZ** is erecting new hoisting works at the Eureka mine. When completed they will be similar to the works at the Rosenbergs mine. The Eureka will then have the most complete pumping and hoisting gear of any mine on this divide.

Crack late rains have softened the ground so that miners will have to be cautious in their open cuts, or we may hear of more accidents.

**JOS. SWANEY** has sold out his one-half interest in the Barney hydraulic mine, which lies south of the noted Whiteside mine, to A. Baldwin and J. A. Wolf, who now become partners with Henry Jones in the mine. The new owners are favorably known as practical, go-ahead miners, and, judging from what we hear of the mine, they will make it pay handsomely.

**HARRY MOORE** is continuing driving away developing his Golden Fleece quartz claim, on Bald mountain. It looks better as he progresses.

**L. N. RECORD** is running a hydraulic on his claim, near the junction of Manhattan and Badger, with everything looking well.

**INYO.**

**LOOKOUT.**—*Cor. Independent*, Jan. 22: The Modoc furnace has been making a very successful run, under the management of J. J. Williams. Will turn out in the neighborhood of 100 tons of very rich bullion. The Secretary of the company has written to this place telling the Superintendent to keep 15 good men here, as they intend to resume prospecting as soon as the run is over. Frank F. Field and J. J. Williams are negotiating for a lease of the Minnetta mill, and, if they are successful, it will give employment to 15 men for 3 months. There is 100 tons of first-class ore, 100 tons of second-class and 2,200 tons of tailings. The Snow Canyon mine is running on tailings, and will crush ore inside of 10 days.

**MARIPOSA.**

**HAMBLETON MINE.**—*Mariposa Gazette*, Jan. 19: We understand that the 5-stamp mill recently erected upon the above mine is about ready to test the quality of rock produced therefrom, which previous assays have shown to be very rich in both gold and silver. This mine is located about 5 miles southeast of town on the waters of the Chowchilla, and is partially or wholly in the hands of new men, who are said to have sufficient capital to give the mine a fair test of its producing qualities.

**MONO.**

**BODIE ITEMS.**—*Free Press*, Jan. 19: At no time in the previous history of Bodie has the mines showed such a marked improvement all along the line in any one week as they did during the week ending with the 15th instant. The Syndicate is turning out a steady stream of bullion, the ore paying much better than was anticipated. The Tioga is crosscutting west on the 682 level, the crosscut being in 18 ft. The Standard has started a crosscut west on the 1,000 level, to cut the large veins which have yielded so enormously on the upper levels. These deep workings have taken most of the water from the 600 level of the Jupiter, and drained the Bodie entirely, so that sinking the main incline in the latter has been resumed in order to get water for steam purposes, and sinking will probably soon be resumed in the middle winze below the 6th level, which winze was abandoned on the 8th of September last on account of water. The bottom of this winze is in a vein 5 ft wide of high grade ore. The quality of the ore mined from this level has shown a marked improvement in quality, and a still further improvement is confidently expected this week. The Champion is driving south in a body of fine ore, which is steadily improving. The Jupiter will shortly crosscut east from the south drift, 600 level, to prospect an encouraging looking vein formation in that direction. The Goodshaw will commence hauling ore to the Miners' mill to-day, and has a large supply stored in the north drift from the main east crosscut, 600 level. Ore is being stored from the Easton vein (No. 20) in the Bodie tunnel, and this will be run through the Miners' mill as soon as 200 or 300 tons of Goodshaw ore can be run through. Work will not be resumed in the Oro until the Red Cloud shaft drains the water, as it would be an expensive piece of folly for Oro to start its pumps, as no work save pumping could be carried on before the Red Cloud gets to pumping from a depth below that attained by the Oro. The Silver Bell mill will start to-day, and the Spaulding mill will start on Spaulding ore about the end of the week. The ore breaks in the Spaulding are improving. The 500 level of the Noonday is opening up splendidly, and the resumption of work in a long abandoned winze in the east vein, below the 500, reveals the fact that that fine ore body is increasing in size and improving in quality of ore as depth is attained. Some drill holes run into the vein from the north drift, 300 level of Boston Co., shows the ore to be of a good milling quality, the drillings including the porphyry wall gone through—giving assays from \$15.14 to \$43.05.

**NEVADA.**

**THE WATER SUPPLY.**—*Nevada City Transcript*, Jan. 20: There is an abundance of water throughout the mining region to satisfy even the hydraulic claim owners, and the monitors are all kept busy. The South Yuba company are running 2,000 inches in their Chalk Bluff ditch, and 1,700 to Blue Tent. All the other ditches in the county are also full.

**D. T. HUGHES' CLAIM.**—Mr. Hughes is pushing matters as rapidly as possible in the opening up of his hydraulic claim at Blue Tent. H. S. Bradley has made the necessary survey for a ditch to convey water from the ridge ditch to his reservoir, which is being enlarged and improved, and when completed will give a sufficient fall for piping. Six weeks or two months will probably elapse before the mine will be ready to work, and then it is proposed to put on as large a force of men as can be employed to advantage, and the claim will be opened up without delay.

**PUMPS READY FOR WORK.**—*Grass Valley Union*, Jan. 20: The new 12-inch plunger pump has been put in place in the Ophir shaft, and is about ready to commence lifting the water. This pump reaches from the 6th to the 10th level. From the surface to the 6th level a 14-inch plunger is used. During the setting of the lower pump the water gained about 30 ft in the shaft, but did not rise as high as the 10th level. The 10th level 2 powerful pumps the mine will soon be drained, and no further difficulty will be experienced in holding the water.

**SCOTIA MINE.**—Owing to the heavy inflow of water in the Scotia mine, which the present machinery is unable to handle, the work at the mine has been discontinued until a larger engine and pump of sufficient capacity to handle the water can be set up. This will require some weeks, but no unnecessary delay will be made, and when operations are resumed the work will continue without further hindrance. The ledge in the bottom of the shaft is of good size and of excellent quality, and every confidence is felt that the Scotia is going to make a valuable mine.

**ALPHA MINE.**—In an item about the Alpha mine yesterday the types incorrectly stated that 19 ounces of amalgam were recently cleaned up for 12 working shifts, when they

should have said 90 ounces. The regular daily clean-up of amalgam at the Alpha is from 8 to 10 ounces.

**THE MASAZITA MINE.**—*Nevada City Transcript*, Jan. 25: The Masazita company's hydraulic claim in the northeast edge of the city is being worked to good advantage this winter under Mr. Gowell's superintendence. But 4 Chinamen are employed, the remainder of the 30 employed being white men. Two monitors are in operation day and night, using 1,400 inches of water, all of which is obtained from the company's new ditch, which heads at Scott's flat.

**A. EVANS' CLAIM.**—*The Eureka Bros.*, who are working on Deer creek near the Le Compton, have 6 or 7 tons of apparently rich ore now on the dump, and will soon have another crushing. These boys deserve credit for the perseverance they have displayed in opening up this claim, and there are older men now spending their time in croaking who ought to take a few lessons from them.

**PLUMAS.**

**GOTO STRIKE.**—*Greenville Bulletin*, Jan. 19: No new developments, but work is continuing steadily, so far as we have been able to ascertain.

**CURETTE.**—No hauling has been done at this mine since the commencement of the last severe storm, the roads being so bad as to render it impossible. It is expected that work will be resumed early next week. A new steel wire rope for hoisting purposes arrived last evening, and has been sent to the mine.

**ATLANTIC.**—At this mine the tunnel is now in a distance of 60 ft, and they expect to strike the ledge in a few days. Work is being pushed forward with energy.

**GREEN MOUNTAIN.**—An extra force of tenders was placed upon the ditch during the last storm, to watch the pipe and guard against breakages in the ditch. Only one occurred, which, by prompt attention, was soon repaired, and resulted in a delay of 10 hours. Up to the present there has been no further stoppage necessary, and the mills are running steadily. Continued good reports come from the property, and the owners have many reasons for congratulation. The face of No. 5 tunnel is advancing in good milling ore, which has continued to improve ever since the chimney was first encountered some weeks ago. All other portions of the mine are yielding ore abundantly, sufficient to keep the mills constantly supplied.

**GRANITE BASIN.**—*Plumas National*, Jan. 22: Mr. A. Swan reports everybody busy in this flourishing mining camp, and arrangements being made for very active work during the coming season. Mr. Swan brought us some fine specimens, one in particular, a boulder found in one of the ravines, which is filled with free gold, and is a beauty. With the introduction of the proper improvements and appliances for saving gold, the Granite Basin district will prove one of the richest in the country.

**SIERRA.**

**BLUE GRAVEL.**—*Mountain Messenger*, Jan. 22: The B. M. Ex. Co. have now run some distance in blue gravel. The tunnel has been all in gravel for the past week. Several carloads were washed last Tuesday and a prospect obtained. The gold is light and scaly, as would naturally be the case, as the bedrock is the tunnel now is. The indications seem to be very favorable.

**WATER.**—The Bald Mountain company has plenty of water to wash all the time now. They have washed out the small dump and made a large hole in the large one. The water will probably hold out long enough to clean-up that also.

**KENDALL & NOBLE** have bought the lot of mining ground on the hill north of the Catholic church, and will enlarge the ditch that carries water from Red Dog.

**FLORANCE.**—Work is being prosecuted on the Florence quartz ledge, situated on the ridge above Forest City. S. Stephenson and others are the owners.

**NORTHERN SIERRA.**—L. P. Sihley and Jacob Gross arrived from the northern part of the county Tuesday, and report a favorable condition of affairs in that rich mining district. They journeyed the entire distance on snowshoes, from Howland Flat to within 25 miles of town, via Fort Wint and the new ditch. They expected that water will be brought through the new ditch, down the St. Louis and up the Greenwood ridge, within a few days. The Bonanza company is doing handsomely. Out of 11 carloads of gravel last week was realized \$190. Liberty & Co., Port Wine, are hydraulicizing day and night; fair prospects of doing better than last year. Some work is being done at Morristown, but the frozen water seriously derates operations. A full head, sufficient for 2 monitors, is running at Eureka. Virginia company have their air shaft completed, and are taking out enough pay gravel to cover expenses. Expect dividends are the coming spring.

**TRINITY.**

**TAYLOR FLAT.**—*Trinity Journal*, Jan. 22: Trinity river visited the Taylor Flat mine last week and its mark on the way of damage. We also learn that the ditch slid, and there were some breaks in the flume; also that it will be 3 or 4 weeks before everything is in running order again.

**DAMAGE ON NEW RIVER.**—While the late freshet following the heavy rains of last week did but little damage in the northern portion of this county, the Lower Trinity and New River sections did not escape so fortunately. The damage done there, and in fact the only real disaster occurring in the county, was the complete destruction and carrying off of the fine new steam saw-mill only recently erected on New River, about 4 miles above the mouth of that stream, by the contractors who were building a ditch and flume for the New River hydraulic mining company. This mill, as we are informed by Mr. Robert H. Palmer, chief engineer, was one of the most complete and smoothest running saw-mills in the State. The machinery had all been packed to New River from Arcata, the boiler being made on the ground. The dam was 200 ft long, and the water poured over it fully 10 ft deep. It was just 7 minutes from the time it broke around the end of the dam until the mill was gone, together with the ground on which it stood and everything else within 40 ft of its site, including about 60,000 ft of lumber, 150,000 ft of logs and a number of bents ready framed for the flume and to be forwarded to the front. Damage was about \$20,000. A new mill will have to be built.

**NEVADA.**

**SIERRA NEVADA.**—*Gold Hill News*, Jan. 24: The incline upraise from the 2300 level to meet the vertical shaft at the 1700 level was advanced 30 ft during the week; total length, 430 ft. The south drift, between the 2400 and 2500 levels, is now in 64 ft south of the winze down from the 2400 to the 2500 level. During the week 71 tons and 200 lbs of ore were raised.

**OVERMAN.**—East drift, 2275 level, has been extended 20 ft; total length, 173 ft. Stopped drift on 18th inst. to drill with diamond drill to ascertain how far we can continue the drift without danger of being drowned out by the water. Have drilled 110 ft and cut a small stream of water 95 ft.

**CALIFORNIA.**—During the week 297 tons of ore have been extracted and sent to the mills; assay value, \$19,46.

**CON. VIRGINIA.**—During the past week 495 tons of ore have been extracted and sent to the mills; average assay, \$21.79.

**MEXICAN.**—On the 2500 level the joint Ophir east winze has been sunk and timbered 17 ft, and a tank-pit is being cut out at the 2600 level.

**OPHIR.**—On the 2500 level the joint Mexican east winze has been sunk and timbered 17 ft. Cutting out a tank-pit at the 2600 level.

**CALIFORNIA.**—Pumps have run an average of 14½ hours per day, consuming 6 cords of wood per day. Have completed repairs to drift on 1600 level. Porman shaft has been sunk and timbered 20 ft; total depth, 1,675 ft.

**UNION CO.**—On the 2500 level the joint Mexican west crosscut has been extended 15 ft, the joint Mexican east crosscut 29 ft, the joint Sierra Nevada east crosscut 52 ft, and drill hole No. 7 from the bottom of No. 1 winze has been extended 150 ft.

**UTAH.**—The east drift on the 2150 level has been extended 24 ft, the ground being soft.

**CANDELARIA DISTRICT.**

**NORTHERN BELLE.**—*True Fissure*, Jan. 15: The crosscut from the 4th level drift of the Northern Belle mine has been discontinued, and from the crosscut a drift has been started which has been extended 14 ft during the week in favorable looking formation, giving assays ranging from \$10 to \$25. There is no change of importance in the 3d level. The 1st and 2d levels look fully as well as at any time in the last few months. In the level above the adit all work has been productive of good results, especially in the 5th, 9th and 10th, where the ore stops look very promising. The roads are now in fine condition and the teams are hauling to the mills 35 tons of ore per day. Both mills are running steadily and doing good work. The regular monthly dividend of 60 cents per share has been declared payable to-day. The shipment of bullion for the January account to the 12th was \$33,330.83, and for the week ending same date \$20,643.35.

**ESMERALDA DISTRICT.**

**RECORDED STRIKE.**—*Esmeralda Herald*, Jan. 22: Rumors have been flying around for several days past that a rich body of ore had been uncovered in the Prospectus mine. Though the likelihood of such an occurrence taking place at any time is looked for by many, the present rumor is more than likely the result of the order given by the Superintendent prohibiting visitors from going through the mine.

**REAL DEL MONTE.**—Drifting is still continued on the 800 level. Work on the 575 tank station goes ahead. At this time there is an immense body of water being handled by the pump.

**EUREKA DISTRICT.**

**STRIKE.**—*Eureka Sentinel*, Jan. 19: There were many rumors upon the streets yesterday about the "Albion strike." The size of the body, the ore it is, etc., was all explained to the *Sentinel* reporter 2 or 3 different times during the day, and there were as many locations for the same as there were stories.

**MOUNT ROSE DISTRICT.**

**SPRING CITY.**—*Silver State*, Jan. 21: D. McPeters, who has been in business in Spring City almost since the organization of Mount Rose district, is in town. He says the snow is 3 ft deep in town and much deeper on the mountains, where it has drifted to a depth of 10 or 12 ft in many places. The Bullion of Paradise company, has resumed operations at their mill, but they experience much difficulty in getting ore from the mine, in consequence of the almost impassable condition of the roads. He thinks that during the City will be a lively place again next spring, when the Paradise Valley and other companies will resume work. He has no doubt of the richness and permanency of the mines of the district.

**TAYLOR DISTRICT.**

**ONE.**—*Ward Reiter*, Jan. 22: W. N. McOill, who was in Taylor district last week, estimates that there are 1,500 tons of milling ore in sight in the Prince mine, in that district, owned by Robert Briggs and W. O. Lyons. This will be a comfortable starter for the mill to be erected on the headwaters of Steptoe creek next spring. This, together with ores from other mines in the district, will keep the mill running without fail.

**TRINITY DISTRICT.**

**MORNING STAR.**—*Silver State*, Jan. 21: We are informed that the purchasers of the Humboldt Irrigation & Development Company's canal, at Orona, are negotiating for the purchase of the Morning Star mine, in Trinity district. The Morning Star is an extension of the Evening Star, which produced hundreds of thousands of dollars in early days from ores extracted above water level, but which was abandoned when water was encountered in the works. The ledge is located in a syenitic formation, and the ores are rich in gold and silver. It is situated in the Trinity mountains, about 8 miles west of Orona.

**TYBO DISTRICT.**

**RENNING.**—*Cor. Belmont Courier*, Jan. 19: The Tybo Co. mining company's mill is running steadily with good results. The 2-G mine is sending forth its regular supply of ore, and Mr. Frank Newell, who resigned his position as foreman on the 5th inst., says the mine looks well, there being enough ore in sight to keep the mill running for years to come, and everything is running smoothly under the new administration of Mr. J. E. Norris, who succeeds Mr. Newell as foreman of the 2-G mine. Mr. Luse has struck a fine ledge of ore, and before long the Independence will realize a handsome fortune to its owners.

**ARIZONA.**

**GLOBE NEWS.**—*Silver Belt*, Jan. 15: Work is still going on at the Red Rover, under the direction of Messrs. Vail & Hayse. Mr. Vail reports, after 3 weeks prospecting and assaying, that the property far exceeds his expectations. He is continually finding something new and unexpected. He is now staking ore in the dump that will not only pay all expenses, but a profit besides. It is reported that D. O. Chilson has bonded a group of mines near the Blue Bird mine of the Messrs. Middleton. The Mack Morris mine is yielding, without stopping, a sufficiency of ore to keep the Arizona Mexican mill constantly in motion. The tunnel of the La Plata is yielding same character of ore as taken from the Mack Morris. The Emazetta mine has had 2 shafts, 125 and 50 ft, and 200 ft of drifts opened since August. Ore very similar to that of the King. Bollinger, of Mineral creek, who has opened a really fine ledge of copper ore there, has written to a friend in this place that his "machinery is at Casa Grande, and will be smelting copper ore in 60 days." We have spoken of this ledge in a former number, and then as now, regard it as an extraordinary fine property. The Fame mine, in charge of Fred Medler, is yielding fine ore, which will be worked in the Champion mill. An assessment was being done on the Vallada mine, a blind ledge was struck which had the appearance of being a valuable one, both as to quality and quantity of ore. The Champion mill is reducing ore from the Champion mine. The Golden Eagle mill and mining company paid off Wednesday.

The King mine is still King, and, as sunk upon, improves as depth is attained. At 500 ft the vein of ore is 81 ft in width, and all bears a sufficiency of silver to warrant in being worked. The mine is in good shape, and the magnitude of the output can be imagined when the dump is estimated as showing more ore than the present capacity of the works can reduce in 3 years; but fortunately the company is progressive, and have ordered efficient additional machinery to insure the reduction of 75 tons of ore daily. Seventy-five tons, although seemingly large, is a mere medium of what the mine is capable of yielding. Its capacity is only commensurate with the number of tons of ore that can be raised from it, by improved machinery. Had this deposit of ore come under Mendoza's explorers observation, 3 centuries ago, they would not have been withdrawn by his order from what is now known as Arizona, because of the want of a sufficiency of silver to satisfy Spanish cupidity. The King mine is simply wonderful, and when better known it will be regarded as dwarfing the best of the Nevada bonanzas in their palmy days.

**IDAHO.**

**IREMS.**—*Yankee Fork Herald*, Jan. 18: Challis has largely improved in business since the introduction of capital into the mining districts surrounding her. Trade with the mining camps has been good all fall and winter, and more large business houses will be erected early in the spring. Nearly all of the prominent mines in the district are working, and the portion of the mineral belt are being worked this winter. Vast quantities of high grade ore are accumulating on the dump, and universal activity is being displayed all along the mineral range. The Ramsborn shows much high grade ore. The Redemption Co. has 6 men at work taking out ore, and is keeping up its reputation as a producer of first-class ore. The Silver Bell has been sending ore, for months past, to the Klaminick reduction works. The Gunter is getting coal and ore on hand for early spring operations.

**SQUAW CREEK.**—The mines on Squaw creek are developing even better than was expected. Several companies are getting out ore, and a number of the ledges are beginning to show horn and native silver in quantity. Cal.

Kirk's mine, located last summer, is 40 ft wide, and in this are streaks of very high grade ore. The Red Bird mine, on Squaw creek, owned by the Salmon River Mining and Smelting Co., of Omaha, continues its extraordinary yield—over 20 ft—and much ore is accumulating on the dumps.

**MONTANA.**

**ALTA-MONTANA.**—*Helena Independent*, Jan. 18: For the first 8 days of this month the average daily output from this mine has been about 40,000 lbs that assays 145 ounces of silver per ton. The slopes in the levels are all in good ore end are being rapidly extended. Already in the 2 lower levels, one of which is 500 ft down from the surface openings, the stoping ground covers a distance of 565 ft, beside the new ore body found in the crosscut, which is opening out with great promise. The daily bullion product is 5,794 lbs, and the last car-load, just weighed, carries 355.60 ounces of silver, besides \$95 gold per ton.

**THE ALMON.**—This mine has only been able to work through the small mill, at Mt. Pleasant, about 400 tons of their ore. They have 200 tons still in the mill, and a vein, now 10 ft wide, that has thus far yielded not less than about \$50 gold per ton.

**BONANZA CHIEF.**—The shaft on this mine is now down about 80 ft, and the ore body is uniform, and free gold is shown at the deepest point reached.

**THE ROADWAY.**—*Silver Star*. This famous old mine is still making a history that would be of no little mining region. Their mill has run for years, and never a single month without paying a profit. After these years of endeavor "to dig it out," the report comes that the ore is boundless. It is not high grade, but very free.

**THE HECLA CO.**—It is rumored that this company has sold out their works and mines to the old Telegraph Co. for \$2,000,000.

**THE MONTANA COPPER CO.** of Butte, have just bought a claim on the Burlington lot for \$35,000. This company is now treating 25 tons of copper ore per day, and will soon quadruple their capacity. They have 3 large reverberators and 1 matte furnace running, and are building another matte and a blast furnace. The ores treated average only 12% to 14% copper, but by means of their 4 jigs and 2 Froe carriers, they make 5 tons of matte per day, now, they carry 55% copper when shipped. They will soon be making 20 tons per day.

**THE DEER LODGE.**—Patrick Senno and John O'Brien are sinking the shaft on this old 50 ft deeper, when levels will be run for exploration. A few which has been built and the mine put in thorough order for work.

**THE ONLY CHANCE.** of Highland, Deer Lodge county, has been successfully worked, though with very crude and meager appliances, for a number of years. Messrs. Eddy and Grenier have recently made an examination of the property for Eastern parties, who contemplate purchasing it and putting it into first-class working order. A 20-stamp mill, hoisting works and every available kind of machinery requisite to render it perfect in its operation will be furnished as soon as the weather will permit of transportation.

The Bluebird mine, of Mt. Pleasant, which has always produced ore of a high grade, is now opened by a drift from the 100 level on the Hickey for a distance of 75 ft past the main boundary line, and an ore body 7 ft wide is exposed which is said to run \$40 per ton in the mill.

The Hickey shaft is over 225 ft deep, and the old chute of pay continues and has widened out to 10 ft. The average in this mine has never been under \$30, and the last clean-up from 100 tons of the ore, run under 5 stamps, averaged nearly \$35.

The Little Jennie shipped to the Alta-Montana works 2,450 lbs of ore that carried 202.39 ounces of silver, 14,140 lbs, the yielding 107.32 ounces per ton; and recently from the dump of second-class ore, which is said to contain 1,400 tons, 23 tons that averaged 102 ounces of silver per ton—and the remainder is said to be as good.

**PHILIPSBURG ITEMS.**—*New Northwest*, Jan. 21: There are 17 men at work on the Granite Mountain ledge, which was lately bonded by Mr. Charles Clark for \$400,000 from Holland & Estill. One tunnel of 100 ft run along the ledge shows an average width of 4 ft, going as high as \$170 to 100 ft of silver. A shaft is down on the vein 60 ft, with 6 ft of ore at the bottom. Another tunnel is in 73 ft. Negotiations are said to be pending with Mr. Clark for a 4 years' lease of the Northwestern mine. It is also rumored that the Hope M. Co. contemplate erecting in the coming season a 20 stamp mill, with a roaster for treating the base ores of the Cliff mine. The new hoisting works at the Algonquin mine will be finished in a few days, when stoping will begin on the 340 level. Steam hoisting works are being put on the Salmon mine east spring, which works when employed will employ 3 men to where there is 1 employed now, and there are 120 men in the company's employ.

**NEW MEXICO.**

**STAKE BY THE CARROLLTON CO.**—*Grant County Herald*, Jan. 22: On the Old Firm the vein the first struck was about the width of a knife blade, but as they descended it gradually widened until it reached an extent of 3 ft, and continues widening as they go down. The lowest assay was \$100 in gold, and the highest \$3,000, with 10 to 30 ounces in silver, although pieces could be picked out that will triple these figures.

The Carrollton mill is rapidly progressing under the superintendence of Capt. West, who is working 20 men. The frames for the pans and settlers are completed, and are a very solid piece of workmanship. The concentrators are already set, and the greater part of the machinery is on the ground. The completion is now only a question of a few weeks, and will be boded with delight by the miners of Grant county. A custom mill has been our greatest need for years, at last we have obtained it.

**OREGON.**

**HYDRAULIC.**—*Oregon Sentinel*, Jan. 15: Sam Lackland is making the dirt fly with the hydraulic pipe in the Star Oulch claim, on Applegate, and deserves a big clean-up.

**TOM KATHER** is busy delving in his claim, at Fort Lane, having ample water and fully expecting another harvest of rich pieces.

The recent heavy rains have started the water in every mining camp and given an impetus to mining industry that promises a rich gold harvest in the coming season. The Centennial mine, near Willow Springs, is now under the superintendence of David Benner, and is being worked with a full head of water.

**KITPEL & KEATON**, on Poorman's creek, are rushing dirt through their flume with an immense head of water, and say that their prospects are excellent.

**ORE** has been discovered opposite Kerbyville, supposed to contain silver. It is not so far away as the dollar of our dimes, and probably contains more iron than anything else.

The Sterling, English Co., Blue Gravel, Applegate and all other large hydraulic mines in this and Josephine county, are now running with full heads of water and good prospects of continuance.

**FRANK ENNIS** is authority for the statement that Green Bros., of Onice creek, are now taking out richer gold-bearing rock from the Sugar Pine ledge than it has ever yielded before. These gentlemen are running their arrastras steadily and evidently have a profitable mine.

**UTAH.**

**CITY ROCKS.**—*Salt Lake Tribune*, Jan. 20: The miners at City Rocks were not visited by slides, and work is going ahead as usual at that mine. From American Fork report the canyon full of slides, some tall enough to cover the Walker horse. On Wednesday last 4 improved Ingersoll steam drills were shipped from New York for the Moulton mine.

The late strike in the Rebellion mine, Thayne's canyon, has created great excitement among the owners of property in that part of the Park country.

The owners of the Bingham Black Rock tunnel are said to be making money. Since the completion of the new shaft, they have struck rich pay gravel, which is panning out well.

This recent strike in the Moulton is widening as depth is attained. This is an agreeable surprise to the company, as they did not anticipate striking ore till the 200 level had been reached.

### Our Coast Steamship Trade.

The coasting business of this State, Oregon and Washington, which was formerly done almost entirely by sailing vessels, is now done mainly by steamers, the coasting schooners decreasing as the steamers increase. And this is especially the case on the coast south of San Francisco. The railroads have taken some of the trade, it is true, but it is mainly done by the steamers of the Pacific Coast Steamship Company, which stop at all available points on the coast. The southern coast route is a smooth and pleasant one as a general thing, the winds being light and sea smooth in summer, and the greater part of the winter.

Our northern coast, however, is very different. As we go north from San Francisco the winds grow stronger and the seas are heavier. During the summer months, when the trade winds prevail, the northern trip is apt to be rough, but the Pacific Coast Steamship Company have provided vessels built specially for the trade and constructed with great strength, so as to be both comfortable and safe. The trade to Oregon grew gradually so great that the company found it necessary to have built for that trade a first-class iron steamer, fitted with all modern appliances and conveniences.

This steamer we give an engraving of on this page, so that our readers will have a good idea of the class of vessels used for the northern coast trade. Her name is the *State of California*. She is 315 ft. long, 37 ft. 3 inches beam and 26 ft. depth of hold. She is registered at Lloyd's as A1 for 20 years. This ship, built at an expense of \$350,000, is probably as complete in her appointments as any afloat in American waters. From the hinges of the doors to one of the most powerful engines, there is not a place where the latest inventions in mechanics and navigation are wanting.

Among those which combine the useful with the beautiful is the folding berth, whereby a family or party engaging two state-rooms, can use one as a sleeping and the other as a sitting room. By a shifting of bed boards, a state-room containing three berths can be reduced to two, or vice versa, thus making its cabin-passenger capacity 200, and as many on deck. Another noteworthy change is the substitution of a revolving chair for the old style—something that will, doubtless, be appreciated by persons given to sea sickness on the slightest provocation. There are 63 passenger state-rooms, seven of which are folding. The dining-room is 40 ft. long by 34 ft. wide, and "Social hall," or the sitting-room on the "next floor," 24 by 40, finished in French walnut, bird's eye maple and Hungarian ash. But, perhaps, that innovation on the ship which is most useful and has more than a local bearing is the adoption of the electric light. When to the intensity is added its penetrating quality—the power to light up the densest fog—its importance is plainly perceptible. Not the least of the valuable adjuncts of the ship is its fore and aft water-tight compartments, by which the vessel may be lightened; the splendid apparatus for extinguishing fire; the improved davits for lowering lifeboats with speed and accuracy; the iron masts, which are used for ventilators, and steam-steering gear of the latest manufacture. She has one compound, direct-acting, inverted surface-condensing engine, high-pressure cylinder, 43 inches in diameter; low pressure, 73 inches each, 51 inches stroke, capable of developing 2,000 indicated horse power; six return tubular, with a capacity of 80 lbs. per square inch.

This fine steamer has registered 14 knots an hour several times. She is fitted with all the appliances for handling freight quickly and conveniently.

**UNDERGROUND SURVEY.**—R. H. Stretch, geologist and mineralogist, is making a most careful and exhaustive survey and examination of the lower levels of the Comstock for the Clarence King report. Mr. Stretch is familiar with all the upper sections of the lode, having thoroughly examined and carefully mapped them for Mr. King's former work, published by the United States Government. He also made frequent examinations of the mines at the time when he held the office of State Mineralogist of Nevada. Mr. Stretch is one of the most thorough and careful workers ever seen in the lower levels. Even the miners are surprised at his powers of endurance and his persistency in the pursuit of an object. In his present work Mr. Stretch will be able to show some curious changes that have taken place in the structure of rock formations with depth. In this he will be greatly assisted by sections carefully prepared from microscopical slides. From these, beautiful and instructive colored plates will be prepared.

THERE are 11 mining locations in this State named after President-elect Garfield.

WIRE cables for the C. & C. shaft cost \$3,412 last year.

### License Collections and Mining Stock Certificate Tax.

The following letter and memorandum, relating to the stock-certificate tax and expenses of collecting the same has been forwarded to Sacramento by License Collector Sinton:

SAN FRANCISCO, January 19, 1881.

Hon. Joseph Watson, Sacramento City—DEAR SIR: Inclosed please find memorandum of all collections under the ten-cent tax on stock certificates, from date of operation to let of January inst.

You will observe the steady decrease during the last two years and the collections thus far in this quarter indicate a still further decrease.

The whole matter, as to amount, depends entirely on the condition or activity of the stock market, and, while the decrease may be great, the expense attending the collection remains necessarily the same for the reason that the same time and labor is required to collect 10 cents from a company as \$10. The same papers, affidavits, calls on secretaries, entries in books, etc., including stationery, being the same in both cases; then the number of corporations is on the constant increase, so that I do not readily see how the expense can be reduced. There are now between 8,000 and 9,000 corporations to be examined and more or less collected from those who pay every three months, while those who do not pay anything one quarter may do so the next, and hence, require the same labor and looking after. The expense is at present and has been all along, two clerks, at \$1,500 each, \$3,000; stationery (about), \$500; total, \$3,500.

The following is a memorandum showing all collections arising from the 10-cent stock certificate tax, from the date of operation of the law,

spring to the Great Basin company's boarding-house.

The Great Basin mining and smelting company, of which Gen. P. E. Connor is managing director, have a smelter in Stockton. At present they have one stack in operation, reducing about 25 tons of ore per day; turning out about five and one-half tons of bullion, which runs 100 ounces per ton. The company also have concentrating works which reduce about 100 tons of ore per day to 20 tons of concentration by the wet process. This company, which is a Boston incorporation, is an able one, and all the best appliances are being introduced for operating their mines and works.

### Sulphur in Sulphides and in Coal and Coke.

The following paper by Thos. M. Drown, M. D., of Lafayette College, Easton, Pa., was read at a recent meeting of the American Institute of Mining Engineers:

The use of bromine as an oxidizing agent, particularly for sulphur, has become very general in analysis, replacing the stronger oxidizing acids. The object of this paper is to describe briefly the experiences which we have gained with this reagent in the laboratory of Lafayette College in the oxidation of metallic sulphides.

Most of the simple sulphides, as blende, pyrite, etc., when exposed to the combined action of an alkaline hydrate and bromine, and finally to hydrochloric acid, are completely and promptly dissolved. The procedure is as follows: The very finely pulverized mineral is first treated, in a beaker, with a solution of sodium hydrate of a specific gravity of 1.23, and heated; bromine is then cautiously added to supersaturation, and finally hydrochloric acid to acid reaction. If any of the sulphide is not taken up,

more sulphur. On combustion, however, or by complete oxidation, either by oxidizing acids or by fusion, additional sulphur may be obtained, which must represent that combined organically with the coal.

The following are some of the results obtained by Mr. Shimer from bituminous coals by the bromine method. The amount usually taken for analysis was between one and two grams:

Bituminous coals.	Total sulphur by fusion with alkaline carbonates and nitrates.	Sulphur by bromine process.
I.	0.43	0.035 0.035 0.035
II.	2.16 2.17	1.800 1.810 1.810 1.830 1.840 1.850 1.870
III.	1.17 1.18	0.710 0.713 0.717
IV.	1.43 1.49 1.50	1.098 1.098 1.100 1.100

In comparing the bromine method with others it was found that the treatment with hydrochloric acid and potassium chlorate gave on coal with but little sulphur in the form of pyrite the same results, but on coal with much pyrite the results were decidedly lower than by the bromine method. But too few experiments were tried on this point to be decisive. The action of nitric acid and potassium chlorate depends upon the nature of the coal. Some coals are converted partly into a brown unmanageable solution, and others are oxidized completely to a clear solution. In the latter case, of course, the total sulphur could be obtained.

As was said above, the sulphur obtained by the bromine method represents both the sulphides and sulphates in the coal. The methods ordinarily given for the separate determination of calcium sulphate are faulty. Sodium carbonate readily attacks pyrite, and dilute hydrochloric acid and even water, when heated for some time in contact with pyrite, with access of air, contain notable quantities of sulphuric acid. It would seem, therefore, necessary to dissolve out the calcium sulphate by means of water with the careful exclusion of air.

The determination of the total sulphur in coal by means of fusion with alkaline carbonates and nitrates, or chlorates, I find unsatisfactory, owing, I think, to the large amount of salts in the solution in which the barium sulphate is precipitated. A much better method is to burn the coal in a platinum boat placed in a glass tube in a current of oxygen. The products of combustion may be absorbed by a solution of bromine in hydrochloric acid, or by a dilute solution of potassium permanganate. The latter, I have satisfied myself, gives equally good results with the bromine. It is absolutely necessary, in this process, as originally pointed out by Muck,\* that the combustion-tube should be washed out with water after the completion of the combustion, since sulphuric anhydride condenses in considerable quantity in the tube beyond the boat. It is further necessary, of course, to fume the residual ash with alkaline carbonate to determine the sulphur which has not been volatilized by the combustion.

I have in progress an interesting investigation on the effect of coking on the sulphur in coal, to determine what influence the nature of the sulphur—whether in combination with iron as pyrite or organically combined with the coal—has on its elimination in coking. These results must, however, be reserved for a future communication.

\*Fresenius, Zeitschrift, xiv, 16.

THE freezing of the water in the waste ditch of the Lundy reduction works, says the *Home Index*, has given so much trouble that it has been decided to substitute steam for water power during the winter months. An engine has been ordered, which will arrive in a few days. The ore worked so far has yielded a high percentage, and everything indicates that the process is an unqualified success.

THE Graphic says: Trouble is anticipated by gold and silver mining companies incorporated in this State. All dividends during the year preceding November 1st, 1880, which amounted to more than 6% on the nominal capital, will be subject to a tax of 1 mill for every 1% dividend. Under this law Chrysolite will have to pay \$27,500. Many other companies will have to pay a large tax.

COAL fields near San Antonio, Socorro county, N. M. T., are said to be awaiting only capital to bring rich development.

THE Con. Virginia mine spent for the C. & C. shaft alone last year the sum of \$14,093 for candles and \$16,975 for ice.

THE STEAMSHIP "STATE OF CALIFORNIA"

April 1, 1878, to October 1, 1880, with the appropriations of the same:

For 3 months ending July 1, '78.....	\$4,279.00
For 3 months ending October 1, '78.....	9,355.00
For 3 months ending January 1, '79.....	8,372.00
For 3 months ending April 1, '79.....	6,428.00
For 3 months ending July 1, '79.....	8,400.00
For 3 months ending October 1, '79.....	6,738.00
For 3 months ending January 1, '80.....	6,583.30

The above all went to the general fund of the city and county: With the year 1880 began the payments, according to law, to the Mining Bureau.

First quarter, to Mining Bureau.....	\$1,341.60
First quarter, to city and county.....	4,903.10
Second quarter, to Mining Bureau.....	3,920.60
Second quarter, to city and county.....	130.40
Third quarter, to Mining Bureau.....	3,622.70
Third quarter, to city and county.....	175.90

The total collections from July 1, 1878, to January 1, 1881, were \$64,201.10. The collections for the quarter ending January 1, 1881, are now being made.

### Stockton Mines, Utah.

The Great Basin mine is owned by a stock company, with Gen. P. E. Connor as managing director. This famous mine is situated on Mineral Hill. The average yield per day in this mine is about 25 tons of good merchantable ore, besides about 40 tons of jigging ore, with present facilities for hoisting. This can and will be greatly increased when the large combination shaft is completed, which is now down 80 ft., with its powerful machinery, which is now in progress of erection.

The company has, in close proximity, concentrating works which are in full blast. Eight tons per day can easily be run through the eight sets of jigging and concentrated. The supply of water is furnished by a four-inch galvanized pipe, which is laid for a distance of about six miles. The concentrating works are lighted by two electric lights, which are a great saving in such a large building. Besides the enormous length of four-inch pipe, there are 8,000 ft. of two and a half inch, laid from the

same operation may be repeated. It is necessary, however, that the mineral be very finely pulverized. Instead of using the pure bromine, a saturated solution of bromine in potassium bromide may be used with equally good effect.

The process is advantageously simplified by making a saturated solution of bromine in the concentrated alkali. This is done by pouring bromine into a solution of sodium hydrate of the above given specific gravity, until no more is taken up, and then adding a little of the sodium hydrate solution until the liquid does not give off free bromine. The procedure with this solution is as follows: The pulverized mineral is moistened with, say, 10 cc. of the solution, and heated, then hydrochloric acid added to just acid reaction. Two more additions of the alkaline solution, in amounts of 20 cc. each, are added at intervals of about 10 minutes, each addition being followed by hydrochloric acid. The total amount of alkaline solution (containing the bromine) used is, therefore, 50 cc., and the amount of hydrochloric acid should not exceed that necessary to make the solution acid after each addition of the alkali. The mixture should be kept hot. After the final addition of acid, the contents of the beaker is taken to dryness and heated in an air-bath to 100° to 115° C., to render silica insoluble. The dry mass is then taken up by hydrochloric acid and, after filtration, the sulphuric acid is precipitated by barium chloride. In a sample of copper pyrites Mr. F. E. Bachman obtained, in duplicate analyses, 34.05% and 34.12% sulphur; in zinc-blende 32.97% and 33.09%. In another sample of blende Mr. P. W. Shimer obtained 32.71%.

This method of determining sulphur I find especially valuable in the analysis of coal. By the treatment of coal as above described results are obtained which agree very closely. The coal, as such, is not attacked, and the sulphur obtained, therefore, represents that existing in the coal as pyrite, and also as soluble sulphates. The residue left by this treatment has been subjected again to the same process, and yields no

## The State Line Mine.

The Gold Mountain county, after lying apparently quiescent for a number of years, is just now looming into considerable prominence, on account of the extensive operations on the old State Line mine by a New York and Nevada company. From T. F. A. Connelly, who has just returned from Gold Mountain, we learn the following interesting points:

This mine is located in Nevada, about 7 miles from the eastern boundary line of this State, and is situated near the dividing line between Esmeralda and Nye counties, Nev. The route from Independence is via Big Pine and Deep Spring valley, thence to Lida valley and Gold Mountain—a distance of 115 miles. On an air line the State Line mine is a little north of east about 50 miles distant from Independence. If Gold Mountain is to have a boom, and a thriving mining town should grow up there—of which there seems but little doubt—we would urge our business men to investigate the practicability of building a road from the head of Mazurka canyon to that point.

About 150 men are now in the camp, some of them engaged in laying out a town, though a large majority are simply waiting for the company to commence active operations. But little work is being done at the present time, except grading for the mills. Some of the machinery is already on the ground, but it will probably be two months before enough has arrived, together with lumber, to commence building.

Two 40-stamp mills will be erected, on the same site. Water will be brought a distance of about 13 miles, the company having ordered 65,000 ft. of 6-inch iron pipe for this purpose. The cost of these works will be about \$80,000. Mr. J. M. Taylor is acting as manager for the company, and Dr. Garvin as superintendent. The company is said to have been organized in New York city, and over \$500,000 will be expended before any returns are expected. The round sum of \$100,000 was paid for the mine by the present owners. The State Line ledge is in a granite formation, and shows huge quartz croppings for a distance of about 100,000 ft. Five shafts have been sunk on the vein, to a depth varying from 15 to 80 ft. The ledge in the bottom of these shafts shows an average width of 11 ft. The ore is a healthy-looking, whitish quartz, streaked and spotted with iron oxide. The gold can be seen in some of the samples brought in, and probably a large percentage of that metal is in a free condition. Assays of the ore vary from \$10 to \$100 a ton, and the average is presumed to be about \$30. According to reported measurements there is now nearly \$2,000,000 worth of ore in sight in the mine, and there is every reason to believe that further development will show almost inexhaustible supplies for the mill.—*Inyo Independent.*

## California District, Arizona.

A correspondent of the *Arizona Citizen* writes from Galeyville as follows: The 19th of last October the first pick was struck on the most important mine of this camp. Tents and camp fires were scattered along each bank of Turkey creek, and although many people had mining locations all over the hills, made upon the appearance of croppings, which indicated a ledge, still none had commenced the work of development. Now, in the short time elapsed, the Texas company have opened up one of the finest mines in the Chiricahua mountains, and others in this district, profiting by their experience, have commenced working their prospects to as great an extent as their means will allow. Already many men of capital have turned their attention in this direction, and have made many investments, buying claims at a reasonable figure, which in every instance has proved a profitable investment for the purchaser.

The Texas mine is the only one which has been developed to any extent, and the developments on this claim have surpassed the expectations of even its owners. A shaft 120 ft. has been sunk, and drifts have been made at several places. A cut was made on the surface near the shaft, and from this three tunnels have been run in upon the ledge, and ore has been taken out from every excavation which has been made. A tunnel has also been started in the side of the hill, about 400 ft. from the mouth of the shaft, which will connect with the shaft at the depth of over 200 ft., so it is plain to be seen that the mine is situated upon a steep hill, and may be worked easily. The company also own several other claims, which are extensions of and adjacent to the Texas, which may prove equally as good when developed. A smelter has also been purchased, and in a short time will be in successful operation. About 700 tons of ore are upon the dump, which will work at least \$100 per ton, so success is already ensured, as the ore on the dump will more than pay for the mines and the smelter.

The property is owned principally by Pennsylvania men, who have already come to the conclusion that mining in Arizona is a decided improvement upon the oil business in their native State. A description of the many other claims upon which work is being done would require too much space.

A well organized company will thoroughly prospect the Santa Cruz mountains for coal deposits, commencing in the spring. It is the belief that large supplies of coal must lie contiguous to the oil regions of that section.

## USEFUL INFORMATION.

## Dyeing.

The following may be found useful in dye, chemical, or other works, to prevent vats from being spoiled by acid liquors, and the process can be usefully applied to wooden vats for fermentation. The vats or casks after having been dried in the air are reversed on a clear fire of red-hot cinders, and left there till the interior surfaces has become warm, when paraffine is applied by means of a brush; 2 lbs. of paraffine are said to be enough for a vat of 300 to 400 gallons. Fermentation vats treated by this method are said to be easily cleaned, and after two or three years' use they only require to be warmed internally to be useful again.

Very often the dyes of woolen cloths are blamed for the rubbing off of the pieces dyed in the indigo vat without reason, while in many cases this is caused by the ignorance of some fullers who perform the fulling on pieces which have not been perfectly washed previously. Every indigo-dyed piece after dyeing will hold some loose indigo which has not been fixed on the fiber, and which, if not removed by thorough washing, will in the fulling process with oil, soap and lime, form an insoluble compound which is very difficult to remove in washing afterwards. The pieces must, therefore, be washed before, and they must not be kept too long in the dirty soap water. Another cause of the rubbing is the soap itself, which is too often adulterated with starch, or has been manufactured out of inferior substances.

A NEW IMPLEMENT.—From *Design and Work* we take the description of a new implement called the Burgoyne which is a curious combination of tools required for use in military operations. The implement derives its name from the late Sir John Burgoyne, and consists of a spade and pick combined in one handle, the shape of the spade being determined by the consideration of a diversity of uses in largely different material. The spade in this particular implement is of a semi-circular form upon the edge or cutting point, is flat instead of being curved spoon fashion, and is claimed to be adapted for use as an ax, and can be readily used for cutting down hedges and undergrowth. The handle of this implement carries an auger, while the spade end, at will, can be turned by a little change into a balance blade, the other end of which is a pick with a single point. This pick point is also capable of being arranged in line with the handle for use as a crowbar, while another and novel use of it is in sticking the pick end into the ground, allowing the spade end or blade to be above the ground, behind which the soldier, lying upon the ground, uses a hole made in the spade end through which to shoot, his head being protected from direct fire by the blade of the spade. The description is an abstract of a paper read by Mr. Stewart Harrison to the London Volunteer Engineers.

TO DYE STRAW BLACK.—Add to a soda or potash lye a gluten solution (which has been left 24 hours to dissolve), and when the whole is well mixed filter and put the straw in the filtrate and leave for 12 hours. The straw loses its fatty substances and takes the dye better. When the straw is dry it is put into a solution of nitro-sulphate of iron and left for 12 hours and then taken out and dried. A decoction of logwood is now prepared, and the straw brought into it after some decoction of galls or sumach has been added. A small quantity of hichrome completes the development of the colors. For giving the necessary brilliancy to the straw use gum or gelatine, and rub with a woolen cloth and a little oil, then rub it again with a clean cloth to remove the oil.

LIGHT AND RESPIRATION OF SEEDS.—At a recent meeting of the French Academy of Sciences M. Panchon described his experiments on the influence of light on the respiration of seeds during germination. The experiments were made with the seeds of the castor-oil plant and haricot bean, and the general conclusions are established that for a given quantity of oxygen absorbed the seed placed in darkness exhales more carbonic acid than that kept in light, while in light there is always less carbonic acid exhaled than oxygen absorbed, the contrary being the case in darkness.

NEW WELDING PROCESS.—Krupp has recently taken out a German patent for a new process of welding tubes and tires. He draws the tube on a pair of ordinary rolls, and heats the whole length of the portions which are to be welded in a portable fire-hox, into which air is blown, so that the heat is directed against the weld. After the necessary heat is obtained, the rolls are set in motion, and the plate which is to be welded is repeatedly drawn through them.

CEMENTING LABELS TO METAL.—For attaching labels to tin and other bright metallic surfaces, first rub the surface with a mixture of muriatic acid and alcohol; then apply the label with a very thin coating of the paste and it will adhere most as well as on glass.—*Amateur's Handbook.*

EXPANSION AND CONTRACTION.—According to the researches of Prof. Quincke, the change of volume of solid and liquid bodies when subjected to electrical forces is not due to heat, the change of volume of fatty oils being one of contraction.

## Tanning in China.

The process of tanning in China is thus described: The skins are put into tubs containing water, saltpeter and salt. After 30 days they are taken out, the hair is shaved off, and the skins well washed in spring water. Each hide is then cut into three pieces and well steamed, which is done by passing them several times backward and forward over a steaming oven. Further, each piece is stretched out separately over a flat board, and secured with nails, in order that it may dry gradually and thoroughly in the sun. The smoke of the oven makes the leather black, and if it is required to give it a yellow appearance it is rubbed over with water in which the fruit of the so-called wongchee tree has been soaked. Of the offal, glue is made by heating it in pans for 12 hours over a slow fire. The glue so obtained is poured into rough earthen vessels, where it remains three days in order to coagulate. The solid mass is cut into pieces with sharp knives, and carefully laid upon grating-like trays to dry, which are placed in open spaces, resembling the Dutch threshing floors. The time taken in drying varies according to the season of the year; with a northwest wind it will be about five days only, but with a southwest wind as many as 30 or 40 days will be required. The dregs from the offal left in the pans, as well as the hair from the skins, are sold to the farmers for manure. At Oak-sha, a village near Canton, there is an extensive establishment for the manufacture of leather, which is well worth a visit. The Mongols in wild parts of the country make clothes from goatskins, which are excellent and durable protection against cold and wet. When the hair is taken from the skins, carpets and mats are made from the latter.

## GOOD HEALTH.

## Eating When Exhausted.

When the strength of nerve power is already worn out or used up, the digestion of food only makes a fresh demand upon it, and if it is unable to meet the demand the food is only a burden upon it, producing mischief. Our bodies have been compared to steam engines, the food being the fuel and the steam produced the nerve power. The analogy holds good to a certain extent. If, when the steam is low, because the fire is low, you pile in too fast a quantity of coal, you put out your fire, and if you have depended upon steam power to run your fires, that is also extinguished.

Beyond this the comparison fails. You may clean out furnaces again, but in the body the consequences of this overloading are dangerous, and sometimes fatal. No case of cholera is more common than eating freely when exhausted.

The rule should be to rest for a time, and take some simple refreshment, a cup or part of a cup of tea, a little broth, or even a piece of bread, anything simple and in small amount, just to stimulate the stomach slightly, and begin to restore its power. After rest, a moderate quantity will be refreshing.

Never eat a full meal when you are exhausted. Take first a small quantity of anything simple, which may be handy, and rest. Then after a time proper food will be a blessing, not a burden. The fires will burn, the steam will be up, and you can go on safely.

It is not amiss in this connection to say that children would avoid many a feverish night, and many an attack of distress, if mothers would follow this rule.—*Exchange.*

EFFECTS OF BREATHING OXYGEN.—A young Frenchman, M. Aune, has lately made experiments on himself relative to this question, which he has chosen as the subject of a medical thesis. The experiments lasted four weeks, during which time he submitted himself to a uniform regime as regards quantity and quality of food, muscular exercise and intellectual work. He took oxygen only during the second and the third week, inhaling between 40 and 80 liters of it daily, but during the whole time he made a careful record of temperature, pulse, respiration, etc. The conclusions arrived at are briefly as follows: Inhalation of oxygen made under physiological conditions does not cause any inconvenience. One may absorb 100 liters, and even more, daily. Oxygen increases the appetite, and develops the functions of assimilation; and on this account it tends to increase the weight of the body. It produces a slight intoxication, and tingling sensation in the extremities. It raises the temperature very slightly. Under its influence the respiratory movements and the pulsations become more numerous. Oxygen has an incontestable action on certain elements of the blood; it increases the number of red corpuscles and of hemoglobins, and the richness of the former in hemoglobin. It has no influence on the white corpuscles. M. Aune did not experience that sensation of heat in the chest of which some authors have spoken in connection with this subject. Commenting on M. Aune's experiments, M. Hoyer remarks that the effects are only temporary, and that while inhalation of oxygen may be of service through favoring assimilation, it could not be made a definite treatment, and it would be necessary always to administer iron in addition. The inhalation gives very good results in the case of dyspeptic phenomena and obstinate vomiting.

## The Spread of Diphtheria.

The unusually large number of cases of diphtheria, occurring both on this coast and at the East, calls for especial care and intelligence in preventing the generation and spreading of this terrible disease. The following statement of the symptoms of the disease, and the precautions to be taken where it prevails, is being distributed by the Health Department of New York. Everybody should read it and attend to its warnings.

Cleanliness in and around the dwelling, and pure air in living and sleeping rooms are of the utmost importance where any contagious disease is prevailing, as cleanliness tends both to prevent and mitigate it. Every kind and source of filth around and in the house should be thoroughly removed; cellars and foul areas should be cleaned and disinfected; drains should be put in perfect repair; dirty walls and ceilings should be lime-washed, and every occupied room should be thoroughly ventilated. Apartments which have been occupied by persons sick with diphtheria should be cleansed with disinfectants, ceilings lime-washed, and wood work painted; the carpets, bed clothing, upholstered furniture, etc., exposed many days to fresh air and the sunlight (all articles which may be holed or subjected to high degrees of heat should be thus disinfected); such rooms should be exposed to currents of fresh air for at least one week before reoccupation.

When diphtheria is prevailing, no child should be allowed to kiss strange children nor those suffering from sore throat (the disgusting custom of compelling children to kiss every visitor is a well-contrived method of propagating other grave diseases than diphtheria); nor should it sleep with or be confined to rooms occupied by or use articles, as toys, taken in the month, handkerchiefs, etc., belonging to children having sore throat, croup, or catarrh. If the weather is cold, the child should be warmly clad with flannels.

When diphtheria is in the house or in the family, the well children should be scrupulously kept apart from the sick in dry, well-aired rooms, and every possible source of infection through the air, by personal contact with the sick, and by articles used about them or in their rooms, should be rigidly guarded. Every attack of sore throat should be at once attended to; the feeble should have invigorating food and treatment.

The sick should be rigidly isolated in well-aired (the air being entirely changed at least hourly), sunlighted rooms, the outflow of air being, as far as possible, through the external windows by depressing the upper and elevating the lower sash, or a chimney heated by a fire in an open fireplace; all discharges from the mouth and nose should be received into vessels containing disinfectants, as solutions of carbolic acid or sulphate of zinc; or upon clothes, which are immediately burned, or if not burned, thoroughly boiled or placed under a disinfecting fluid.

## Hints for Bathers.

According to the *London Lancet*, it is important to recognize that the only virtues of water as used by the bather are two—namely, its value as a cleansing agent, and as a surface stimulant. In this last capacity it simply acts as a medium affecting the temperature of the part to which it is applied, or which is immersed in it. Right views of fact in reference to this matter are important because there can be no question that some persons overrate the uses of cold water, and run considerable risks in their pursuit of them. Every beneficial action that can be exerted by a bath is secured by simply dipping in the sea, or a very moderate affusion of cold water! Except in cases of high fever, when it is desired to reduce the heat of the body by prolonged contact with cold, a bath of any considerable duration is likely to be injurious.

Then, again, it is necessary to recognize the risk of suddenly driving the blood from the surface in upon the organs. The "plunge," or "dip," or "shower," or "douches," is intended to produce a momentary depression of the temperature of the surface in the hope of occasioning a reaction which shall bring the blood back to the surface with increased vigor, and almost instantly. If this return does not take place; if, in a word, redness of the skin is not a very rapid consequence of the immersion, it is impossible that the bath can have been useful, and in nine cases out of ten when the surface is left white or cold, it does harm. The measure of value is the redness which ensues promptly after the bath, and this reaction should be produced without the need of much friction, or the bath is not worth taking. The rubbing employed to recover the circulation lost by the bath would probably have done more good without it!

Another effect of the bath when it acts properly is to stimulate the nervous system, through the vast series of its terminal fibers which are distributed in the skin. In this way, also, the action must be very rapid, or it is not efficacious. Unless the vigor of energy is quickly called out the agent is useless; and if it produces either drowsiness or depression it acts mischievously and lowers the power it is intended to stimulate and augment.

## SAN FRANCISCO:

Saturday Morning, Jan. 29, 1881

## TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Viaduct of Garabit, France; Legislative, 65. The Week, 72. Mines and Mining in 1880, 72-83 and 76-7.  
ILLUSTRATIONS.—Eiffel's Plan for a Bridge at Garabit, France, 65. The Steamship "State of California," 70.

CORRESPONDENCE.—Biabe, Arizona; Physical Studies of Lake Tahoe—No. 5, 66.  
MECHANICAL PROGRESS.—Improvements in Metal Working; To Polish Aluminium; Lathe Saws; The Locomotive a Precedent for Higher Piston Speed; An Electrical Blow-pipe; New Steel, 67.

SCIENTIFIC PROGRESS.—Ignored Facts in Electricity; Glacial Periods; Defections in Thermometers and Hydrometers; The Water Supply of the Earth Diminishing; Influences of Electricity on Vegetables, 67.

MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Notices of Assessments, Meetings and Dividends, 68.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 68-9.

USEFUL INFORMATION.—Dyeing; A New Implement; To Dry Straw Black; Light and Respiration of Seeds; New Welding Process; Cementing Labels to Metal; Expansion and Contraction; Tanning in China, 71.

GOOD HEALTH.—Eating When Exhausted; Effects of Breathing Oxygen; The Spread of Diphtheria; Hints for Bathers, 71.

MISCELLANEOUS.—Our Coast Steamship Trade; Underground Survey; Licenses, Collections and Mining Stock Certificate Tax; Stockton Mines, Utah; Sulphur in Sulphides and in Coal and Coke, 70. The State Line Mine, 71. Tombstone District; Mining in Maine, 74. NEWS IN BRIEF, on page 77 and other pages.

## The Week.

The Legislature is still in session at Sacramento, but so far has not accomplished very much in passing bills, although many have been brought before it.

We give this week our usual annual mining review, which occupies the principal portion of the space on our editorial pages. This review will be found to contain statistics valuable for reference, and a great deal of information worthy of perusal. It is impossible to make it otherwise than general in its nature, since the mining field has become so very much extended during the last two or three years. We have given from time to time all the detailed current news from the various mines, and this article only summarizes the results of the year.

It seems proper in this place to call the special attention of our readers to the merits of the PRESS. We aim continually to progress in our work, and spare no pains in getting all the latest information to our subscribers. We have recently made arrangements by which we will be able to present more engraving than formerly, and shall make a feature of illustrating all the new mechanical devices connected with mining and metallurgy.

A MEMORIAL to Congress by citizens of Los Angeles, relative to the harbor at Wilmington, sets forth that when the work was commenced there was but 18 inches of water over the bar at low tide. Now there is ten ft. In 1855 the business of the port was but 6,000 tons. Last year it was 110,000. The memorial asks for \$200,000, which according to the report of the Government Engineer, will be sufficient to deepen the channel over the bar to 17 ft. A resolution was passed, asking the Legislature to adopt a concurrent resolution endorsing the memorial.

The Assessor of Washoe county, Nevada, reports 14 irrigating ditches, aggregating 124 miles in length, and irrigating 13,800 acres. There are two railroads—77.15 miles—assessed at \$694,550; five wood flumes, 44 miles. Of the land in the county, 23,400 acres are agricultural, 206,400 grazing, 41,201 timber, and 92,160 mineral.

## Mines and Mining in 1880.

In accordance with our custom, in this month of the year, we present a cursory review of the progress of the mining industry for the previous year. Formerly, it was possible for us to enter into great detail concerning not only counties and districts, but prominent mines. California and Nevada so far overshadowed Montana, Idaho, Colorado and Utah, that the principal mining interest centered in the first mentioned States. Now all of them are large bullion producers, and to them are added Arizona and New Mexico. Moreover, Nevada has fallen from its place at the head of the list as a bullion producer to the third, California still keeping the second place. Colorado has jumped to the first place this year, its Leadville output having been very large. If the production of that camp can be kept up, Colorado will remain for a few years in the lead, unless the old Comstock should again vouchsafe to us another bonanza, when, no doubt, Nevada would take its old place again.

Speaking generally, the result of the year's work in 1880 was very encouraging, but it was not up to what was expected. Some of the new camps in Arizona and Colorado, about which we heard so much, did not give the dollars and cents to prove their great superiority. In truth, they were "hoomed" too soon. No mining camp is made in a day. Nor is the fact that several dozen companies are organized with big capitals, on paper, any guarantee of the existence of good mines.

Californians have always been reproved for their tendency to form joint stock companies, and until the past two years San Francisco was the center of mining stock transactions of this coast. The center of such transactions has been transferred to New York, and now all the Eastern people view such things in a different light. One of the great evils of the past year has been the miscellaneous stocking of all sorts of mines and the indiscriminate sale of stock. In fact, in many instances, it looked as if the only reason for forming the companies was to sell stock. Hundreds and hundreds of companies have been organized all over the coast during the past year, but most of them were organized in Colorado and Arizona, and the stock taken to New York.

Now a misapprehension exists as to the California stock companies. The lists called each day at the Stock Exchange in this city, until within the past year or two, did not include half a dozen California mines. When Bodie district came to the front, a lot of the mines of that district were listed; but before that, most of the mines were those of Nevada, with a few of Utah, Idaho, and half a dozen California. The mines of this State are worked more on legitimate enterprise than stock jobbing operations. So, although San Francisco people deal in mining stocks, they do not trade in their own mines on that account. We make these remarks to correct an impression we know to prevail in certain quarters, that California mining interests are languishing on account of the dullness of the mining share market.

## The Bullion Product.

It has been the custom to accept the figures of the bullion production for the year as indicating the progress of the mining industry. No better standard could probably be taken than this, as "coin talks," and we hear through the newspapers most exaggerated statements of mining camps and mines that in the end amount to comparatively nothing. If the figures, based on estimates of the various local journals, were added up, the aggregate bullion product would be apparently quadrupled to say the least.

Wells, Fargo & Co., who transport most of the bullion, report that the product of the precious metals in the States and Territories west of the Rocky mountains for 1880 is \$30,168,000, while last year it was but \$75,349,500. In 1880, the gold produced was \$33,522,200; the silver, \$40,005,400; the lead, \$5,742,400, and the copper, \$893,000. It will be noticed that silver forms within a fraction of 50% of the entire total, and gold is 41% of the total.

As we have said before, Colorado has stepped to the front as the principal bullion producer. She has had first rate opportunities, since capital has flowed into her borders for the past two years, while all other parts of the country have been comparatively neglected. The first place California used to hold, until placer mining began to give out, and the silver mines began to be developed, when Nevada took the lead and maintained it for several years. Colorado is now in the van, but it would be no great surprise if, in the near future, Utah, Arizona or Dakota did not become the leading bullion producing district of the country. These Territories have made rapid strides during the past two years, particularly the last named two. Four years ago Dakota was unknown as a bullion producer. It appears on the list for 1877 for the first time, when it is credited with \$1,500,000. Last year it produced over \$4,000,000, and has two or three fine dividend-paying properties. Four years ago Arizona was credited with a product of \$1,112,000, while last year the yield was nearly \$4,500,000. Utah has been a larger producer in the past five years than Arizona or Dakota. In 1876, Utah was

credited with a product of \$5,207,500. In the following year, this product rose to \$8,113,800, but in 1879, it was less than \$5,500,000, while last year it rose to \$6,451,000.

We have published Wells, Fargo & Co.'s statement in full, and now repeat the tables which accompany it.

Statement of the Amount of Precious Metals Produced in the States and Territories West of the Missouri River, Including British Columbia, (and Receipts in San Francisco by Express from the West Coast of Mexico,) During the Year 1880.	
States and Territories.	Gold Dust and Bullion by Express.
California.....	\$16,937,745
Nevada.....	2,268,733
Idaho.....	62,911
Washington.....	1,775,115
Montana.....	1,115,767
Utah.....	2,275,553
Arizona.....	27,300
New Mexico.....	3,149,081
Dakota.....	159,970
British Columbia.....	676,946
Total.....	\$27,924,866
Gold Dust and Bullion by other conveyances.	
California.....	\$345,000

Arizona.....	1,036,611
New Mexico.....	1,036,611
Dakota.....	1,036,611
British Columbia.....	1,036,611
Total.....	\$8,113,800
Total.	
Gold.....	\$38,278,166
Silver.....	15,031,611
Lead.....	1,036,611
Copper.....	893,000
Total.....	\$55,207,500

In addition to the above table, Mr. Valentine, general superintendent of the Express Co., gives the following table, showing the annual product for the past 10 years.

Annual Products of Lead, Silver and Gold in the States and Territories West of the Missouri River, 1870-1880.	
Year.	Product as per W. F. & Co.'s Statements, from British Columbia and West Coast of Mexico.
1870.....	\$94,000,000
1871.....	68,834,000
1872.....	55,784,000
1873.....	72,438,000
1874.....	74,019,000
1875.....	80,999,000
1876.....	90,076,000
1877.....	87,219,500
1878.....	87,219,500
1879.....	87,219,500
1880.....	87,219,500
Total.....	\$742,312
Product after deducting Amounts from British Columbia and West Coast of Mexico.	
1870.....	\$52,150,000
1871.....	40,351,824
1872.....	33,784,000
1873.....	47,684,302
1874.....	51,656,610
1875.....	57,703,433
1876.....	57,703,433
1877.....	57,703,433
1878.....	57,703,433
1879.....	57,703,433
1880.....	57,703,433
Total.....	\$488,000
The Net Product of the States and Territories west of the Missouri River, exclusive of British Columbia and West Coast of Mexico, divided, is as follows:	
Lead.....	\$1,080,000
Silver.....	15,031,611
Copper.....	893,000
Gold.....	\$38,278,166
Total.....	\$55,207,500

Of the product of the last 11 years, as reported by Mr. Valentine, \$29,715,000 was from British Columbia and Mexico. The average yield, including this foreign bullion, has been \$75,276,000 per annum. The yield last year was nearly \$5,000,000 above this average. The domestic bullion product shows an average of \$72,575,000 per annum for the past 11 years. The gold product for 1879 was the smallest in 11 years. It was the largest in 1877, when the total was \$14,880,200. The silver product was increased from \$17,320,000 in 1870 to \$45,846,000 in 1877. The domestic product of the Ter-

ritory under consideration during the past 11 years shows the following description:

Gold.....	\$413,330,300
Silver.....	\$42,801,200
Lead.....	41,285,400
Copper.....	808,000

Total.....\$798,323,900

Of the \$756,140,200 in gold and silver produced by the domestic mines on the Pacific coast in the last 11 years, nearly 55% was in gold, and of course over 45% in silver. During the past year these relations have been reversed. Silver formed nearly 54% of the domestic product for 1880, while gold of course was only a fraction over 46%.

## Dividends.

Although the figures showing the product of the mines in the aggregate are taken as a basis for comparison of annual product, and as a measure of the standard of prosperity, the figures showing the dividends cannot be taken as a standard of the prosperity of the various mines. Some mines may be paying dividends and running out of ore; or paying dividends without any ore, as frequently happens. Others not paying dividends may be opening up ore reserves or procuring machinery or making an important shaft or doing one of a dozen things.

Still people always want to know how the dividends have been distributed, taking their totals as indicating a prosperous or disastrous year. The San Francisco Bulletin has given carefully compiled statistics, showing the dividends of 1880.

Twenty-seven mines, either organized under the laws of California or owned by California capitalists, paid dividends during the year. Some of these have paid only one dividend, and one paid sixteen. Twelve of the mines are in California, eight in Nevada, four in Dakota, two in Arizona and one in Utah. These are not the only mines that have paid dividends during the year in these States and Territories. Others have made their distributions principally, if not solely, at New York, Boston, Philadelphia and London. Some of those paying at San Francisco have also paid at New York and Boston. Following is a detail list of the dividends:

Mines and Localities.	No.	Amount.
Argenta, Elko Co., Nev.....	1	\$30,000
Black Bear, Siskiyou Co., Cal.....	5	45,000
Bodie Con., Mono Co., Cal.....	3	100,000
Con. Virginia, Storey Co., Nev.....	2	540,000
Deadwood, Lawrence Co., D. T.....	11	275,000
Deadwood-Terra, Lawrence Co., D. T.....	1	50,000
Eureka Con. Eureka Co., Nev.....	12	250,000
Excelsior W. & M., Yuba Co., Cal.....	9	275,000
Father de Smet, Lawrence Co., D. T.....	7	210,000
Fresno Enterprise, Fresno Co., Cal.....	3	75,000
Grand Prize, Elko Co., Nev.....	2	50,000
Great Western Quick, Lake Co., Cal.....	1	12,500
Golden Terra, Lawrence Co., D. T.....	3	75,000
Homestake, Lawrence Co., D. T.....	16	490,000
Indian Queen, Esmeralda Co., Nev.....	1	6,000
Idaho, Nevada Co., Cal.....	12	127,100
Napa Con. Quick, Napa Co., Cal.....	9	40,000
Natoma W. & M., Siskiyou Co., Cal.....	3	15,000
New York Hill, Nevada Co., Cal.....	7	67,000
Northern Belle, Esmeralda Co., Nev.....	8	200,000
North Belle Isle, Elko Co., Nev.....	1	15,000
North Bloomfield, Nevada Co., Cal.....	1	45,000
Ontario, U. T.....	12	600,000
Ophir, Storey Co., Nev.....	1	100,800
Silver King, Plinal Co., A. T.....	3	75,000
Standard Con., Mono Co., Cal.....	13	925,000
Watt Blue Oval, Nevada Co., Cal.....	1	7,000
Western, A. T.....	7	525,000
Totals.....	155	\$5,233,900

The locality of the mine distributing the above amount to stockholders during the past year is indicated in the following table:

Mines.	Dividends.
California.....	\$1,732,100
Nevada.....	1,211,800
Dakota.....	1,000,000
Arizona.....	600,000
Utah.....	600,000

Totals.....\$5,233,900

In 1870.....\$5,233,900  
In 1879.....6,675,000

During the year 1878 the mines distributed \$18,234,700, but \$13,500,000 of that amount came from the California and Con. Virginia mines. This year the California does not appear in the dividend list, and the Con. Virginia paid only \$540,000. In addition to the California dividends for the past year, mentioned above, it is known that two or three mines in Plumas county, organized under the laws of New York, have paid several dividends at New York; also two California gold mines, and one Nevada silver mine, operated with English capital, have paid dividends at London. The Star-Grove mine of Nevada, incorporated at New York, has paid two dividends of \$20,000 each at New York during the past two months. The Tomhetone mine in Arizona, near the Western, has paid nine dividends of \$50,000 each at Philadelphia this year. There have also been several Utah mines, besides Ontario, that have paid dividends at New York this year. The Barbee & Walker and Stormont mines at Silver Reef are paying dividends. The former is paying 26% per annum, and the latter 32%. The Christy mine, of Utah, owned in this city, and worked as a clove corporation, has been producing from \$25,000 to \$30,000 per month right through the year, and we presume it has quietly divided considerable money among its few owners. The Green Mountain, La Plata and Rising Sun are also mines paying dividends. We know of some private gold claims in California, owned in this city, that have done the same thing. There are dozens of drift and gravel mines in this State paying dividends every month which do not appear in these tables, as they are owned by private companies, and their assets are not made public.

## Assessments.

The assessments levied last year were not paid with a very gratifying promptness in the

case of those mines which were suspected of being more in the line of stock jobbing operations than legitimate enterprises. The journal from which we took the above, also publishes a list of the mining companies which levied assessments in 1880. The list is very long, and covers 249 claims in California, Nevada, Idaho, Utah, Arizona, Dakota, Lower California and Mexico. As it takes at least two months to go through all the legal forms of an assessment, it is impossible for any company to get in more than six during a single year. Only one company succeeded in doing this during the past year. Sierra Nevada leads in the aggregate amount, having called in \$1,000,000, the largest amount collected by any single mine in three years.

There were 470 assessments, aggregating \$13,142,000. The list embraces 112 California mines located in 21 of the 52 counties of the State. Mono county gets \$1,918,900, and other counties nearly \$1,000,000, as follows:

CALIFORNIA.		
Counties.	No.	Amount.
Mono.	40	\$7,918,900
Placer.	10	206,200
Nevada.	11	174,500
Inyo.	2	155,000
Anaconda.	3	83,000
Sierra.	3	75,000
Butte.	6	67,000
Mariposa.	1	45,000
Calaveras.	6	31,000
Yuba.	2	23,000
San Bernardino.	1	27,500
El Dorado.	5	25,000
Tuolumne.	3	23,000
Plumas.	1	13,500
Del Norte.	3	10,000
Shasta.	2	9,000
Trinity.	2	5,000
Tulare.	1	5,000
Fresno.	1	3,000
Tehama.	1	3,000
Alpine.	1	2,000
Totals.	112	\$2,900,000

Nevada is the great absorbent of assessment money, the Comstock lode, which runs through Storey county, taking the lion's share. That State has made the poorest returns this year for the amount of money expended of any of the mining fields under consideration. Following is the apportionment:

NEVADA.		
Counties.	No.	Amount.
Storey.	61	\$7,789,900
Esmeralda.	13	552,500
Eureka.	6	237,500
Kiko.	9	235,000
Lincoln.	3	190,000
White Pine.	4	160,500
Nye.	4	132,500
Ormsby.	1	25,000
Humboldt.	1	10,000
Lander.	1	9,000
Lynn.	2	87,000
Total.	105	\$9,381,900

Arizona has developed one dividend mine this year that has given back more than the 18 mines in the annexed list have collected:

ARIZONA.		
Counties.	No.	Amount.
Yavapai.	4	\$100,000
Pinal.	3	99,000
Mohave.	2	65,000
Yuma.	2	13,000
Maricopa.	2	11,000
Total.	18	\$378,000

Utah has been very moderate in its demands. Its importance as a mining field was never so well understood as it has been during the past year. Here is the list of assessments:

UTAH.		
Counties.	No.	Amount.
Washington.	1	\$21,000
Juan.	2	15,000
Little Cottonwood.	1	8,000
Total.	4	\$44,000

Most of the money for Dakota was collected by the Caledonia Mining Co. The mine is said to show good prospects of returning the outlay. There are three dividend-paying mines in Dakota. Idaho has made only one call for aid this year through the Florida Co. There are two mines in Lower California and two in Mexico that have levied assessments in this city during the year. The apportionment of assessment money for these miscellaneous sources for the past year has been as follows:

MISCELLANEOUS.		
Orgs.	No.	Amount.
Dakota, Lawrence Co.	5	\$345,000
Idaho, Owyhee Co.	1	10,000
Lower California.	2	17,500
Mexico.	2	65,000
Totals.	10	\$437,500

The grand total of mines assessed and money collected compares as follows:

	No.	Amount.
1880.	470	\$13,142,000
1879.	514	14,827,700
1878.	422	13,951,500

Of the assessments levied this year, not over 50% was paid in. In many cases the collections were not sufficient to pay the cost of advertising the assessment and delinquent notices.

#### California.

We have, each week, during the past year, given such close and detailed accounts of the various localities and mines in this State, that it is scarcely necessary in this review to make other than general statements. We have kept close track of the progress and development of the California mines, and those of our readers interested in any particular one, cannot fail to have noticed that we have as often as occasion offered, given the current news concerning it. We have, moreover, from time to time given such general views of the general progress of our most important industries as seemed to reflect the facts connected with it.

California has shown this year an increase of bullion production. This fact has surprised

some few persons, who saw no reason for her to do so. The truth is, too many persons have their opinions on mining matters from the state of the mining stock market in San Francisco. They thought that because mining stocks were not "booming" there was, therefore, a corresponding depression in the mining interests of California. There could be no greater mistake. California mines are not called in the stock boards, if we except those of Bodie. The gravel and drift mines of this State produce from \$14,000,000 to \$15,000,000 per year, yet there is not a single one quoted on our stock markets.

The reasons for an advance in the bullion product are plain. Men are pitching into work more cheerfully. All over the State we hear of two, four, six or eight men at work on claims of their own. Many old abandoned claims which would not pay to work under the old system of high wages and extravagant expenditure of all kinds, have been relocated by industrious men and properly developed. In most of the counties of the State one may now see arastras at work here and there. The poor man's mill is the best possible thing for a gold country. It is cheaply built, cheaply run, easily managed, and does its work well. It will build up a country better than 10-stamp mills, because with its small properties can be developed by few men. The mill requires a big mine, big company and increased expenses. Where, however, the arastra is seen at work, there we know the mine belongs to a few men who are working it in their own interests, and not for wages.

Although large companies with extensive works, employing a hundred or more hands, advertise a camp more than anything else, a few dozen small companies of industrious men will develop the country better. Working miners, laboring on their own mines form part of a permanent population; miners who work for wages become more or less nomadic in their habits, build no abodes for themselves and cannot be said to have that interest in the country that they would have as owners of claims.

The principal quartz mining centers in the State are at Grass Valley and Nevada City, Nevada county and Bodie, Mono county, and probably a few facts concerning each will illustrate the state of the industry.

#### Grass Valley and Nevada City

Are about four miles apart, each being in the center of a district bearing the respective names given. Grass Valley mining district is one of the richest gold producing regions in the world. The operations there are principally confined to quartz that being the point where quartz mining was first begun on the coast. It is in Grass Valley township that we find such mines as the New York Hill, Idaho, Rocky Bar and a host of others large and small.

Some facts concerning the Nevada City district, which we take from the *Transcript*, will be of interest. This district is about four miles long and three wide, Nevada City being near the center. The mines are situated in granite and slate formations, as well as on the contact between them. The granite extends from a mile west of Nevada City to three miles east, the slate being to the east and west of these points. Many of the chutes are found to be rich at the surface, but are usually the best and strongest in the lower workings of most of the mines. The lodes average from two to four ft. in thickness. The ore is composed of quartz and sulphurets. The yield in free gold is from \$12 to \$60 a ton, although much "specimen rock" is found that will pay as high as \$20,000 a ton. The ores pay from one to four per cent. of their gold value in silver. The gold is worth, as it comes from the mills, from \$16 to \$18 an ounce. Sulphurets pay from \$100 to \$1,000 a ton, averaging from \$150 to \$250. The best mines in the district are from 300 to 1,000 ft. deep, and all of them are holding their own, while some are improving, as sinking progresses. After a mine is properly opened ore can be extracted for from \$2 to \$5 a ton. An ordinary mill-stamp will crush from 1½ to 2½ tons of ore per 24 hours, at a cost varying from \$1 to \$2 a ton. Mining and milling should ordinarily be done for from \$5 to \$7 per ton. Sulphurets can be reduced by the chlorination process at from \$16 to \$20 a ton. The Providence and Merrifield mines have extensive chlorination works of their own, and there are two custom works—Maltman's and the Pioneer.

The cost of labor at Nevada City, in working the mines, is as follows: Unskilled workers receive from \$2 to \$2.50 per day of 10 hours; miners, in most claims, \$3; millmen and engineers, \$3 to \$4; mechanics, \$3.50 to \$4. Millmen and engineers sometimes work 12-hour shifts. A large portion of the mines work three eight-hour shifts.

In 1878 the bullion shipments from Nevada City by Wells, Fargo & Co., amounted to \$1,207,000; in 1879, to \$1,292,762; in 1880, \$1,267,252. It is estimated that of the above total about one-third was from quartz and the remainder from gravel claims. It does not represent the entire amount of bullion shipped to Nevada City, as a number of prominent mine owners send their product away through other mediums of transportation.

In Grass Valley district, is situated the well known Idaho mine, which may be considered as one of the representative gold mines in this State. We give some figures concerning this mine from the last annual report, as it will give readers a broad idea of the expense of running such a mine.

After an expenditure of about \$90,000 on the property the Idaho mine commenced paying

dividends in 1869, and with but few intermissions has paid regular monthly dividends ever since, the total number of such being 136, amounting to \$2,830,300, out of a total yield in the twelve years of \$6,140,183 02. The yield of the past year has been \$440,445 59, out of which dividends to the amount of \$127,100 have been paid.

There has been paid out in dividends to the stockholders as follows:

	Div.	Per cent.	Am't.
1869	11	55	\$170,500
1870	7	12	31,200
1871	11	15	232,500
1872	11	12	162,750
1873	12	22	683,000
1874	11	10	137,750
1875	11	55	172,050
1876	12	82	235,750
1877	12	77	240,250
1878	12	85	168,550
1879	12	51	127,100
1880	12	41	127,100

Being for 12 years 136 dividends, aggregating 913 per cent. on the capital stock, and amounting to \$2,830,300.

The ore worked during the year amounted to 28,072 tons. Of this amount 6,270½ came from the 800 level; 134½ from the 900 level; 6,051½ from the 1,000 level; 14,776½ from the 1,100 level; and 739 from the 1,200 level. This gave a yield of—

24,457 ounces of bullion.	\$426,939 46
68 tons of slime sold.	1,252 00
Est. cost working same.	1,005 00
Tailings worked on shares.	5,508 12
321 tons tailings sulphurets.	4,589 72
50 tons of bulidie sulphurets.	4,317 36
Sold 10½ tons sulphurets.	689 85
Est. cost of working same.	202 50
Specimens sold.	65 00

Total. \$444,118 69

Yielding an average of \$15.82 per ton; average cost of milling per ton, \$9.29½.

Following is a table of expenses for the year:

Milling, mining, repairing.	\$280,611 43
Grinding tailing out per ct.	1,233 17
Exhaust fan for air shaft.	425 00
Iron hobs for underground.	719 00
Three plank poles and castings.	1,225 00
Steam capstan.	1,646 54
Sinking incline.	4,496 00
Prospecting on 1000 level and crosscut.	1,578 25
General account.	12,821 62
Saving sulphurets.	2,542 50

Total expenses. \$290,795 61

This statement is only given to illustrate the operations of a representative California gold mine.

#### Bodie.

In Bodie district, which last year was "booming," times have been dull this year. A great many mines shut down, and many miners left. And this notwithstanding, the district produced \$3,636,699 13 in 1880, an excess of over half a million over the figures of 1879, and of nearly three millions over those of 1878, when the Bodie "boom" was at its height.

The agent of Wells, Fargo & Co., at Bodie, furnished the following figures of the production of that camp for the periods stated:

SHIPMENTS IN 1877.	
Standard.	\$794,322 60
Mexican, Red Cloud and Kate Rogers.	12,000 00
Total.	\$797,022 60
SHIPMENTS IN 1878.

#### SUMMARY OF SHIPMENTS.

1877.	\$797,022 60
1878.	2,129,732 58
1879.	2,556,847 58
1880.	3,063,699 13

Total production to December 31, 1880. \$3,547,301 09

The above production was from the several mines, in the following proportion:

Standard.	\$5,117,516 08
Noonday.	2,236,121 72
Bodie.	2,436,259 60
Bulwer.	338,827 71
Bechtel.	71,690 58
Syndicate.	37,085 33
Belvidere.	25,901 25
Red Cloud.	10,927 50
Sitting Bull.	3,485 09
Mexican.	2,000 00
Dudley.	1,745 06
Kate Rogers (Summit).	338,827 71
Scattering.	132,445 26
Total.	\$3,547,301 09

Some of the large mines at Bodie will have to prove the existence of ore bodies at great depth before confidence will be fully restored, though mines are better at Bodie now than they were a short time since. One of the local papers, a short time since, had the following suggestions to make concerning a necessity of the camp: "To develop mining property requires capital. Having but a limited amount to invest in this class of securities, it is not the part of wisdom to consolidate that little, instead of each company struggling against hope and spending the little they have without being able to open up and develop their property. It is immaterial how favorable the prospects of our mines may be, we are now down to a point—the water level—requiring large expenditures to properly develop their hidden wealth. The financial condition of a single company will not permit of this expenditure, in view of which fact it appears to us that the proper and only remedy is a consolidation of adjoining properties. This will bridge the chasm and allow the work of development to proceed. Pool interests, joint forces, and a power is created that leads to immediate and successful results. Not consolidating the mines; sink combustion shafts at proper points along the line of the lead, each furnished with heavy pumping and hoisting machinery, and the companies interested in the combination each working their mine through the shaft. One of these two propositions must be adopted for the successful operation of a large number of mines in this district, and none will question it, in the interest of every stockholder that combination or consolidation should be general on the whole line of the lead."

The milling capacity of the district is 134 stamps. It is believed that this capacity will be doubled during the present year, and the bullion output largely increased. The business of the town of Bodie, which, during and subsequent to the excitement of a few years ago, was greatly overdone, is now assuming a more healthy tone, and those business houses which have survived the depression of the past year anticipate a prosperous season. The adjoining mining camp of Lundy or Mill Creek, situated 24 miles west, is attracting great attention, owing to the satisfactory results attained by the May Lundy mine in its milling operations. Aurora, 12 miles east, in Nevada, is also likely to enlist great interest during the year, as the Cook brothers are developing a rich mine in the properties recently purchased by them of ex-Governor Bladell. Tioga district, Mono county, is also regarded with much favor by mining men.

#### Hydraulic and Drift Mining.

The hydraulic and drift mines of California, which produce at least two-thirds of the bullion of the State, had a fairly prosperous year in 1880. Though late in getting to work, on account of the severity of the preceding winter, whereby the water was frozen up and the ditches filled with snow and ice, still the season proved, on the whole, an extremely favorable one, water being abundant and holding out until an unusually late period in the summer. Several of the larger companies might be said to have had water throughout the whole year, not having discontinued gravel washing entirely until the month of November. This only left them time enough to clean out their ditches and put their claims in good working shape before the advent of the recent winter rains, so short an interregnum of active operations having perhaps never occurred before in the history of hydraulic mining.

This branch of mining has, in fact, been improving somewhat for a number of years past, a result due to a variety of causes, such as greater experience gained by those engaged in it, to the employment of improved apparatus, increased water supply, better facilities for disposing of the tailings, etc.; no year having passed without bringing with it material gains in each of these respects. In nothing has this pursuit been so much advanced as through the constant enlarging of old and the building of new ditches, and the construction of reservoirs for storing and retaining for future use large quantities of water that before ran to waste. Through these additional aids the capabilities of this class of mines have, within the past few years, been increased fully 20%.

The principal localities where hydraulic mining is carried on is in Dutch Flat and Gold Run on the San Juan ridge, about Smartsville, at and near Cherokee, Butte county, and along in the districts adjacent to Slate creek. While the deposits on the Forest Hill divide, Placer county, are, in point of magnitude and richness, second to none elsewhere, the insufficient water supply restricts hydraulic mining in that locality to a comparatively narrow limit.

In Trinity, Siskiyou and Del Norte counties, occupying the northwesterly angle of the State, the business has been prosecuted over a large extent of territory and with a good measure of

(CONTINUED ON PAGE 76.)

## Tombstone District.

A correspondent of the *Citizen* writes as follows from Tombstone: The Mona mine, in the Turquoise camp, is showing up in excellent style. The new working double compartment shaft is now down 89 ft. and timbered from top to bottom in the best of style. They are down about the same distance on the discovery shaft, and when both shafts are down about 100 ft. they will run a drift to connect them. The ore is improving in richness, and the width of ledge is not known yet.

The Defense is not being worked at present, but a large force of men will commence work shortly.

The Contention (Turquoise camp) is down some 40 ft. and the bottom of the shaft is all in ore which will go well up into the hundreds. The Bradshaw is now down over 200 ft., and they are taking out \$1,000 rock.

The Tough Nut hoisting works are all completed with the exception of getting some of the machinery in place, which will be done in a day or two, when they will start up.

The Head Center and Tranquility Mining Co.'s are erecting hoisting works. The Head Center is now down about 420 ft.

It is the intention of the Contention and Grand Central Co.'s to run a railroad from Benson to Tombstone, if the Southern Pacific railroad does not commence shortly; so there is no doubt that we will have railroad connection soon.

The Vizina mine is shipping ore to the Boston mill daily, but the mill will not commence to run on the ore for some days yet.

Major Bayless has started work on the Anchor mine, and they are now down 25 ft., with a most satisfactory showing. It is his intention to open it up in earnest.

The mines along the Charleston road, in the southern part of the camp, are now attracting considerable notice.

The Oakland, owned by Messrs. Irwin and Poage, is down 25 ft., and showing up in excellent shape, and will continue to some depth further under the management of a San Francisco party, who is working it for an interest.

**MINING IN MAINE.**—Mining down in Maine is a funny business to lookers-on from the Pacific coast. The men running the mines appear to be old sailors and Nantucket whalers. They speak of the levels of a mine as "decks," and the force of men employed is the crew. The Superintendent is the skipper and the foremen are his mates. When the skipper passes through the main hatch and gets down to the bottom of a three-decker mine, he calls out along the main gangway toward where the "chase" (lode) was last seen, and asks his first mate: "How does she head?" "Sou-sou-west half west," says the mate. "Port your helm to the larboard and hold her a little more sou," says the skipper. "Aye, aye, sir," cries the skipper, "sou it is." Then, turning to his second mate, the skipper says: "Mr. Jones, are we making much water now?" "Just sounded the well, sir, and found out about four ft. I stopped the worst leak we had this morning at four bells." "Very well, sir; if she makes much water better man the pumps. Now, sir, if all is right below decks, suppose we go up to my cabin and splice the cable."—*Virginia Enterprise*.

ARIZONA expects to stand next to Colorado as a hullion-producing region this year.

## Business Directory.

We furnish Telephones for \$10 per set. Wire, 5 cents per rod; Insulators, 15 cents each for every 200 feet of line. Illustrated instructions for putting up.

**HOOVER TELEPHONE CO.,**  
328 Montgomery Street, S. F.

WM. BARTLING.

HENRY KIMBALL.

## BARTLING &amp; KIMBALL,

## BOOKBINDERS,

Paper Rulers & Blank Book Manufacturers  
505 Clay Street, (southwest corner Sansome),  
SAN FRANCISCO.

JOHN A. CHURCH, E. M. PH. D.  
MINING ENGINEER,

Room 75, 115 Broadway, New York.

Agent for PADDOCK'S Ore Dressing Machinery.  
Mining Machinery supplied.

## San Francisco Cordage Factory.

Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Ropes, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

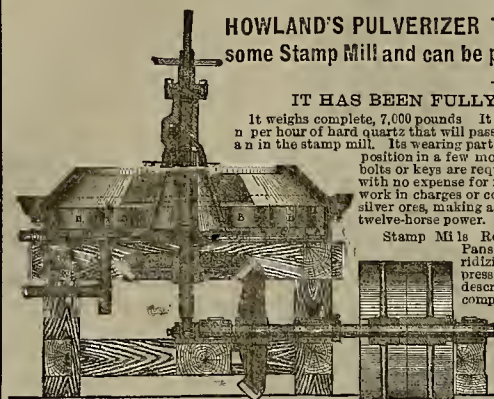

**TUBBS & CO.,**

611 and 613 Front Street, San Francisco

## MOREY &amp; SPERRY,

MANUFACTURERS OF

## Gold and Silver Grinding and Amalgamating Machinery

**HOWLAND'S PULVERIZER** Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supply Iron Work complete for Wood Frames, also

**SPERRY'S  
WROUGHT IRON FRAME  
FOR STAMP MILLS.**

It is a great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

**MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.**

## PACIFIC MACHINERY DEPOT.

## H. P. GREGORY &amp; CO.,

Nos. 2 and 4 California Street, San Francisco.

Importers and Dealers in every description of

## MACHINERY!

Sole Agents for the Pacific Coast for

**BUCKEYE  
Engine Company.**

J. A. Fay & Co.'s Wood-Working Machinery; Benoit & Sons' Machinists' Tools; Blake Steam Pumps; N. Y. Estling and Packing Co.'s Rubber Goods; Sturtevant Blowers and Exhaust Fan; Tanite Co.'s Emery Wheels and Machinery; Payne's Vertical Engines and Boilers; Perry's Centrifugal Pump; Judson's Standard Governors; Dreyfus Self-Oilers; Gould Mfg Co.'s Hand and Power Pumps; Eclipse Windmills; Disston & Sons Circular Saws; Otto Silent Gas Engine; Dies' Elevator Cages; Ballard's Oak Tanned Belting.

Also on hand and for sale A FULL LINE OF MILL AND MINING SUPPLIES.

## NOTICE!

## ENGINEERS, DEALERS AND USERS OF STEAM PUMPS

Will please take notice that we have taken the sole agency for the **KNOWLES' STEAM PUMP**, for the Pacific Coast States and Territories, and keep a full stock of Pumps and Duplicate Parts on hand at all times.

## PARKE &amp; LACY,

Nos. 21 and 23 FREMONT STREET.

San Francisco, Cal., September 23, 1880.

## LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!

PATENTS REISSUED 1868.

The "OLD RELIABLE" with improvements, making it

THE MOST PERFECT TURBINE NOW IN USE.

Comprising the Largest and the Smallest Wheels, under both the Highest and Lowest head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for New Prices, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

**JAMES LEFFEL & CO., Springfield, Ohio,**  
and 110 Liberty St., N. Y. City.

SAVE YOUR  
GOLD AND SILVER.

I am prepared to demonstrate, if miners will bring me from 500 pounds to a ton of their ores, that I can save from 25 to 100 per cent. more than any other machinery now in use. I will make no charge.

Machinery can be seen in operation every day at No. 143 Fremont Street.

M. B. DODGE.

## BOILER COVERINGS.

Plastic Cement and Hair Felt, with or without the Patent "AIR SPACE" Method. Cement ready for use by the barrel.

G. C. FOWLER, No. 413 Pacific St., S. F.

Residence: 965 West Street, Oakland. Office: 759 Market St., San Francisco.  
Before 10 A. M., after 5 P. M. From 11 A. M. to 3 P. M.

## A Card from Architects.

## The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:

Believing that a journal of this kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review" we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huern, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Hennickson

AMERICAN  
MACHINE AND MODEL WORKS.

Experimental and Fine Special Machinery, Planing, Gear Cutting, Patterns, Models for Inventors, etc. Printing Press and General Machine Repairing. Punches, Dies, Taps, Reamers, etc., made and repaired

I. A. HEALD, Proprietor.

514 Commercial Street, above Sansons, San Francisco.

## THE IMPROVED INGERSOLL

## Rock Drill and Air Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Coast.

**GEO. R. FOARD, GEN'L AGENT,**  
No. 13, First St., S. F.

## CAUTION.

To the Public Generally. Notice is hereby given that George R. Foard, of No. 13 First Street, San Francisco, is the sole authorized agent for the sale of our manufactures, consisting of Rock Drills, Air Compressors, and duplicate parts of either in the territory known as the Pacific Slope, and that no other person or persons have any right or authority to represent them as the agents of this Company within the above mentioned territory.

Also, take notice, that all persons manufacturing, or using any Rock Drills, Air Compressors, or duplicate parts of either, manufactured by others, embracing in their construction the mechanical inventions and appliances covered by the Patents owned by this Company, will be prosecuted for such infringement.

INGERSOLL ROCK DRILL CO.

New York, November 30, 1880.

Scientific and Practical Books  
on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare hook on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 150 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3.00 coin, postage free.

## FOR SALE

By Private Treaty as a Going Concern.

THE NEW BATTLE MOUNTAIN COPPER MINES, with Steam Engine and Boiler, Pumping and Hoisting Machinery, with Boarding House, Office and Dwelling Houses, and a large Concentrating Mill and Ranges at Willow Creek, two miles from the mine, where there is a full supply of water for milling purposes. These mines have been in active operation for the past 12 years and have yielded large quantities of high percentage Copper ore. The mines at present are in regular course of working, and monthly shipments of high percentage ore are being made. The average assay of the ore for the past 18 months, has been 42% of Metallic Copper.

The Virgin Mine is sunk to the 600-ft. Level and is supplied with ample Pumping and Hoisting Machinery.

The Lake Superior Mine is sunk to the 135-ft. Level.

There is a large quantity of ore in the dumps at surface that can be profitably treated by Milling and Concentrating. The above mines are situated at Copper Canyon, 15 miles from Battle Mountain station, on the C. P. R. R., and 9 miles from the Nevada Central R. R., and are approached by excellent roads.

Further information respecting the property may be obtained of Messrs. HELLMANN BROS. & CO., Front St., San Francisco.

To inspect the property, and for full information thereon, application must be made to SAM'L G. TRURAN, the Superintendent at the mines, who will be open to receive offers for the same, until Monday, the 14th day of February, 1881. The above property offers a rare opportunity for parties desirous of investing in copper mines.

The Directors do not bind themselves to accept the highest or any offer.

## NEW BATTLE MOUNTAIN MINES,

Oakland, P. O., Battle Mountain, Lander County, Nevada.

SAM'L G. TRURAN, Superintendent.

January 11th, 1881.

**Metallurgy and Ores.****Nevada Metallurgical Works,**

Office, No. 320 Sansome street, Room 10.

**New Book on the Comstock.**

The attention of MINING ENGINEERS and EXPERTS  
is called to the new work by JOHN A. CHURCH, E. M. Ph.  
D., on "The Comstock Lode, its Formation and History." This  
very exhaustive treatise on this famous lode is fully  
illustrated with diagrams and colored charts showing a  
tions, ore bodies, etc., and will be of great interest and im-  
portant value for reference. DEWEY & CO., Publishers of  
the MINING AND SCIENTIFIC PRESS, are sole agents for the  
sale of the work. Mr. E. M. SEATOR will act as their  
agent, and call on Mining Engineers and those interested in  
the great lode in this city with a copy of the book for their  
inspection.

## Mines and Mining in 1880.

(CONTINUED FROM PAGE 73.)

success, many of the conditions there being extremely favorable.

In our drift mines great progress is being made. In many localities Eastern capital has been invested in this class of mines, and large areas of new ground are now being opened which will not be productive for some time to come. We have in very recent numbers of the PRESS had so much to say in general and in detail about this class that it is scarcely necessary for us to repeat it in this issue.

## Nevada.

The State of Nevada, so long this leader in the list of bullion producers, has dropped back to No. 3. This is due to several causes, the main one being the failure to find any new bonanzas on the Comstock, and this increased cost of mining at great depths. The Comstock is by no means played out, however, and any day a bonanza may be struck.

To even enumerate the various districts of Nevada with their prospects, would be more than our space will permit.

Eureka district has made itself famous by the enormous output of the Eureka Con. and Richmond Con. mines. Its great drawback is the expensive treatment of ore. Moreover, the district needs capitalists to take hold of some of its prospects and develop them systematically.

The formations underlying the comparatively shallow workings of the present day will have to be examined. Yet Eureka has many good mines, and has produced more than any camp in Nevada, with the exception of the Comstock. The district shows no abatement in vigor, but holds its own remarkably well.

On the Comstock, as we have stated, it has not been a prosperous year. This stock market affects that section of country more than any other, as that section of country affects the stock market. No bonanzas having been developed, no stock market boom was raised. Work continues, however, in the lower levels of the big mines, and some magnificent pumping machinery has recently been put up.

The two principal mines on the Comstock, the California and Con. Virginia, made this year what would elsewhere be considered heavy productions. The California produced \$890,575, and the Con. Virginia, \$1,756,536, an aggregate of \$2,647,151.

As we have taken the figures of expenses and production of a representative California mine, we will here take the figures of 1880 of a representative Nevada mine—the Con. Virginia:

This representative and noted bullion-producing mine, which has yielded a total of \$64,970,777 since it was opened, produced this year \$1,045,413.92 in gold and \$711,122.57 in silver, an aggregate of \$1,756,536.49. Average ore value per ton, \$31.76. Ounces fine silver for 1880, 54,977,650; average value per ounce, \$2.86. Weight of bullion produced during the year, 21 tons and 102 lbs. Ounces fine silver produced to date, 2,763,356,030; total weight, 1,159 tons 732 lbs. Total number of bars, 17,860. Ore on hand December 31, 1879, 135 tons; ore extracted during 1880, 55,562; total, 55,697 tons; ore reduced, 55,315 tons and 400 lbs.; on hand January 1, 1881, 381 tons and 1,600 lbs.; total cost per ton for extraction and reduction, \$17.04. They have now on hand at the mills and in the ore-houses, 381 tons and 1,600 lbs., valued by assay at \$12,125.96. In addition to the ore extracted there have been raised from the mine during the past year 14,325 tons of waste rock.

To show the great cost of mining such an extensive mine, we append the financial statement which gives the items:

Silver.....	35,895,430 06
<b>Total.....</b>	<b>\$64,970,777 95</b>

In addition to the above, the matter of the C. & C. shaft is to be considered. They received from various sources toward work on the shaft \$442,359 33, and a like amount was expended. In these expenditures the following items are the heaviest: Wages, \$140,362; candles, \$140 93; powder, caps and fuse, \$19,970; timber, \$64,233; wood, \$108,615; ice, \$16,975; wire cables, \$3,412.

We can give briefly, also, the figures which show the year's work of the California mine: During the past year ending December 31, 1880, there were extracted from the mine 37,454 tons of ore. There were remaining in the ore-houses and at the mills at the end of the year 905½ tons of ore. There have been reduced 33,395 tons, yielding bullion to the value of \$890,515 33, or \$23 21 per ton; this yield being over 75% of the assay value of the ore, no allowance being made for moisture.

The value of the gold contained in the bullion was \$247,728 89, and of the silver \$342,786 44.

In addition to the ore extracted, there have been raised from the mine 10,363 tons of waste rock.

Space will not admit of the publication in full of the financial statements accompanying the report of this company. Expenditures amount to \$817,188 48, and following are some of the principal items: Salaries and wages, \$149,683 50; Ophir, etc., for labor, \$26,494 87; timber, wood, ice, etc., \$56,014 60; total taxes, \$12,879 70; reduction, \$345,238 20; half expenses C. & C. shaft, \$98,500; Sutro tunnel royalty, etc., \$63,932 30. The actual cost of the mine was \$675,144 29; cost per ton, \$17 60; average daily wages, \$4 03. Ounces of fine silver in the year's output, 26,475 790; value per oz., \$29 7½; weight of bullion, 10 tons, 479 lbs.; number of bars, 164. Total production to date:

Gold.....	\$23,810 331 93
Silver.....	33,432 490 12
<b>Total.....</b>	<b>\$46,742 781 17</b>
Ounces fine silver to date, 1,312,237,340; weight, 664 tons, 450 lbs.; number of bars, 11,020.	

These two great mines have produced together \$129,720,559 05, a sum of money difficult to imagine even, as coming out of a couple of holes in the ground. Some newer sections of country, about which a great deal of stir is being made, and which have produced a few millions, have made more fuss about them than has been made about the two mines mentioned. It must be remembered that two mines, only, produced this immense sum, and are still producing between them, two and a half millions of dollars a year.

## Arizona.

Arizona is just now attracting a great deal of attention, and numbers of miners are flocking in that direction. The completion of the Southern Pacific railroad through the Territory has opened up new avenues of trade, and inspired life and activity in all branches of business. It is now possible for mining men to open up and develop mining property which, hitherto, it has been almost impossible to undertake with any reasonable chances of success. New mining camps have been organized, and old ones have been developed; mills and smelters have been brought in for the reduction of ores; towns have sprung up along the line of the railroad, and the population of mining camps has in many instances more than doubled during the past year.

There are numbers of small veins containing high grade ore, which will support a large pop-

ulation. There have been a great number of new districts opened within this past two years, and many valuable mines have been found. The principal difficulty there now, is the great number of men who want to sell their claims, compared with the number who want to work them. This evil will remedy itself, however, since the miners must eventually go to work on their own claims, and prove them up.

We have during the past year given a great deal of space to an enumeration of the resources of Arizona, so it would be superfluous for us to go over the ground again. The number of districts and vast extent of mining territory precludes the possibility of any extended review. The Tucson *Star* on the 1st inst. published an exhibit of the growth of Pima county for the year, which may be taken as a gauge.

The population has more than doubled; freight receipts were five times greater than the previous year; 5,485 mining locations were recorded, and 1,606 sales of mining property effected. The city of Tucson has increased its population one-third. The amount of freight delivered in Tucson during 1879 was 12,000,000 lbs., and during 1880 over 70,000,000 lbs. Property has appreciated in value 60%; the amount expended in building and improvement was over \$400,000, of which \$50,000 was for railroad building. The Southern Pacific Railroad Co. has laid 325 miles of track since February 1st. The entire span of track across Arizona from Yuma to New Mexico is 339 miles. All kinds of business throughout the Territory has increased in an astonishing ratio during the year.

Tombstone is the big district of the Territory. The *Citizen* gives the bullion yield of the Tombstone mines for the year 1880 at \$3,012,223, as follows:

Tombstone Company's mills.....	\$ 913,443
Corbin mill.....	36,000
Contention mill (nine months).....	1,200,000
Harshaw mill (four months).....	35,655
Opper Queen (four months).....	300,000
Boston and Arizona Reduction works.....	36,625
Sunset mill (short run).....	22,500
Holland (trial run).....	20,000
Placer gold, Pinal county.....	18,000
Other mills and arrastras.....	100,000
<b>Total.....</b>	<b>\$3,012,223</b>

The actual yield of the Contention (now known as the Western) mine, as officially reported by the Secretary, D. C. Bates, is \$1,214,055, that being the face value of the bars as shipped. The proportions of gold and silver are as follows:

Gold.....	\$ 224,443
Silver.....	989,607
<b>Total.....</b>	<b>\$1,214,055</b>

It is expected that six other mines in Pima county will contribute to the bullion supply for the current year.

The *Citizen* says of the copper ore developments in Arizona that the coming year will witness a growth of copper production that will rival the famous Lake Superior region, while in the future, as new discoveries are made, and new companies commence work, the industry will form no inconsiderable portion of Arizona's greatness.

## Utah.

Utah is doing excellently well, and while there is not now so much excitement about her mines as there was a few years ago, a more healthy tone is manifest. Her principal city is now deriving great benefits from the mines, to the northward as well as her own mines. Those who desire to go deeply into the history and statistics of the different districts of Utah, had better get one of the immense twelve page numbers of the Salt Lake *Tribune*, issued on the 1st inst. This paper gave an excellent review of the year in Utah, and gave a complete record of each district.

A perusal of the review of each mining district will show to the reader two prominent facts. The first is that among mining countries Utah is entitled to first rank; and second, only preliminary work has been, as yet, performed. There is not as yet a real deep shaft in the Territory, there are but four or five which are entitled to be considered as anything but prospecting holes. The minerals range through every variety. There are silver, gold, lead and copper, with all the metals which in any country are found in conjunction with those metals, while the iron deposits of the State are measured by mountains and the coal measures by counties. Of the latter two the supplies are inexhaustible and embrace all varieties. Of the gold, silver, lead and copper producing districts, many are making revelations which must soon draw a boom. Without slighting the others, Parley's Park, Stockton, Bingham, Tintic, Marysvale and Frisco deserve particular mention, because in these districts the most vigorous work is being performed. Still, there are men who claim that Star district is yet to be the coming camp, and one mine—the Silver Belle—in American Fork, begins to threaten to be the highest little mine, and not very little either, in the world. The Ontario at Parley's Park, is one of the wonders of Utah. Some shrewd men purchased it years ago at a low figure. Since then it has dishured in dividends \$3,150,000, and now in its lowest workings it is richer than it has been anywhere higher up. General Conner commenced at Stockton upon a little fissure a couple of feet wide, now at a depth of 300 feet, he has twenty-four ft. of ore. The last year's work in two or three important mines in Bingham has uncovered ore at a depth which the timid ones were afraid to explore. Enough has been done to show that the annual shipment of bullion from Utah is to increase every year for a generation, if not for generations to come. This peculiar silver

sandstone district of Silver Reef, Utah, produces over \$1,100,000 in bullion in 1880.

## Colorado.

The State of Colorado takes the first place in the rank of bullion producers this year, as our tables of bullion production show. A large amount of capital from the East has been brought into Colorado within this past two or three years, and the miners have been thus assisted in developing their properties, so that rapid progress has been made. Although there are a large number of camps in the State, Leadville overreaches them all. The *Leadville Herald* gives the following figures for the production of the camp:

From January 1, 1879, to July 1, 1879.....	\$ 7,813,866
For the month of July.....	1,054,439
For the month of August.....	1,296,352
For the month of September.....	1,505,085
For the month of October.....	1,339,168
For the month of November.....	1,032,026
For the month of December.....	1,002,779

**Total.....\$15,040,715**

## PRODUCTION AT EACH SMELTER.

Proving the total from the several smelters, the result is as follows:

Grant Smelting Co.....	\$ 4,018,290
Eddy, James & Co.....	1,363,334
La Plata.....	2,316,310
Leadville.....	14,218
American.....	1,230,126
Billings & Eilers.....	700,701
California.....	702,826
Dickson & Co.....	63,061
Little Chief.....	109,072
Chloride, Barton Mill.....	150,200
Ohio & Missouri.....	822,656
Cummings & Finn.....	1,234,213
Gage, Hagaman & Co.....	213,697
Oro Stamp Mill.....	3,438
Orla Chief.....	18,400
Tahor Mill.....	11,250
Elgin.....	462,439
Harrison.....	917,304
Robert E. Lee Mine shipped.....	114,318
Colorado Prince Mill.....	22,000
Gulch Mines.....	70,000

**Total.....\$15,040,715**

In addition there are 23,250 tons of ore on hand at the smelters, which is an increase of 15,000 tons over the amount of last year. This will make an increase of about \$1,000,000, which brings the approximation of the entire production to \$16,000,000.

The product of 1879 was \$10,189,521, which, compared with that of 1880, shows an increase for this year past of over 50% in the export.

The *Leadville Democrat* gives a list of the Leadville mines, showing the capital, par value of shares, and dividends paid up to January, 1881. This list comprises 42 mines, of which 16 have paid dividends, as follows:

Amie.....	\$ 305,000
American Consolidated.....	90,000
Breece Iron.....	20,000
Chrysalide.....	1,100,000
Chloride.....	150,000
Catalpa.....	60,000
Dunkin.....	105,200
Hibernia.....	100,000
Evening Star.....	125,000
Little Chief.....	700,000
La Plata.....	250,000
Leadville.....	150,000
Little Pittsburg.....	1,350,000
Evening Star.....	240,000
Robinson Consolidated.....	250,000
Robert E. Lee.....	1,200,000

**Total.....\$6,225,200**

It is said that these and other Leadville mines had previously divided among their owners \$5,697,300 in profits. For the limited time this camp has been prominently before the public it has done remarkably well.

## New Mexico.

New Mexico is now sharing with Arizona an influx of population and a rapid increase in prosperity. The summer climate of the northern part of the Territory is delightful. At Santa Fe, which has an altitude of about 7,000 ft., the nights are always so cold that heavy blankets upon the beds are comfortable, and the heat at midday, although sometimes great, is never oppressive. The winters are mild and sunny, with comparatively little snow. The low altitudes in the central and southern portions of the Territory are very hot and dry, but on account of the absence of moisture in the atmosphere and the exceedingly rapid evaporation, the apparent intensity of the heat is much reduced. The temperature of the mountains is always and everywhere delightful. The country has not yet been prospected to any extent. It lacks facilities for reduction of ores and means of transportation. But all this will be remedied before long. The mining outlook in the Territory is at the present time very encouraging. In the northern counties new mills are being erected, and machinery put in with activity. In the middle counties smelters are being erected, new discoveries are being made and parties of men are fitting out at every station for a few weeks' trip into the mountains. Gold, silver, copper, carbonates of lead and galena are found at almost every turn. The Black Range, Mogollons and Magdalena are showing prospects that to say the least are encouraging considering the amount of development. The *Herald and Southwest* say that in the southern section new locations are reported every day, and assays made which warrant the expenditure of considerable money in going deeper and drifting.

The country is badly in need of capital to develop some of the mines already found, but this will come before long. The railroad will bring the capitalists and the capital.

## Idaho and Montana.

Both Idaho and Montana are coming forward in bullion production again, though both have been languishing somewhat. Now, however, the mining excitement has brought to them an increased population, and new camps have sprung up, new mines been opened, and an era of prosperity set in. In Idaho the Wood River, Saw-

tooth and Yankee Fork mines are doing very well indeed. Wood River ores are shipped to Salt Lake at an expense of about \$60 per ton. In fact, the principal mines are owned by Salt Lake capitalists. Nineteen different mines sent in lots which aggregated 358 tons and 1,291 lbs. for which the owners received \$59,879.41, which is equal to an average of over \$168 per ton. All these shipments came from mines which were unknown eight months ago. By next spring, there will be a rush to the Wood River country. Montana is entering upon an era of renewed prosperity. The mines about Butte and Helena are the more prominent. Within a radius of 25 miles of Helena there are 133 stamps in operation, and 205 more will be added by spring. At Butte reduction works have been added of late, until now its camp is one of great importance. Montana was formerly a very large bullion producer, when her gold placers were in their prime, but now her quartz mines will do much to build up for her a permanent population. The Butte *Miner* gives the bullion shipments from Butte, Montana, for the year 1880 at \$1,428,088.

Oregon, Washington and Dakota. Oregon mining interests, when compared with those of the other States and Territories of the Pacific coast, are comparatively small. She has a number of good mines, however, and during the year a number of new ones were opened. The *Oregonian* claims that it is now known beyond a peradventure that large bodies of silver-bearing ore exist in the vicinity of Granite and Olive creeks in the counties of Grant and Baker, Oregon, wholly dissimilar in character, but equally profitable to the State when practically worked.

Washington Territory can afford to be without any gold mines while she has so many coal mines within her borders. Her coal interests are very extensive, and are being now fully developed.

Dakota keeps its position as a bullion-producer. The Black Hills mines, which created so great an excitement a few years ago, are being worked profitably, and several of the more prominent ones are paying regular dividends.

This review has already exceeded the limits originally set for it and we are compelled to omit mention of many things we had intended to refer to.

**HAGGIN & TEVIS.**—The well-known business firm of Haggin & Tevis, which has for so long a period been allied with leading business enterprises of the coast, is to be dissolved. The members of this firm are owners and managers of a great deal of mining property on this coast, and have for a long time identified themselves with the mining interests. As to the cause of the dissolution of co-partnership, Mr. Haggin says that for years the business of the firm had been assuming gigantic proportions; so much so, that, in fact, it had of late been impossible for either Mr. Tevis or himself to act jointly upon any matter; but that each had been driven, under pressure of business, to devote himself exclusively to his particular branch of the firm's affairs. It had, therefore, been considered by the partners expedient to dissolve business relations and wind up their affairs. The change did not involve any material modification of their former business pursuits, each being prepared to prosecute those matters most congenial to his tastes. While it was a matter purely of a private nature, the public were welcome to know, should it be of any interest, that individually, the late partners had no differences, and yet sustained the most friendly relations the one toward the other.

#### News in Brief.

THE health of Virginia City is now excellent.

SEVENTY patents were issued to women in 1880.

DIPHTHERIA is causing many deaths in New Brunswick.

THE Chileans numbered 40,000 at the surrender of Lima.

SITTING BULL has again retreated across the Canadian line.

A MOVEMENT is organizing in England against coercion in Ireland.

THE widow of the late Gen. Sutter died at Lititz, Pa., recently.

IT is said that Southern Wyoming wants to be annexed to Colorado.

CALLAO, as well as Lima, has been surrendered by the Peruvians.

THREE earthquake shocks were felt in the city and Oakland on Monday night.

A SHOCK of earthquake was felt at Bath, Maine, on the night of the 20th.

THERE are three inches of snow in New Orleans—the heaviest fall since 1852.

PARADISE VALLEY, Nev., raises 15,000 acres of wheat yearly, and has no flour-mill.

TRACK-LAYING on the Carson and Colorado railroad is still making rapid progress.

FLOODS have recently caused considerable damage in upper Washington Territory.

A COMPANY of Ohio capitalists is about to organize to lease the Cincinnati Southern railroad.

AN oyster war is in progress on the Rappahannock between the Marylanders and the Virginians.

THE Baldwin Locomotive works are building 144 locomotives for the Denver & Rio Grande R. R. Co.

#### Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

HALL'S VEGETABLE SICILIAN HAIR RENEVER is a scientific combination of some of the most powerful restorative agents in the vegetable kingdom. It restores gray hair to its original color. It makes the scalp white and clean. It cures dandruff and humors, and falling out of the hair. It furnishes the nutritive principle by which the hair is nourished and supported. It makes the hair moist, soft and glossy, and is unsurpassed as a hair dressing. It is the most economical preparation ever offered to the public, as its effects remain a long time, making only an occasional application necessary. It is recommended and used by eminent medical men, and officially endorsed by the State Assayer of Massachusetts. The popularity of Hall's Hair Renever has increased with the test of many years, both in this country and in foreign lands, and it is now known and used in all the civilized countries of the world.

FOR SALE BY ALL DEALERS.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquariae is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

THE MINING AND SCIENTIFIC PRESS finished its 41st volume with its last publication. We do not know the circulation of the paper in this community, but we do know that every mechanic and miner ought to take it, for by so doing they would benefit themselves far more financially than they are aware of.—*Shasta Courier*.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

#### Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

#### DIVIDEND NOTICE.

OFFICE OF THE  
Eureka Consolidated Mining Company.

Nevada Block, Room 37, San Francisco, January 15, 1881. At a meeting of the Board of Directors of the above named Company, held this day, a Dividend (No. 63), of Fifty (50) Cents per share was declared, payable on Thursday, January 25, 1881. Transfer books closed until the Twenty-first (21) instant.

P. JACOBUS, Sec'y pro tem.

#### ANNUAL MEETING.

The Annual Meeting of the Stockholders of the REAL ESTATE AND BUILDING ASSOCIATES will be held at the office of the Company, No. 230 Montgomery Street, on Monday, the seventh (7) day of February, 1881, at twelve o'clock noon of said day.

LUIS F. EMILIO, Sec'y.

**Blue Bird Mill and Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Globe District, Pinal County, Arizona.

Notice is hereby given, that at a meeting of the Board of Directors, held on the Eighth (8) day of January, 1881, an assessment, No. one (1), of Five (5) Cents per share was levied upon the capital stock of the corporation, payable immediately, in U. S. gold coin, to the Secretary, at the office of the Company, No. 10 Market Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fourteenth (14) day of February, 1881, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the Fourteenth (14) day of March, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

W. H. KNIGHT, Sec'y.

Office No. 10 Market Street, San Francisco, Cal.

#### A NEW TREATMENT

For Consumption, Asthma, Bronchitis, Dyspepsia, Catarrh, Headache, Debility, Rheumatism, Neuralgia and all Chronic and Nervous Disorders. It is taken

#### BY INHALATION.

And acts directly upon the great nervous and organic centers, and cures by a natural process of revitalization.

#### SENT FREE:

A Treatise on Compound Oxygen, giving the history of this new discovery, and a large record of most remarkable cures. Write for it. Address the proprietors, DR. STAR-KEY & PALLEN, 1109 and 1111 Girard street, Philadelphia, Pa., or H. E. MATHEWS, 608 Montgomery street, San Francisco, Cal., from whom can be procured both information and supplies.

People May Hear With

**DEAF AUDIPHONES**  
OR WITH  
**EARPHONES.**

Trial before purchase. Don't waste your money otherwise. Send for free pamphlet. (Address H. E. Mathews, as above.)

#### ST. DAVID'S.

A FIRST-CLASS LODGING HOUSE  
CONTAINS 113 ROOMS.

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from \$2.50 upwards.

R. HUGHES, Proprietor.

At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

**WANTED.**—A SECOND HAND ENGINE, FROM 35 to 40 HORSE-POWER, and two boilers, in good order, to be delivered at Stockton for cash. Full description of Engines required in replies. Address LOCK BOX 1403 San Francisco, Cal.

#### INCERSOLL ECLIPSE ROCK DRILLS.

The Most Economical Air Compressors in the Market.

#### MINERS' HORSE-POWER.

One Horse can easily hold over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is hoisted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS & RIX,  
49 Fremont St., S. F.

To Foundrymen, Engine Builders, Mill Owners  
and Engineers.

If there is a Gardner Governor within 1,000 miles of San Francisco, which was bought the past year, and is not now giving perfect satisfaction, send it to us and we will fix it for nothing, and guarantee it for another year.

BERRY & PLACE MACHINERY CO.,

323 Market street, San Francisco.

#### Mining & Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

Repairing promptly attended to at the lowest possible terms.

### UNION IRON WORKS,

SACRAMENTO, CAL.

ROOT, NEILSON & CO.,

MANUFACTURERS OF

### STEAM ENGINES, BOILERS AND ALL

Kinds of Machinery for Mining Purposes.

Flouring Mills, Saw Mills and Quartz Mills Machinery constructed, fitted up and repaired.

Front Street, Between N and O Streets, SACRAMENTO, CAL.

### Golden State & Miners Iron Works,

Manufacture Iron Castings and Machinery of all Kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

### California Brass Foundry,

No. 125 First Street, Opposite Minna, SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Sells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. **PRICES MODERATE.** J. H. WEED. V. KINGWELL.

### California Machine Works,

WM. H. BIRCH, Prop'r.

119 Beale Street, San Francisco.

General Mechanical Engineer and Machinist. Steam Engines, Flour, Quartz and Mining Machinery. Sole manufacturer of Brodie's Patent Rock Crushers and Steel-Faced Tappits. Agent and Manufacturer of F. A. Youse's Patent Steam Packing Rings for Steam Pistons. The best ever invented; can be applied to any Engine Piston and give entire satisfaction to those using. Steam, Hydraulic and Sidewalk Elevators. Repairing promptly attended to.

### STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

THOMAS THOMPSON.

THORNTON THOMPSON.

THOMPSON BROTHERS,

**'49 AND '50.**

MR. JOHN VANCE CHENEY'S new historical story of early days upon this Coast will be commenced in the next number of "The Californian."

A NEW SERIAL STORY will be commenced in the next number of THE CALIFORNIAN which will run during the remainder of the year. It is entitled "'49 and '50," and is a story of early days upon this coast. The author is Mr. John Vance Cheney, whose articles in the leading Eastern magazines and in THE CALIFORNIAN have received such wide and merited recognition. Mr. Cheney has had this story in preparation for THE CALIFORNIAN for some time. Competent critics, to whom it has been submitted, pronounce it at once realistic and fascinating. The stirring events of 1849 and the succeeding year are vividly pictured. Absolute truthfulness of impression is sought rather than idealization. A thread of romance runs through the work, and the interest is sustained to the end.—(Note Book).

**NOW IS THE TIME TO SUBSCRIBE.**

"This magazine is only in its second year, but the merit shown renders it worthy of patronage from all parts of the country."—[Liberal Press, Woodbury, N. J.]

"An exceptionally bright periodical."—[New Haven Palladium.]

"A welcome visitor comes to us each month from the far off Pacific Coast. It is THE CALIFORNIAN, whose literary worth compares well with Eastern contemporaries. The January number is brimful of good things."—[Louisville Post.]

"There is a long list of attractive contents. It is an excellent number of a very good magazine."—[Philadelphia Inquirer.]

# MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.,  
Publishers.

SAN FRANCISCO, SATURDAY, FEBRUARY 5, 1881.

VOLUME XLII  
Number 6.

## The Richmann Belt Air Compressor.

In the PRESS of Dec. 4th last, we described in detail a newly-invented piece of California mining machinery, which was patented through the MINING AND SCIENTIFIC PRESS, Patent Agency by Henry Richmann. We refer to the Richmann steam power double-acting air compressor. On this page we illustrate another form of this improved apparatus, this one being intended to be driven by gear in belt form, or independent engine or water power. The Richmann belt air compressor is constructed on the same principle as the steam power compressor, excepting that it is driven by a belt connected with a pulley attached to the crank shaft, which is made long enough to allow an additional loose pulley if required. It occupies no more space than the steam power compressor, and from its lightness is easily transported. No air receiver is required to these compressors. They are simple in construction, compact, and the various parts so nicely balanced that there is no undue strain upon any one part.

In case water power can be had for driving compressors great economy is assured, as by an attachment to a water wheel the compressor can be run without the expense of fuel. These machines are made from 6x13 ft., compressing 75 cubic ft. of free air per minute, to run two 2½ inch or one 3-inch drill, up to 14x14 adapted to compress 349 cubic ft. of free air per minute and to run five 3-inch drills.

The water jacket around the air cylinder is arranged to keep a constant circulation of cold water, maintaining a uniform degree of temperature around the valves and the entire length of the cylinder. The air is thus forced into the supporting columns, (i. e. the receiver), in a perfectly cool state; and, as no water enters the cylinder, the air is delivered into the receiver free from moisture.

The valves open with the least pressure of the atmosphere, allowing the cylinder to fill up to its full capacity, and instantly close on the return of the piston.

This machine is very light and portable. It is unnecessary for us to go into details of construction and operation of the compressor, as we described its points in speaking of the other style in the article above referred to. These machines are made by the Richmann Drill Air Compressor Co., Nos. 25 and 27 Stevenson St., in this city.

**WHITE PINE REDIVIVUS.**—The Eberhardt & Aurora Co., of White Pine, has been re-incorporated and reorganized, with a capital of \$1,050,000, with which to prospect and work the company's property. The new company is called the Eberhardt Co. Limited. There was perfect harmony among the stockholders in adopting the new scheme, and a firm faith seemed to have animated them that old Treasure hill will yet show up a bonanza that will repay for all their long waiting and outlay. This news has instilled new hope among the people of Hamilton, and once more they look on the bright side of what a few weeks ago seemed utter darkness. The chairman in closing the meeting said: We have just sent a little more money to Captain Drake to drive along, because he was prepared to shut down, rather than incur any debt, and telegraph over here. We telegraphed to him at once that the meeting had passed the resolutions, and that we were just going to send him out money to explore, and I hope we shall get good results.

**THE** hullion shipments from neighboring mines through Wells, Fargo & Co's. office at Nevada City, for the month of January amounted to \$97,000. The Transcript says this is a light month's product, owing to the stormy weather that has recently interfered greatly with mining operations of all kinds.

**SAN BERNARDINO** is at present one of the most substantially prosperous towns in the State. Considerable building is going on, and the business men of the town and surrounding farmers are encouraged with the outlook for the season.

**THE Eureka Con. Mining Co.**, has declared the usual monthly dividend of 50 cents per share payable on the 20th.

## Nevada and Colorado.

The Con. Virginia mine, on the Comstock, has produced up to Dec. 31, 1880, the sum of \$64,970,777.95. Of this \$29,075,338.89 was gold and \$35,895,439.06 was silver, so it is not all silver by any means that comes from the Comstock, as many persons believe. The California mine also yielded last year \$890,515, of which \$247,728 was gold. This mine has also produced immensely, its total production has mounted up to \$46,742,718.17, of which \$23,310,281.98 was gold.

These two great mines have therefore pro-

duced 000; of the San Juan region, with \$500,000, and of Summit county with \$250,000 production. It may be as well for these same Colorado gentlemen to notice that the Comstock is by no means played out when any one mine can do as much as this in a year. It is only one of many too, but is the largest producer. If this mine was in Colorado, where Eastern capitalists would be apt to see it, no doubt it would be the most wonderful in the world. But as it is out here in the mountains of Nevada it is of small consequence. There has been more talk and more hundreds of columns of printed matter about the camps in Colorado previously mentioned as producing less than this one mine, than about the whole Comstock the past year. There are two or three newspapers in each camp, and to

THE RICHMANN DOUBLE ACTING BELT AIR COMPRESSOR.

duced \$129,720,559.05, a pretty round sum when carefully considered, and an amount it will take some extensively advertised camps a good many years to over-shadow. We speak of only two mines on the Comstock although there are many others which have produced many millions.

We hope some of the Colorado men, particularly, will take note of these figures, since they imagine that Leadville has already produced more than the Comstock. Leadville claims to have produced this year \$15,095,133; in 1879 it produced \$10,189,521; in 1878, \$3,152,925, and in 1877, \$555,330. From 1860 to 1880, both years inclusive, Leadville produced a little over \$35,000,000, a little more than half, in its whole existence, more than one mine alone on the Comstock produced. Consolidated Virginia only produced last year \$1,756,536.49, which amount is greater than that produced by any whole district in Colorado except Leadville, Gilpin county and Clear Creek. It is ahead of Boulder, which produced only \$1,000,000, or Rosita and Silver Creek, which produced \$1,000,000; of the Park county, with \$500,

read them one would imagine the mines were each producing millions. Colorado with its big Leadville mines ranks first this year in hullion production. California comes next and shows an increase, and will show a greater increase this year. With Colorado this is doubtful, however, as her Leadville mines will not do so well. Both California and Nevada may be kept in the memory of the Eastern mine investors therefore, as they have not gone clear out of sight by any means.

**PROF. THOMAS PRICE** says southwestern Nevada, and more particularly Lida valley and Gold Mountain districts contain some of the best mines in the State. The only drawback to their development is their inaccessibility, but that will be removed when the railroad south from Austin and the Carson & Colorado railway reach that vicinity. The State Lines series of mines, in Gold Mountain district, are very valuable properties.

A MINING expedition, composed mostly of young men, left Newport, R. I., the other day, for Atrato river, Panama.

## Foundry Notes.

The Fulton Iron Works has just finished a hoisting engine for the Tomhstone mine, Arizona. It is a horizontal, 35-horse power engine, supplied with two reels for hoisting, and capable of hoisting from a depth of 1,000 ft. with a steel wire cable. The cylinders are 9 by 16. The reels are five ft. in diameter, and have 24 inches space for the cable to wind on. The engine is supplied with all modern improvements in its class of machinery. Each of the reels has attached to it a dial, on which the progress of the cage up or down is recorded. Running at an average speed it will raise or lower the cage 1,000 ft. in two minutes. The mine is at present about 300 ft. deep. The entire structure, with bed-plates and other appurtenances, weighs, in round numbers, 30,000 lbs., and cost at the shop about \$7,500. Delivered at the mine it will have cost \$10,000, and possibly more. The boilers for supplying the engine with steam are already at the mine.

The demand for machinery from the Tomhstone district has not been confined to hoisting works. The Fulton Iron Works has already sent four mills for crushing ore to the district, and is just finishing a fifth. These mills are the Tomhstone, 10 stamps; the Corbin (belonging to the same company), 20 stamps; the Contentment, 25 stamps; and the Sunset, 15 stamps. The Grand Central mill, which is just being finished, has 30 stamps. An addition of five stamps is also being prepared for the Tomhstone mill.

The trial trip of the steamer *Estada de Sonora*, for the Mexican trade, was made the other day, for which vessel the Fulton Iron Works built boilers and engines. She was built in one of the northern coast shipyards and brought to this port under sail. She has a steam windlass and a steam engine for handling cargo, and they work to perfection. She is 167 ft. long, 28 ft. beam and 14 ft. depth of hold, and has accommodations for 45 cabin and 100 steerage passengers. She has compound engines; her high pressure cylinder is 20 inches in diameter, 30-inch stroke, and her low pressure 38 inches in diameter, 30-inch stroke, and a composition propeller 10 ft. in diameter.

In the case of John Lawson, agricultural claimant, versus Warren Hinsey et als., mineral claimants, C. L. Street, attorney for Lawson, has received the decision of the Commissioners of the General Land Office in favor of Lawson, deciding the land to be agricultural. The land embraced in the decision is near Reynold's ferry, Tuolumne Co., through which the mineral claimants have commenced running a tunnel for the purpose of turning the Stanislaus river, and thereby enable the working of about two miles of the bed of the river.

**THE** Clarence King party of geologists, statisticians, mineralogists and other scientists now at work on the Comstock expect to complete their labors in about two months more. They have made quite a long stay with us; some of the party have been here so long that we are beginning to look upon them as citizens of our town. We could not have a better class of men for citizens, and are ready to adopt them whenever they shall say the word.

**THE** Ontario, one of the big mines of Utah, has no superior in the country at the present time in profits and prospects. A grand total of \$3,150,000 in dividends has been paid to date. The mine has yielded nearly \$2,000,000 per annum since work fairly began, and for the year 1880 went ahead of those figures.

A NEW mining company is to be organized at Frisco, Utah, composed principally of practical miners, for the purpose of sinking a shaft 200 or 300 ft. deep, at a spot not yet determined upon. It is the belief of the best informed that proper development would show Frisco to be a second Leadville.

**THE** coinage of United States mints for January amounted to \$9,592,230, of which \$2,300,000 were silver dollars. The President has signed the bill establishing an assay office at St. Louis.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EWS

### Stirring Roasting Ores.

EDITORS PRESS:—Allow me to correct a few theoretical suggestions, made by a correspondent in the PRESS of Jan. 22d, respecting the use of wheels instead of hars in front of reverberatory roasting furnaces. Your correspondent, while saying that he thinks well of the plan, evidently considers the description of the introduction of wheels, as given in the late revised and enlarged edition of my work on "Roasting Gold and Silver Ores," as a proposed plan merely, and takes the trouble to relieve interested parties from imaginary difficulties, by suggesting improvements, ignoring facts. I first tried wheels in place of hars, in 1863, on a small furnace of 300-lb. charges, near Dayton, Nev., and, although the wheels were made only by rough blacksmith work, they proved greatly superior to the bars. Later I built, at Melrose, Alameda county, a long furnace provided with six working doors. In the middle of each door-frame was a wheel, which turned in a hole in the frame, but more toward the outside, so that when the door was shut the wheel remained outside, with the hoe in each; this obviated the constant lifting of the hoe. All roasters, who had practical experience in handling hoes, were delighted with the ease with which they could stir the ore with the aid of the wheel as compared with the bar. Subsequently I built two long furnaces in Mexico, each furnace was provided with five working doors, and these doors, having been cast in Mazatlan, were supplied with hars in front. The trouble which green Mexican roasters had caused me, induced me to replace the hars with wheels, and accordingly I ordered 10 of them at a blacksmith shop, and, not wishing to stop the roasting, the wheels were fixed outside, exactly as represented on page 68 of the treatise on "Roasting Gold and Silver Ores." The interested reader is referred to the Mexican works at Plomosas, Siuolaa, where the ore, at every point in the furnace, is conveniently stirred with all the "lateral movements of the hoe," although the wheels are attached on the front of the frame, as shown in the diagram in the book.

Finally, as to the suggested misapprehension of the sentence quoted from my book, which reads: "In place of the usual rollers in front of the working door, a far better contrivance (the wheel) allows the hoe easily to be directed to the required points, which is not the case with the roller bars"—will be readily understood by all practical men as meaning that with the wheel the hoe is easily directed, and with the bar it is not. The proposition is no longer theoretical, its soundness having been demonstrated at the works specified.

G. KUSTEL.

San Francisco, Jan. 25, 1881.

### Truckee and Quincy Railroad.

Short narrow-gauge lines will sooner or later tap the rich interior valleys, long isolated from a market, and connect them with the main railroads of the coast. On Saturday, January 1st, a large meeting was held at Sierraville, by the people of Sierra and Mohawk valleys to consider the advisability of building a narrow-gauge railroad from Truckee, Nevada county, through the valleys named, and to Quincy, Plumas county. Committees were appointed, and after full discussion of the subject, it was decided it was a needed and promising enterprise. It appears, from the Truckee Republican's report on the subject, that another meeting was held on January 3d, at which more complete statistics were offered. The proposed road extends through a section which is free from snow and landslides. No snow-sheds will be needed, nor are there such natural obstacles as would require heavy grades, deep cuts or expensive bridges. The resources to support the road are the heavy forests of Prosser creek, Sage Hen and Little Truckee, probably the best track of sugar pine in the State; the mines, present and prospective, of Independence, Mohawk valley, Plumas Buttes and other districts; and lastly, the grain, stock and other interests of large and beautiful mountain valleys, as yet but partially developed. Estimates of the freight at present to these mines and valleys place it at 40,000 to 50,000 tons annually. The prospects appear so good that a preliminary organization has been made, and stock is being subscribed in Truckee and in other towns, which will receive benefits from the success of the enterprise.

A glance at the map shows that the distance in a direct line between the terminal points of the proposed railroad is not more than 60 miles. The country to be opened up by such a line is one of the pleasantest and most healthful parts of the North Sierra region. There is no more beautiful region for tourists, hunters, botanists and lovers of the picturesque. The county of Plumas was settled at an early date, and its growth, though slow, has been steady and positive. For some kinds of fruits and for most kinds of berries, for vegetables, cereals and forage plants these mountain table-lands are unsurpassed. It is said that there are desirable openings for many more settlers on Government lands.

### Globe District.

#### Its Early History.

The Globe mining district, says the *Journal*, was organized on the 25th of November, 1875. It begins at a point where the supposed line of Los Carlos Indian reservation crosses Salt river; takes the course of the river to the mouth of Pinto creek; thence in a southerly direction to the Bloody tank on the trail from the Globe mine; thence along the summit of the timber range of the Pinal mountains to the Gila river, and up that river to the Carlos reservation.

The Pinal mountains are on the extreme north of Pinal county, and Globe district is north of this range of mountains—an admirable location—which gives it the benefit of the luxuriant growth of pine and fir timber which covers the sides of the range. Another benefit derived from these mountains is the numerous springs, which supply an abundance of water for both milling and mining purposes. If future developments should demand a larger supply, a road can easily be built to Salt river, a few miles north of Globe, where there is a sufficiency, not only for milling, but enough to furnish the power for 150 stamps. The river runs through a belt of timber, which could be cut and rafted down.

Globe has heretofore had to contend with a somewhat peculiar obstacle, and its effects have not yet disappeared. The mines

#### Have Been too Rich.

This may seem singular, but is susceptible of explanation. The reports circulated of the vast mineral wealth of the country have appeared to those unacquainted with the character of the district as little less than the dreams of an enthusiast—a mild edition of the tales of the Arabian Nights. One instance is sufficient for illustration: Some years ago, Mr. Estevan Ochoa was awarded the contract to deliver stores to the government posts in the vicinity of the district. On one occasion, while in camp, some of his mules were stolen by the Indians. He, together with his teamsters, gave pursuit. One of the latter, a Mexican, strayed into the district, and upon his return, greatly excited, he informed Mr. Ochoa that if he would come over toward the big water (referring to Salt river) he would show him a place where he could load his wagons with silver. Mr. Ochoa, supposing his teamster to be deceived, paid no attention to his offer. Some months afterward, J. C. Chilson, the discoverer of the Silver Nugget, passed down through the valley with his wagon with the

#### Almost Pure Silver Nuggets

Which had so excited the teamster. Seemingly exaggerated reports have actually driven persons away, whose aid might have greatly advanced the prosperity of the district. The means of communication in those days were exceedingly limited. Pack mules supplied the place of wagons and

#### A Horse and Saddle

Were the only facilities available for travel. A trip of 90 miles through pathless mountains was not inviting.

The opening of King's mine wrought a great change. A good wagon road was built from there to Florence, and a stage line started. A road was subsequently built from Globe to Florence, and the district was thence fairly under way. The original Globe country, as at first discovered, embraced the Pioneer district, in which is located the Silver King mine, the McMillan district, with the Stonewall Jackson mine, and the Mineral Creek, the celebrated mine of the same name. These were all parts of the same general lode, with the same geological features, which are readily traceable.

#### Mines.

In the district proper are the McMorris and the Nugget, which with the group of mines surrounding them is located in what is known as Richmond basin; the Centennial, the Stonewall, Cox & Coplin, Champion, Resene, California, Irene, Alice, South Alice and El Capitan, all of which are silver mines.

#### The Gold Belt.

Which lies west of the main silver belt, contains, among many other prominent mines, the Golden Eagle, the Townsend, parallel with the former, the one having a ten-stamp mill and the other five stamps running night and day, the Golden Gate and the Golden Star. The croppings all over the district disclose rich deposits of copper, with which the opening up of the country and the construction of railroads will doubtless be utilized. There are five mills now in operation in the district and four in course of erection. Many of the assays made from ore taken out of the mines are simply marvelous, and some of the mines have milled from \$500 to \$5,000 to the ton in lots of from 20 to 100 tons. Globe district is

#### Accessible by Three Routes.

Passengers from the west leave the cars at Casa Grande and take the stage for Florence, arriving there in time for dinner. From Florence there are two roads available. The visitor can go by Silver King, reaching the mine at 9 P. M., where he will get a good night's rest and have an opportunity to inspect that fine property. Leaving this point at 10 or 11 o'clock in the morning on horseback, he will travel 18 miles by the trail to the place where the stage line intercepts the pack train, about eight miles from Globe, reaching the town at 8 P. M. Or he may take the route by Riverside, leaving Florence at 2 o'clock P. M., and reaching Globe at 10 o'clock the next morning. By the latter

route he avoids the journey on horseback, but loses a night's rest and the chance of seeing the Silver King mine.

Passengers from the East leave the cars at Wilcox and take Stewart & Norton's stage line by Camp Grant, Camp Thomas and the San Carlos reservation to Globe. The time occupied by the trip is about the same over either route, but it is proposed, within a few weeks, to shorten the journey to 27 hours. There is little difference in the cost over any of the routes.

### New Amalgamating Works at Leadville.

#### The Taylor and Brunton Mill.

Prior to October, 1880, lead smelting was the only process of treating ore in Leadville, successfully adopted, lead ore being obtainable in sufficient quantities to mix with silicious ores and bring the percentage of lead in the mixture to the standard requisite for good smelting.

At times the supply of lead ore has been relatively very small and much uneasiness has been felt lest the production of lead-bearing ore should fall proportionately so far below the production of silicious ore, as to make it necessary to ship the latter to other cities for treatment—a course only practicable profitably for ores of the richer grades. In fact, this state of affairs had so far obtained, as to cause accumulations or "dumps" of lower grades of silicious ores, on Fryer and Carbonate hills alone, to the extent of not less than 20,000 tons; so held on the chance of their becoming salable at some future time.

There was, therefore, says the *Leadville Democrat*, needed some method other than that of lead-smelting for the home treatment of such ores, and the successful establishing of such a method, is a matter of importance and congratulation for Leadville, as well as for the lucky promoters of the enterprise.

The works for this purpose, known here as the Taylor-Brunton free amalgamating mill, were completed during the latter part of September, 1880, and are the property of the Leadville Gold and Silver Mining Co., a New York corporation, whose shareholders are principally prominent New York mining men. The designers and builders, Messrs. Taylor & Brunton, do not claim any patent process, but only an adaptation of the latest mill science, as known in Nevada and California, where such mills have been in steady use for many years, notably in Virginia City, Nevada. These gentlemen have been for ten years practically engaged in building, running and superintending mills in Nevada and Colorado, and are well known to most of the prominent men in the West, as thoroughly competent and experienced managers.

The Leadville Gold and Silver Mining Co.'s works are built in California gulch, on the line of the Denver & Rio Grande railroad, one-quarter mile below the city limits. This mill-site contains five acres well adapted to the business, securing a good contour for buildings, as well as bottom land for storing tailings, a full supply of water all the year, and reliable railroad communication via the Denver & Rio Grande railroad, which has run a side track to the center of the company's works, and there deliver coal and ores without transfer.

The improvements, besides the mill, consist of a comfortable dwelling, containing general business and assay offices; a stable and watchman's room adjoining; 2 ore sheds 18x92 ft.; coal platform with chute to boiler room; and blacksmith and carpenter's shop, completely fitted up for light machine work, such as gas-pipe cutting, hot mauling, etc. All these buildings cover 15,118 square ft., and are substantially built and roofed with iron.

The mill itself is put up on the terrace or "gravity" plan, the movement of ore in process of treatment being always down. The milling machinery was made by Prescott, Scott & Co., the prominent manufacturers of milling and mining machinery in San Francisco, after the latest patterns.

The method of treatment adopted is known as wet crushing, free amalgamating, and, as working in the Taylor-Brunton mill, may be described as follows, viz: The ore run from the receiving ore sheds, in a car of 1,000 lbs. capacity, is weighed enroute and dumped through Blake rock breakers, which crush to egg size, into a 50-ton storage bin, behind and above the stamp batteries. Close under the breakers' discharge, cutting the falling stream of ore 10 times per minute, there sweeps a small pan on the outer end of a three-ft. radial arm. The pan travels on a circular iron track, and on making a half circle from the crusher, upsets and dumps the ore caught in it from the stream under the crusher, into a large box, to be kept as a sample, showing the value of the ore run.

From the large storage bin the ore is fed to the stamps by automatic feeders, carried under them by a stream of water, and when crushed fine enough to pass through a hole made by a No. eight sewing needle, carried by the same stream of water out of the battery through the sizing screens into a series of 18 settling tanks, each 6x7 ft. and four ft. deep. From the last tank the water flows almost clear, and is pumped up to the stamps again for reuse. After the water is drawn off, the fine ore settled in the tanks, and resembling mud, is shoveled into the amalgamating pans.

The 20 stamps are arranged in four batteries, of five stamps each, with high double-discharge mortars. Each five-stamp battery runs independent of the others, driven by a separate friction pulley, which admits of the instantaneous starting and stopping of the battery. The

foundations and frames of all the hatteries are, however, connected both above and below, to distribute the vibration and give firmer and better resistance to the jar of the stamps, each of which weighs 850 lbs., and falls seven inches 82 times per minute. The 20-stamps crush from 40 to 100 tons in 24 hours, fine enough to pass through No. eight diagonal slot screens—screens for wet batteries are numbered in sizes the same as sizes of sewing needles.

By the concussion and grinding unavoidably following the frequent tremendous blows of the stamps, the striking surfaces, i. e., shoes and dies, are rapidly worn away and the drop of the stamp grows greater. To ascertain and regulate the amount of drop, it has been customary to remove the screens, clean out the mortars and block up the stamps from below to the requisite height, then setting them after two or three hours loss of time and labor. In the Taylor & Brunton hatteries a simple little machine saves this trouble, and without any stoppage of the batteries, tests and registers the "drop" of each stamp as fast as the register can be read. Some other improvements in these hatteries, such as balanced thrust of cam shafts, increased facility in reversing stems, etc., are too technical for description here.

The amalgamating pans are 10 in number of "Eclipse" pattern, five ft. in diameter and 40 inches deep, with steam bottoms to utilize the heat of the exhausted steam from the engine. This is found entirely sufficient to heat the pulp, and no live steam is required for that purpose. Into these pans the pulp (mud) from the settling tanks, in lots of 3,500 lbs., is charged and ground for some time, until fine end warm enough for the addition of the quicksilver. On putting the quicksilver into the pans, the mulers are raised and amalgamation commences, continuing until the precious metals are absorbed by the mercury. At this point the pan is tapped and its charge drawn down into a settler—an eight-ft. diameter tub—and the pulp made thin by adding water. The slow stirring of the settler keeps the mud in suspension in the water, but allows the heavier particles of amalgam and quicksilver to sink to the bottom where they are collected into a deep groove, running from the center of the settler to the outer edge of the bottom. From this groove the amalgam and quicksilver run in gas pipe to the securely-locked "amalgam safes," in which the surplus "quick" is strained off and the amalgam kept out of the reach of specimen hunters. From the settlers the muddy water and fine rock is drawn off into the "tailings sluice," and thrown away.

Each morning the amalgam from the straining sacks, inside the "safes," is emptied into a little car, weighed thereon and carried by it into the retort and smelting building. Nearly 1,000 lbs. of amalgam is charged into a retort—a heavy cast iron tube of 12 inches diameter, tamped at one end by a small gas-pipe—which is tightly closed and heated enough to vaporize the quicksilver contained in the amalgam. The quicksilver vapor passes out through the gaspipe into the "condenser," and by exposure to cold, changed back to its liquid state and ready for use again in the amalgamating pans. When the retorts cool, the now volatile gold and silver are taken from them, melted in plumbago pots and cast in iron molds, into ingots ready for shipment, by express, to the mint.

The system adopted to avoid handling the quicksilver is quite interesting. At the side of each of the ten amalgamating pans, is a little cast iron tank with quicksilver in it ready for use when wanted. At the proper time a faucet is opened and the "quick," drawn into the pan, and by the rapid stirring of the mulder, it is disseminated in small particles, all through the warm pulp, assimilating its precious metal contents. This duty accomplished, the pan charge is drawn into the settlers and thinned down, and the reverse operation commences. The slow motion in the settler allows the small particles of "quick" to settle and reunite. As fast as it collects the "quick" passes by an inverted syphon to the strainers, where it is divided, a portion going through the retorts as before described, and returning from the condensers to the pump well, and the rest separated by straining, is also collected by pipes into the pump well, whence it is pumped up back to the supply tanks near the pans.

The motive power for the mill is supplied by a 225 horse-power Buckeye automatic cut-off engine, coupled direct to the pan line shaft. A pair of Otis steel boilers 14 ft. by 54 inches, with every modern addition for saving fuel and increasing their durability, furnish steam for the engine and pumps. So far as the consumption of fuel carried that it is a rare thing to see any smoke coming from the boilers, though they are fired steadily with Canyon coal.

The mill throughout is scrupulously clean and orderly. It is well ventilated and sunshiny, even under the pans, where the gears and shafting run so quietly as not in the least to interfere with conversation.

**RICH ORE.**—The Taylor vein in the Concordia mine, lying 89 ft. west of the Concordia vein, and which was more fully described in these columns on the 7th instant, is growing larger and even richer as it goes northward. A sample taken from the north drift on Tuesday gave the following assay: Gold, \$4,731.67; silver, \$3,345.81. Total, \$8,077.67. The ore from this vein is being carefully sacked and stored at the Red Cloud works—*Bodie Free Press*.

## MECHANICAL PROGRESS.

## The Lead Bath in Tempering.

The employment of melted lead for heating steel articles preparatory to hardening is becoming much more common than formerly. Years ago melted lead was resorted to only when the article to be hardened was small in bulk and thin, or when the article was of greatly varying thickness. But as handiness in use came with experience the lead bath became a common means of getting the proper heat on articles of unvarying form and of quite a large size. The taps and dies which are produced in large quantities by some concerns manufacturing to order or for the general market, are now generally heated in the lead bath instead of over a charcoal fire. From the lead bath the articles come so clean and clear that the experienced operator does not require an after polishing to prepare for the drawing or tempering process even when the cooling bath is oil instead of water; the color being as well defined as when the hardened article is polished. The oil is readily removed by a momentary immersion in potash or soda water.

But it is necessary that the lead bath be of clean, pure lead; that made from the commercial pig is the best. It will not do to use old pewter, Rabbitt metal, or even old lead pipe. The bath should be made in a black lead or plumbochrome, or a pot made of boiler-iron or heavy sheet iron, and the lead should be brought to a blood-red color and kept there. To prevent oxidation and consequent waste the surface of the lead should be covered. Where the articles to be heated are of nearly uniform size plate of cast or wrought iron about a quarter of an inch, or even less, in thickness, may be placed on the surface of the melted lead, being of size and shape to nearly cover the lead, and through this plate may be made a hole sufficiently large to admit the articles held in a pair of tongs or suspended by a rod. Where the bath is to be used for articles of varying shape and size a thick sprinkling of charcoal dust is a good protection. If the bath is kept up at a good red heat it is surprising how soon its heat will be imparted to quite a large piece of steel. The process is a saving of time over that of the charcoal fire, and has the still greater advantage of producing a "suan" and even heat.

The chilling may be, of course, in water, a pickle, or oil, as the nature of the work requires. When the drawing or tempering is not done by the sand bath, the open fire or red-hot iron, it may in many cases be advantageously done by the lead bath itself. This is especially the case when some portion of an article wholly hardened, requires not temper but softness. Instances of this character are in the treatment of springs, a portion of which should be left soft, as when they are to be after worked for use. The lead bath will soften just that portion immersed without affecting the article for any further perceptible distance, as the bath heats the steel very rapidly without affecting the unimmersed portion. In thus softening over a fire the radiant heat affects the tempered article beyond the point desired. Springs of hardened brass wire may thus be softened where a portion is to be bent or riveted. A momentary immersion of the portion to be softened, and then a dip in cold water, will at once remove the spring-like rigidity of the wires.

There are many occasions not necessary to specify, when the lead bath will be found very handy. Every machine shop should keep a pot of clean lead on hand and ready for heating. Even in jobbing business and in the tempering of taps, drills, reamers, and even turning tools and planer cutters, the lead bath is a great convenience.—*Boston Journal of Commerce.*

**STUFFING BOXES.** Whether for the piston or valve stems, need to be looked after carefully, and to prevent leaking will require tightening from time to time. There are several kinds of ready-made packing in the market containing rubber, canvas, soapstone, asbestos and other substances which form the basis of a good durable packing. These can be had in sizes suitable for all ordinary purposes, and their use is recommended. In the absence of any of these, a packing made of clean manilla or hemp fiber will serve a useful purpose. Formerly it was the only substance used, but is being gradually superseded by the other kinds mentioned above. In packing the small and delicate parts, such as a governor stem, a good packing is made by plaiting together three or more strands of cotton candle wick. This is soft, pliable, free from anything like grit, and will not get hard until soaked with grease and baked into a brittle fiberless substance not easily described.

**MR. ABERNATHY** says that when upright posts are used, as is frequently the case in mills, to support the shaft, they should be secured with keys, top and bottom; the bottom keys to level up with, and the top keys to tighten with. By this kind of an arrangement the man in charge, when he finds his shaft getting out of level, can loosen the top keys, place his spirit level on the shaft, and drive up the bottom keys until it is right, tighten up the top keys and go ahead again.

**THE PHILOSOPHY OF WELDING.**—If iron were similar to other bodies, and a blow or sudden pressure produced heat all through the mass, the unexpanded liquid at the surface, as well as the interior plastic iron already expanded, would rise in temperature, the consequence of which would be that the molecular conditions at the junctions would still differ, although both at a higher temperature, and, therefore, molecular union could not take place. But if the liquid iron at the surface of the weld is in that condition of temperature that it would cool by pressure, the result is different, as the blow or pressure acts on this plastic iron to produce heat, and on the surface iron—which is on the borderland between liquidity and plasticity—to produce cold; consequently there is a moment when the temperature of the two would meet each other and render the molecular condition of the junction uniform and continuous. This appears to be a satisfactory explanation of the wonderful property of welding iron, and its counterpart in ice is the interesting phenomenon of regelation.—*L'Ing. Univ.*

**DURABILITY OF RAILS.**—The tests of the durability of steel rails on the Great Northern Line of England, show that the hardest rails do not wear the best. In one instance a hard rail was worn away one-sixteenth of an inch by a traffic amounting to 5,251,000 tons. A softer rail near by was worn the same amount by 8,402,000 tons. In another instance the total was 15,531,000 tons for a hard rail, and 31,661,000 for a soft rail, the wear and tear being the same—one-sixteenth of an inch. Analysis showed this last rail to consist of 99.475 per cent. of iron and minute quantities of carbon, phosphorus, silica, manganese, sulphur and copper.

WHEN a bar or rod becomes crooked, straighten it by pressure rather than by blows. The common way of allowing the bar to have its only bearing on the anvil is manifestly improper, as the suspended weight receives the full impact of the blow, and is effected in its entire length. The result is to compel the impact of the straightening blow to lift the entire dependent weight of the bar, thus adding to the force of the blow the inertia of this bar. The result, it is apparent, is a terrible straining of the bar just at the point of the blow of the hammer. There are several appliances for straightening shafting, bars, etc., in the market, which answer the purpose well.

**PREVENTING THE EXPLOSION OF STEAM BOILERS.**—An invention has recently been patented to prevent the explosion of steam boilers by placing a partition across the boiler slightly above the water line, providing an opening through this partition, which is adjustable, and through which the flow of steam can be regulated to be equal to the average intermittent flow required for the engine. It is claimed that this prevents dangerous variations of pressure on the surface of the water, hence preventing explosions. It is an American invention.

**MR. JOSHUA ROSE** says that an efficient method of locating a "pound" in a steam engine, is to place one end of a piece of 4-inch wire about eight inches long, between the teeth, applying the other end to each end of the crank shaft, hoarings, cylinders, etc., the violence of the shock in the vicinity of the pound being sufficiently the greatest to indicate its whereabouts. Mr. Rose remarks that all the mysterious "pounds" that annoy the engineer may be traced to a want of truth in the crank-pin, or a want of being in line of the main parts of the engine, usually the cylinder and main shaft.

**STEAM JACKETS.**—In order to secure the advantage of steam jacketing it is not sufficient to merely place around the cylinder a casing which may contain steam, care must be taken that this jacket always does contain steam. In other words, means must be provided for keeping the jacket clear of water and air. Too many jackets are "steam" jackets only in name, and hence the contradictory testimony which has arisen regarding their action. Few but those who have actually tried it fully appreciate how soon a jacket may be rendered ineffective by the accumulation of air and water.

**ALLOYS.**—Kraft's alloy for medals and coins—a composition which melts at 104° C; bismuth 5, lead 2, tin 1. Homberg's alloy for same, melting at 122° C; bismuth 3, lead 3, tin 3. Rose's alloy for same, melting at 93° C; bismuth 2, lead 2, tin 2. An amalgam to varnish plaster casts is made of tin 1, mercury 1, bismuth 1. The mercury is added to the molten metals, well united by stirring, and rubbed through the white of an egg. It forms a liquid mass, which is laid on with a small brush.

**AN IMPROVEMENT** on the furnaces of steam boilers has been patented at Birmingham, England, by which the bridging wall has openings upon the fireside with a hollow connection with the steam pipe or air pipe, which is led under the grate. A jet of steam is driven through the pipe under the grate which draws in air with it, and the whole is forced through the openings in the front side of the bridge wall. The idea being to ignite the unconsumed gases, making a very effective flame.

**MR. A. SHIELDS**, of St. Louis, is said to have discovered a process of converting Missouri pig iron into steel, which promises to be of great utility.

## SCIENTIFIC PROGRESS.

## Opinions as to the Origin of Petroleum Oil.

The manner of the formation of the deposits of mineral oil that occur so abundantly in this and other countries, is still involved in some doubt. The only statement that may safely be made concerning it, is that it is a product of the decomposition of animal or vegetable matter of former geological epochs. Some regard it as the product of the decomposition of land or marine plants; others, that it has been produced by the decomposition of animal matter; others again, that it is a species of coral oil, not formed by the bodies of the coral polyps, but sequestered by corals, principally of the Devonian age; others, that it is distilled from bituminous shales by subterranean heat, the shales being made up of the mud of lakes and estuaries that were once largely filled with vegetable and animal debris. Other authorities again, think that the true solution of the problem is not to look to one source only for the origin of petroleum. Dr. Lawrence Smith, for example, in discussing this subject, asserts that there can be no doubt that the primal sources of petroleum were both vegetable and animal; that the Pennsylvania and Virginia petroleum was derived almost exclusively from vegetable decomposition; and that those of Canada, and of Kentucky and Illinois, were derived principally from animal matter.

How the transformation of animal or vegetable matter into petroleum was effected, we do not know, further than that temperature and pressure were important factors in the operation. Prof. Peckham supposes that petroleum is the normal or primary product of the decomposition of animal or vegetable organism—chiefly the former—and that nearly all other varieties of bitumen are products of a subsequent decomposition of petroleum. Prof. Lesquereux attributes its origin to the partial decomposition of low forms of marine vegetation. The first named savant again affirms his conviction that the remains of animal life have contributed much more largely to the formation of petroleum than has generally been supposed; and further, that the different varieties of petroleum are largely due to the varied forms of animal life existing during the different geological epochs to which the rocks belong from which oil primarily issues. Dr. Sterry Hunt, a high authority, entertains similar opinions. He holds that the presence of the petroleum oils of Pennsylvania and Canada in the lower palaeozoic rocks, which contain no traces of land plants, shows that they have not in all cases been derived from terrestrial vegetation, but may have been formed from marine plants or animals. The latter view, he adds, is not surprising when we consider that a considerable portion of the tissues of the lower marine animals is destitute of nitrogen, and very similar in chemical constitution to the woody fiber of plants.

These abstracts of the opinions of eminent authorities will suffice to show that there is still considerable uncertainty as to the exact method by which petroleum has been formed. While some differences exist, however, in respect to the *modus operandi* of its formation, it will nevertheless be observed that all these authorities are agreed that petroleum is a product of the decomposition of organisms that have lived in early geological epochs. Beyond this fact, nothing has yet been determined with certainty. It may be added, in conclusion, that M. Berthelot, a distinguished French chemist, has presented an ingenious hypothesis in which he attempts to show that petroleum may have had a purely mineral origin; but his argument, though plausible, has found no supporters.—*Manufacturer and Builder.*

**PHOTOGRAPHS OF NEBULÆ.**—Janssens, in congratulating Draper upon his successful photograph of the nebula in Orion, recommends that the greatest possible number of photographs should be taken, in different observatories where there are suitable instruments and skillful observers, in order to provide for a systematic study of nebular changes. He has made preparations accordingly at Mendon, and he proposes to construct, upon a large scale, a telescope similar to the one with a very short focus with which he obtained, in 1871, a very luminous spectrum of the corona.—*Comptes Rendus.*

**NERVOUS VELOCITY IN THE LOBSTER.**—Fredericq and Vaudevel have been experimenting upon the velocity of transmission of the motive excitement in the nerves of the claw of the lobster. They used the graphic method, which was employed by Helmholtz in his researches upon the propagation of the nervous motor influences in the frog. In the winter experiments, at Ghent, with a temperature of 50° to 53° F., they found a velocity of about 20 ft. per second. In the summer experiments, with a temperature of from 62° to 68° F., they found velocities of from 33 to 40 ft. per second.—*Comptes Rendus.*

**THE TELESCOPE IN THE CELLAR.**—The late Prof. Watson, of the University of Wisconsin, was engaged, just before his death, in the experiment of gazing at the stars down cellar, on the principle that stars can be seen at noonday from the bottom of a deep well. He built his fine new observatory over a cellar 20 ft. deep, into which the light of the heavenly bodies was to be thrown down a large tube by powerful reflectors on a neighboring hill.

## Oil From Grape Seeds.

M. T. Fleury, of Bordsaux, France, has explained the method by which a very valuable oil is obtained from the kernels of the grape. The refuse left after distilling brandy or making verdigris is dried and ground fine in an ordinary mill, the yield of oil being in direct proportion to the fineness of the grinding. Some manufacturers first press without heat, obtaining about 5% of oil; afterwards the stuff is heated and pressed, with a yield of 10 or 15% more oil. The oil is of a light yellow color, and in course of time obtains a density of .9202 at 59° Fahr., and solidifies at 3° Fahr. Although it does not coagulate as soon as other oils, it becomes rancid and viscid when exposed to air, and although it saponifies readily, the soap produced lacks hardness and density.

Black grapes contain much more oil than white grapes, and the kernels of grapes from vines in full vigor yield more oil than from very young or very old vines. Generally black grapes give 15% to 18% of oil; white grapes 10% to 14%. It is probable that American vines, especially those of California, yield more oil than French vines. In the south of France 25 lbs. of kernels are allowed for 25 gallons of wine. It is easy to estimate the quantity of oil that is annually lost in grape-producing countries. The extraction of oil from grape kernels is by no means new. M. Fleury says that in 1880 there was a grape oil factory at Olby, which had been long in operation. Bergamo, Italy, produced the oil in 1770, and Roms and the vicinity of Ancona before 1782. It was also made in Naples on a commercial scale in 1818, and in Germany before 1787. The oil is sweeter than nut oil and remains fluid at a lower temperature. When burned in lamps it gives a bright, smokeless and odorless flame.

**A DISCOVERY IN THE POWDER LINE.**—The result of an important discovery was recently exhibited at Jersey City. It has been ascertained that the explosive quality in gunpowder may be temporarily removed by adding and thoroughly mixing in three times its weight of powdered glass. On the occasion referred to above, the gentleman conducting the experiment thrust a red-hot poker into a quantity of the powder so prepared, the only result being a steady and harmless combustion, as if so much punk had been ignited. The addition of four parts of glass to one of powder very nearly destroyed the properties of the powder, for saving that coming into immediate contact with the iron, none burned. The value of the discovery lies in the fact that upon subsequent sifting in a sieve, so as to eliminate the glass, the explosive quality of the powder is found to be apparently unchanged. It is claimed that the danger in handling, transporting and storing is entirely obviated. A fear seems to be entertained, however, that the use of powder, which has previously been thus treated, in shot-guns may tend to foul the guns. No assurance on this head is advanced by the parties most interested. The explanation of the above curious discovery is purely mechanical. The glass holds away one grain of powder from another in such a manner that simultaneous ignition is prevented. The above method of rendering powder in explosive has long been known, but some of the facts cited in connection therewith are both new and interesting.

**LIGHT AND ELECTRICITY.**—In 1874 W. C. Röntgen was led by observing that a glass plate which had been fractured by the electric spark become doubly refracting, to inquire whether a similar influence might be exerted by electricity without fracture. Kerr, Gordon and Mackenzie subsequently published a series of experiments upon the subject, none of which seemed very conclusive until Kerr's communications appeared in the *Philosophical Magazine* for 1879. Röntgen was then induced to experiment with various substances, and he found that transmitted light undergoes changes through electric influences which are precisely similar to those of ordinary double refraction. The intensity varies in the electrical field with the electrical force, and it increases with the difference of potential between the electrodes. By these experiments he has succeeded in thoroughly confirming the classification of fluids as positive and negative.

**RELATIONS BETWEEN CHEMICAL MASS AND HEAT OF COMBINATION.**—Berthelot finds that the elements which belong to any group, when they unite with any given simple body in order to form comparable compounds, set free quantities of heat which vary inversely with the chemical mass; the stability of the compound decreases in the same ratio. The decrease sometimes extends even to the change of volume which is produced by the combination of solid elements, when they form a solid compound. We are thus enabled to investigate the mechanical significance of the various relations.—*Comptes Rendus.*

**ADVANTAGES OF STEEL.**—Dr. Siemens, whose thorough competence is universally known, claims that in every case when strength and magnitude are both required the use of steel is without a rival. He asserts that even for an ordinary house steel gives more security than wood, is six to eight times as strong, and costs less. He thinks that before many years elapse we shall see steel introduced into buildings of all kinds, and that it will gradually supplant iron, in the same way that iron already tends to take the place of wood.—*L'Echo Industri.*

The new 40-stamp mill of the Saverool mine, Butte Co., has been completed, and is now running. The company have an abundance of ore that can be brought to the mill at little expense. The yield has been about \$6 per ton, but no care was taken of the sulphurets, which it is thought will increase the yield to about \$10.

## The Mining Share Market.

They are beginning to think now there will be no "stock market" until spring, and as a Pioche paper said lately with regard to a promised spring rally, "it is the same thing every year now." Even those who have money that they want to put into stocks are not now investing. They see no reason for taking bold of any particular stock at present, and should they buy on general principles are liable to get their money in at the wrong point; also, may catch an assessment or two before anything "comes to a head." This being the case most dealers are awaiting the time when the operations at present in progress in the leading mines shall show developments giving promise of workable ore bodies.

The Virginia Enterprise thinks that in the meantime there are liable to little spurts at various points. The large joint Mexican and Ophir east winze has now but about 50 ft. to go to reach the 2700 level, and from that point the drill may show something to put a little life into stocks at the north end. Also, something favorable may unexpectedly be encountered at some point on the lode to put life into the market, but it will be two or three months yet before we can look for anything from the main and heavy work in progress at the north end, middle mines and Yellow Jacket and Belcher series.

At the Union Consolidated mine No. 7 drill hole from the bottom of No. 1 winze has been discontinued and No. 8 started. Little is expected of this, as the ground in which it is being run is washing worse than was the case in any of the other holes.

As soon as a proper sump has been made at the bottom of the Union shaft the station at the 2600 level will be opened and a drift started for the bottom of No. 1 winze. Explorations by means of crosscuts from the bottom of No. 1 winze will make us acquainted with the true character of the ground penetrated by the drill and of which we now know next to nothing.

The Union Con., situated on the northwest slope of Bodie bluff, has struck, at a depth of 150 ft., a vein 10 ft. in width giving assays averaging \$100.46. The other drifts were made in the south drift, 512 level, of the Noydau. This drift followed the ore vein (usually about 30 inches wide and of fair milling grade ore) 330 ft., where it came into an ore running away \$100 to the ton. In going 8 ft. farther this vein widened to 6 ft. of clean ore, all of it being of very high grade. The prospective value of this strike is greatly heightened by the fact that immediately above this body, on the 412 level, the ore vein was 35 ft. wide, though not of as high grade as on the 512 level. The Bodie shows a still further improvement in the quality of the ore. This is due to the fact that the bulk of the ore extracted during the week was taken from and below the 6th (inclined) level, which proves conclusively that the Fortuna or east vein is growing richer as it descends. The Standard has not reached its ore bodies on the 1,000 level, progress with the crosscuts being slow on account of lack of hoisting power. Goodshaw is storing ore and shipping to the Miners' mill, which was started up Saturday evening. The Silver Hill mill also started up on Saturday evening last, on custom ore. The Spaulding mill will start, on Spaulding ore, about the end of the present week. The Syndicate is turning out a steady stream of bullion. On Sunday some very rich gold and silver ore was struck in the Jupiter mine—the gold passing through and projecting out of the rock in sheets. Boston Con., is stripping from the 250 level in from 3 to 4 ft. of good ore, while the vein followed 305 ft. on the 800 level proves to be from 3 to 4 ft. wide of good milling ore.

## NEVADA.

**LONE RIDGE MIN.**—*Transcript*, Jan. 20: About one-third of the pipe iron shipped via this city for the Lone Ridge hydraulic claim yet remains at the depot here. The delivery of the iron is being made by the Lone Ridge company already delivered is being put together at Oak Tree ranch, and, with the 3,500 ft. of the same size pipe—15-inch—already owned by the company, will be used to convey water from the Milton ditch to the claim, a distance of about 11,000 ft.

## PLUMAS.

**SAVYKOOT.**—*Greenville Bulletin*, Jan. 27: The new 40' stamp mill is running.

**GOLD STRIP.**—Steadily and surely the regular routine of work progresses at this mine and its mills, giving every indication of an unflinching supply of pay ore.

**SOUTHERN EUREKA CON.**—By the last of this week the new 10-stamp mill of this company will be all completed and ready for operations. It is constructed, and the machinery is a credit to the Greenville Iron Works.

**CHICKADEE.**—The weather has been more favorable for operations at this mine; the roads have been constantly improving, and the hauling of ore has been again resumed. The mill will be started in a day or two, we hope for a steady run. Additional silver plates have been provided for the sluices, and increased returns may be expected in consequence. As the weather is looking better, the mill is working well. The Orefield shaft is being put down rapidly. The new pump would handle 5 or 6 times the quantity of water thus far encountered, with the greatest ease.

**GREEN MOUNTAIN.**—Both mills have run without interruption during the past week, and with good results. No. 5 tunnel is showing a fine copper-stained ore in the main pay chute. A large body of water was encountered here, and was making it necessary to suspend operations temporarily, but work has been resumed, the excessive quantity of water having come from the old shaft and works above, and abating when those works were drained. The known extent of this main body of pay, taken in connection with the improved quality of the rock at the increased depth, gives assurance of a most prosperous career for the Green Mountain during many years to come. This shaft is fortunate in containing such a property.

## SHASTA.

**COPPER CITY.**—*Redding Independent*, Jan. 20: The extra mill at Copper City commenced running last Friday. It is thought that the present storm will compel them to again shut down on account of not being able to secure enough wood.

**F. S. Monaro**, Secretary of the Northern Light, was up not so long ago, but was unable to examine the mine, owing to too much water.

## SIERRA.

**BLACK JACK.**—*Mountain Messenger*, Jan. 20: Supt. J. W. Young, of the Black Jack quartz mine, 5 miles east of Downsville, near the head of Jim Crow, and R. Oliver, Esq., of Forest City, visited the Sierra Buttes quartz mine last Tuesday, and inspected the mill and underground workings, all of which were found in good shape. They report the tunnel at the Black Jack in 200 ft. through talcose slate, and as it advances the rock is easier to blast. The shaft are steadily making 25 ft. in 24 hours. The ledge is expected to be tapped 540 ft. from mouth of tunnel. Seven men are employed. Five ft. of snow at that point before the storm, at an altitude of near 6,500 ft. They are well provisioned for the winter, and all other supplies are on hand to prosecute operations until the opening of the roads in the spring.

**HARD ROCK.**—It is reported that hard rock has been encountered in the Ruby tunnel. This will not make much difference with the progress of the work, as the steam drill works about as well in hard as in soft rock, and the bulk of the labor is required to get the drift away.

**B. M. Ex.**—The Bald Mountain Extension Co. are still in gravel with their tunnel with no signs of bedrock. How far they are above bedrock has not yet been determined. The top gravel prospects very well in fine gold.

## TUOLUMNE.

**ROUGH & READY.**—*Tuolumne Independent*, Jan. 20: The Rough & Ready gravel mine in Table mountain, at Peoria flat, is doing well. Mr. Brisky, who discovered the "break out" from the rim rock by a number of cuts, followed into the mountain on the pay gravel with a large force of prospecting tunnels and finds a pay channel of immense proportion in width, also in depth, for the character of the rock is the same as the channel, and this point seems to have backed up so as to expose a face of the vein 50 ft. high. It is the intention of the gentleman from San Francisco, who bought the property, to put on hydraulic works, wash the outside area as far as the basalt will permit and drift up and down the old channel under the lava with a large force of miners. The purchaser, after a short run for prospecting, is said to have washed up enough to have paid for the first cost of the property. The Dutch G. M. Co., on the mother vein proper (adjacent to the Heiler at quartz mountain) have struck a splendid body of ore. Where they worked in the crosscut the vein was 5 ft. wide, and in drifting 45 ft. the vein widened out about 10 ft.; splendid clay and footwall. Vein at this point is all free gold, and will probably go from \$20 to \$30 per ton. A company has started a shaft on the "Dunella" mine, at Amador. A son of Ben Butler is opening up a gravel mine on the Stanislaus, below Peoriaflat.

## YUBA.

**PROSPECTS.**—*Marysville Appeal*, Jan. 20: Judging from observations made during a somewhat extended tour through the foothill regions, the mining prospects of Yuba county have not been so promising for years as at the present time. At Brown's Valley the 10-stamp quartz mill, erected last season, is running day and night, and the returns have been so satisfactory that several new lodes are now being developed, and new mills are in contemplation. Immense quantities of gold were taken out there in early days, and the people are very sanguine that the flush days of the Yuba are just beginning to dawn again. At the Indian Ranch are 2 quartz mills, recently erected, already under way and the other nearly completed. High assays have been made from the rock of several ledges; capital is flowing in, and the people are confident that this will, at no distant day, be one of the busiest camps in the Sierras. At Smartsville, which, by the way, is one of the prettiest little towns in the State, the usual number of men are employed in hydraulic mining, but immense bodies of high grade gravel promising to yield their golden treasure in the future as they have done in the past. Just over the line, in Nevada county, near Spenceville, a 4-ft vein of quartz-

bearing silver is creating no little excitement, 2 assays having been made of the rock, each showing at the rate of more than \$100 to the ton. Near the Calaveras Patch a party of prospectors are now at work on a gold-bearing quartz ledge that they seem confident will pay handsomely.

## NEVADA.

### WASHOE DISTRICT.

**CALIFORNIA.**—*Gold Hill News*, Jan. 30: During the week there have been extracted and sent to the mills 369 tons of ore, the average assay of which was \$21.41. In the office there is a bill for the value of \$29,311.65. On the 2500 level the south drift from the Ophir line has been extended 89 ft.

**CON. VIRGINIA.**—During the week 450 tons of ore have been extracted and sent to the mills; assay value, \$19.78. Bullion in office, \$10,048. On the 2300 level the south lateral drift has been extended 23 ft.

**OSUR.**—On the 2500 level the joint Mexican east winze has been sunk and timbered 12 ft., and a tank pit is being cut out at the 2000 level. On the 2500 level the joint Mexican west crosscut has been extended 14 ft.

**SILVER HILL.**—On the 2300 level the upraise has been advanced 20 ft.; total, 500 ft. The north drift, 2500 level, has been advanced 10 ft.; total length, 410 ft. During the past week but 39 6-10 tons of ore were raised.

**MEXICAN.**—On the 2500 level the joint Ophir east winze has been sunk and timbered 12 ft., and are cutting out a pump and tank pit at the 2000 level. The joint Union Con. east crosscut has been extended 32 ft.

**UNION CON.**—On the 2500 level the joint Mexican west crosscut has been extended 20 ft., the joint Mexican east crosscut 32 ft., the joint Sierra Nevada east crosscut 50 ft., and drill hole No. 8, from the bottom of winze No. 1, 175 ft.

**UTAH.**—Since last report the east drift on the 1050 level has been advanced 12 ft. The ground still continues hard. On the 2150 level the east drift has been extended 21 ft.; the ground is soft.

**HALE & NORCROSS.**—The frame of the main hoisting works is up, and the carpenter and blacksmith shops closed.

**UNION SHAFT.**—No sinking was done during the week; repairing drill at 1600 level, cutting out bob-pit at 2200 level, and casting timbers at the 2300 station.

**ALTA.**—During the past week the shaft has been sunk and timbered 35 ft.; total depth below the 1550 level, 125 ft.

**SILVER HILL.**—Last Sunday morning the pinion to the pumping engine gave out, which stopped the pump 62 hours, and the water raised in the incline 120 ft. The water was out Thursday morning, but owing to the great heat nothing could be done in the winze toward slaking.

### BELMONT DISTRICT.

**WILL RESUME OPERATIONS.**—*Belmont Courier*, Jan. 30: John P. Curtis, Superintendent of the San Antonio and Jett mines, informed us on Monday last that now companies are being organized in the East, and that work will be resumed in the San Antonio and Jett mines on the 1st of May. During the past week the shaft has been sunk and timbered 35 ft.; total depth below the 1550 level, 125 ft. and other districts north and south, to develop their properties in good shape. (Quick transportation and a reduction in freights are what the people of this section need.)

**BARCELONA ORE.**—Three tons of Barcelona ore, shipped to Eureka recently, worked \$150 per ton; 4 tons mixed with screenings worked \$117 per ton. There are large quantities of richer ore in sight in this mine. We understand that the owners of this valuable property will put up reduction works at Spanish Bell in the spring.

### CHERRY CREEK DISTRICT.

**GROWING.**—*White Pine News*, Jan. 29: Cherry Creek is receiving fresh additions to its population by every day. We make the prediction that another year will find us one of the most prosperous mining camps in the State.

The Star company paid off last Saturday. The monthly pay-roll of the company reaches \$14,000, and the total cost of operating the mill and mine is \$30,000.

The price of real estate is visibly raising in Cherry Creek. Lots that a few months ago could be purchased for \$20, are now commanding up in the hundreds. Rents also have an upward tendency. All of which is an indication of the good times ahead.

SEVERAL loads of the new machinery for the Ticup mill arrived this week from the railroad, and will at once be placed in position. The mill building is fast approaching completion.

**BULLION SHIPMENTS.**—The Star company made the following bullion shipments, through Wells, Fargo & Co., during the past week: Jan. 25th, 5 bars, valued at \$2,300; Jan. 27th, 2 bars, valued at \$1,600; total, \$3,900. The Exchange company shipped 1 bar, valued at \$1,400, on the 25th.

### EUREKA DISTRICT.

**EUREKA TUNNEL.**—*Eureka Sentinel*, Jan. 20: Owing to the impure air in the header of the Eureka tunnel, they can work but 1 shift in 24 hours at the present time, but a change for the better in this respect is evident within the past few days. This is accounted for by the change of formation. The tunnel is now in 1,610 ft., and the head of the tunnel is upward of 1,000 ft. below the surface. The ore indications are more favorable at the present scene of labor than they have been for the past 800 ft. They are out of the shale entirely, and are working in a mixture of clay and spar.

**THE GRANT MINE.**—There are hundreds of good mines on Prospect mountain and the surrounding hills, which, if worked by experienced miners, could be made to pay more than \$4 per day. Many of them could be leased on favorable terms. We have 1 in mind now. It is the Grant mine, on McCoy hill. Some time ago Messrs. Jerry McCallum, Sam Bell, A. L. Conery and John Cuff secured lease of the mine. They worked it to good profit, but as the warm days of the past few weeks have revived the desire to travel, and as Bob Waters and brother had a liking for the looks of the mine, they sold out their lease to the Waters Bros. The mine remains in the hands of the lessees for 10 months longer. The Grant ore has always been of high grade, and we understand that its yield promises well from the present outlook.

### GRANTSVILLE DISTRICT.

**THE BROOKLYN.**—*Cor. Grantsville Bonanza*, Jan. 29: In the Brooklyn line of development in lower level advances without interruption. By a winze west of incline we have connected with 1st level, thus giving complete ventilation, and now everything is in line order to furnish ore for 20 stamps, or as many as the Alexander company can spare.

**COLIN PARK.**—The San Francisco mine is down 35 ft. from the croppings, with assays from bottoming, \$41.23 silver and \$17.50 gold. In the Arctic we are running a tunnel which will tap the lode in about 100 ft. At 40 ft. from the mouth we passed through a blind lode, 2 ft. wide, of fine decomposed quartz, average assays \$105 gold and a trace of silver. In North Star, average assays, \$10.03 silver and \$105.62 gold.

### GOLD MOUNTAIN DISTRICT.

**PROSPECTS.**—*Esmeralda Herald*, Jan. 20: From a gentleman just from Gold Mountain we learn that the prospects are good for a considerable time. A live camp with the prospect of a big strike. The company owning the mines is making every arrangement for active work, and by April or May will have things running in good shape. The mine contains a large body of gold ore that assays sufficiently large to insure a good profit, and there are prospects of the camp becoming a permanent one. The company is engaged at present in bringing water to work the mines from a distance of over 13 miles, and is laying out 50 men in the town.

### MAITLAND DISTRICT.

**FORMING THE DISTRICT.**—*True Fissure*, Jan. 29: On Wednesday of last week a meeting of the miners and claim owners of Maitland mining district was held. F. Schofield was elected Chairman and J. H. Turner, Secy., John Powell was elected Recorder. Maitland district

comprises the greater part of the old Walker Lake district, and is bounded as follows: On the north by the old canal tract, beginning at Silver Star district and running to the southeast end of Walker Lake; on the west by the line of the Carson & Colorado railroad and the Alum creek wagon road; on the south by the Carson and Columbus toll road, and on the east by the Black Diamond district. The district lies principally on the north side of the range of mountains north and west of what is known as the Marietta range. The minerals in the district are copper, silver and gold, with the former in preponderance. In fact copper mining will be the leading feature, and the near advent of the railroad will make many hitherto valueless veins worth money. Mr. Turner and his partners have made 4 locations called the Lacy Bortram, Peacock, Rainbow and the Johnny-come-lately. Considerable work will be done in this district during the spring and summer, and it bids fair to make a stir in the copper mining interests of the county.

### RED MOUNTAIN DISTRICT.

**VEINS.**—*Cor. True Fissure*, Jan. 27: The Red Mountain mining district, from personal inspection, appears to be a network of ledges, many of which by judicious location can be made valuable. Good opportunities are offered to the prospector and capitalist. The ledges being gold, upon development, will find ready purchasers. A great many claims have been formerly held by location fiends, who go about gobbling up good, bad and indifferent ground. They then sit down with the fond expectation of selling out, without doing a tap of work on their claims, or waiting for other claims to be developed that they might sell out through the energy of, and risking neither capital or labor.

### MOUNT CORY DISTRICT.

**TIK MINES.**—*True Fissure*, Jan. 29: Mount Cory district is situated about 45 miles from here, 6 miles south of Mount Grant, and 6 miles west of the main line of the railroad town on Walker Lake. The district lies between Mount Grant and Mount Cory, and the auriferous ores are found in fissure veins in a micaceous or syenite granite of a soft character. The Golden Eagle claim has 100 tons of ore out, and a little depth indicates that the dip of the vein will change from east to west. All the veins in the district carry fine gold, and the ore is easily reduced. There is one fine improvement, with something like a galbladder, owners of the Big Indian claim, purchased a small grinding pan in Bodie and took it to Mount Cory. The first charge they put in was 500 lbs of ore, which yielded \$60 in gold worth \$17 per ounce. Subsequent charges gave similar returns. What is needed in the district is a 5-stamp mill to do custom work, as most of the claim owners are poor men, but have plenty of rich ore in sight to enable them to prospect their several claims if they could get returns for their ore. At present there are but 3 companies working in the Mount Cory district proper, but several others are operating at Mount Orant, 6 miles north, and about Squaw creek, 6 miles south. The country thereabouts has not been prospected to any extent, and yet it is said to be full of gold-bearing quartz veins.

### PIOCHE DISTRICT.

**TRAO DULL.**—*Pioche Record*, Jan. 29: A number of our miners, carpenters, artisans and even business men are talking of going to Arizona, where work is supposed to be plenty and business fair. There is very little show here for any class at present. Business men are comparatively doing nothing, and the general outlook is gloomy. There is no chance for any man in Pioche, or hardly in Lincoln county, to look forward to pay-days, for very few men are now working in the county who are under a regular salary outside of county officials. There are some few watchmen employed to look out for mines and mills, and some few men at El Dorado Canyon who are employed in the mines and mills there, but, with these exceptions, the balance are living on hope. Everything that is good is expected to turn up in the future, but the camp this spring, and so we have lived for several years past.

### SILVER CANYON DISTRICT.

**PROSPEROUS.**—*White Pine News*, Jan. 23: Ed. Cannon came in from Silver Canyon Thursday evening. He reports the present condition of affairs prosperous. The mill is running nicely and producing good bullion. He says that Dr. Brooks and the people generally over there have unbounded confidence in the future of the camp. Ed. is a whole-souled, genial fellow, and will remain with us a short time.

## ARIZONA.

**GLOBE DISTRICT.**—*Silver Belt*, Jan. 22: Rose, Mason & Jaeger are at work on the Big Injun, Black Hornet and Silver Bow group of mines. They exhibit some very fine ore, assaying from 200 to 400 ounces per ton. This group of mines is located opposite the Cox & Coplin mines in "Tarantula" hill, in which some 10 or 12 veins and strata center. W. W. Palmer, favorably known among mining men of Nevada, was with us last week and had occasion to visit the Stonewall mine, owned by Mr. Joseph Chapman & Co. He pronounced it a good mine, and, after thorough examination of the same, was of opinion that it ranked among the foremost mines of our Territory. Mr. Riotte also examined this mine and classes it as the most promising mine in the district. The owners of the Julia mine are sinking a shaft with a view of striking the ledge at a depth of about 75 ft. This lode is the one on which the Centennial mine is, and adjoins it on the north. The Julia's shaft is only 150 ft. from that of the Centennial's.

**TOMBSTONE.**—*Nugget*, Jan. 29: Yesterday the purchase of the Sunset mill, on the San Pedro, was effected, the property passing into the hands of the Head Center Con. M. Co., of which Thomas E. Farish is superintendent in this city. By this transaction the production of bullion in this camp will be largely increased at once. The bullion production in our camp will be increased at least \$100,000 per month, for the Head Center is one of the most valuable properties in the district. Messrs. Carpenter & Vimont yesterday refused \$25,000 cash for the Peacock group of mines, acting under instructions from the owners, who have placed said group, consisting of 6 mines, in the Dragoon mountains, in their hands for sale at a stated figure. Gentlemen put up more cash or some other parties will take the cash.

**PROSPECTS.**—*Cor. Tucson*, Jan. 30: There is no time in the history of this camp that the mines have looked better or the town more prosperous. At present the town is filled with the best of mining men that can be found on the coast. The Three Brothers mine is now down about 95 ft., and they are taking out \$1,000 rock. The Bob Ingersoll is showing up most satisfactorily at a depth of 50 ft. In about a week we will have the whistle of the Empire again. The Emerald is now down about 125 ft. and the ore is wonderfully rich and in a large body. There is another rich strike reported on the Junata. The Randolph Co. have entered into a contract with the Boston mill to work 300 tons of ore. In the Bradshaw they are taking out excellent ore at the depth of 260 ft. They are taking out excellent ore at the partnership shaft of the Tough Nut and Mountain Maid. The Horns mine will begin in a day or two, and the ore from the Three Brothers mine. The old Sunset mill will begin crushing Head Center ore in a few days.

**PIONEER DISTRICT MINES.**—*Pinal Drill*, Jan. 29: A big strike is reported in the Emma mine, in Arnet's canyon. The work on the Gem is going on and the mill will soon be running. Work on the Two Brothers is progressing. Supt. Nettle reports that they are taking out good metal in the shaft. The Surprise tunnel is now 906 ft. long. They are sinking a winze on the vein in gold ore, where the vein is over 30 ft. wide and are getting ready for a big mill. The Lewis is piling big black stuff on an enormous dump.

**SADDLE MOUNTAINS.**—John Wroughton is in town and brings good news from the Saddle. He says the Wheeler is down 70 ft. and they are taking out splendid ore, improving as they gain depth. They are lowering the work on the Golden Eagle. Down 100 ft. and splendid rock. Work has commenced on the Cliff mine, belonging to Wroughton & Co. He is enthusiastic over the prospect. The hills are full of prospectors and new discoveries are made every day.

**SANTA CATARINAS.**—The Acorn mine, adjoining the Cottonwood, has sent us some fine specimens. The Acorn is owned by F. O. Wilkinson & Co.; the assay value of the ore sent is \$317 and \$562. They have found a gold ledge 4 ft. wide close to the Acorn, owned by Chas. Weiser and Wilkinson. The Muro mine has furnished us samples \$18 and \$20 in gold, and \$10 to \$12 silver. This mine is in Catalina. There is plenty of fine timber and water on this mountain. There is sometimes a confusion in the names of Santa Catalina and Santa Catarina. We understand that the same name mountain. Catalina is in Pinal, Catalina is in Pima.

## COLORADO.

**BALAZAR ITEMS.**—*News and Courier*, Jan. 22: Bilar has been looming up of late, and is fast assuming its time appearance. The recent cold weather has interfered materially with the successful running of the mill, although they have been able to accomplish considerable thus far. It is reported that the St. Julian has been sold for a very good price. The Good Hope is being worked by Messrs. Schreiber, Sherman and Waterman, and they are taking out some very good ore.

**SUNSHINE.**—Business in our town just now is scarcely active. No rush or prospecting by outside parties. The Ozark tunnel company keep steadily at work in their crosscut, having passed through 2 valuable veins, still continuing on to reach the 4 others of their group yet remaining. The tunnel is now in 420 ft. The Golden Age Con. mining company, on this range on the north side of the county road, have their tunnel in 70 ft., running on the Comstock lode, and expect soon to recommence work. These are our western frontier mines, well up on the slopes of Big Horn mountain, our silver-bearing belt. The eastern line of our Sunshine mines may be represented by the Emancipation, Western Slope and Dana, the slide line distance about a mile and a half. These mines are steadily worked, the Emancipation by the Emancipation, Jackson, Turner Bros., the Western Slope under lease by Stewart Lewis, Bay & Pervis, and the Dana, also under lease, by Mr. Kelley. Numerous prospects also developed claims be between on this south line, but very few being worked just at this time. Among these, just west of the Grand View, is the Boulder Valley, owned by Cook, Thomas, Coffee & Rosegarner. This claim pays expenses of development, and is being improved, with something like a private pocket distribution. The Washburn, in the center of the camp, owned by Smith & Sons, is working under lease and getting out some fine ore in paying quantity.

## IDAHO.

**YANKEE FORK.**—*Evening*, Jan. 20: The machinery for the roasters at the Custer mill will soon be here, when crushing will be commenced, and a large force of men put to work in the mines. Ore of great richness is now being taken out of the Montana mine. It is filled with gold and silver. The lower tunnel of the Charles Dickens is in nearly 600 ft. and running in a good breast of excellent ore.

**WOOD RIVER.**—*Cor. Salt Lake Tribune*, Jan. 20: Walker & Hart, merchants of this place, have a claim about 1 mile east of town, which they leased to parties a few days since, and when they had blown the cap off at a depth of about 2 ft., they came upon a 5-ft. ledge, much of which assays from \$300 to \$700 to the ton. This gave a new impetus to prospecting in this region, and several fine prospects are being developed. It has been thought that all our best mines in this neighborhood were on the west side of Wood river, but these new developments show that there are good mines running through the hills for a distance of 6 or 8 miles above and below town on the east side of the river. This will undoubtedly give Bellevue a permanence and an importance as a mining center that her most sanguine friends did not expect.

**SNAW MOUNTAIN NEWS.**—*Cor. Idaho World*, Jan. 29: The prospects of this camp commence to look flattering again. The Rising Sun looks better to-day than it ever looked, and there are about 100 tons of first-class rock on the dump. The men at work in the mine are taking out, on an average, 1 ton per day to the man. The ledge in the tunnel is about 2 ft. wide and looking well. In the shaft that the men are now sinking there is a 2-ft. ledge that prospects well. The tunnel has run in on the ore body now between 80 and 90 ft. Another tunnel has been started to tap the ledge 100 ft. deeper. The Paymaster also has started again. Mr. Plowman has begun work on the North Star, and intends to take out a run of rock by spring time.

## NEW MEXICO.

**VERA CRUZ.**—*Las Cruces Thirty-Four*, Jan. 20: The "V" mine, at White Oaks, is said to be a very valuable property, having an average run of ore, in gold, of \$17.65 to \$19.55 per ton, and can be mined and milled on a 100-stamp mill at a cost not exceeding \$1.50 per ton. The owner, F. A. Blake, is negotiating a third interest to Cleveland capitalists. If the trade is consummated a \$100,000 stamp mill will be placed in Nogal canyon early in the summer.

The Mal Pais mining district, in Lincoln county, is developing into remarkable richness. The carbonate beds appear to be of almost limitless extent and depth. Shafts have been sunk to various depths, from 80 to 200 ft., and all show up well. The dirt all pays, but there are 3 principal pay streaks. Assays generally run from \$10 to \$150, though some tests have gone up to the thousands.

A rich strike is reported at White Oaks by parties who were digging a well. Assays return \$800 in gold and \$2.50 in silver from the dirt taken from the well.

MINERS from the Mogollons bring in the most encouraging reports. Work on most of the mines is being rapidly pushed forward and new discoveries are every day made.

An old tunnel on the Rebel Chief, in Colfax county, has been cleaned out and exposed to view a pay streak 6 to 10 inches wide showing free gold along its entire length. It is said that 6,000 tons of ore are in sight in this mine, and machinery is shortly to be erected for working it.

## OREGON.

**QUARTZ LEADS.**—*Pineville Pioneer*, Jan. 20: Ochoo quartz is beginning to attract attention, and within a few days the men in the vicinity of where operations are now being prosecuted, will become as lively a mining camp as can be found anywhere. Some beautiful gold and silver-bearing rock has been brought in during the week from the Last Chance shaft and Ochoo O. & S. M. Co.'s tunnel, some of which has been taken to Portland for assay. The Last Chance shaft has been sunk to the depth of 40 ft., and the active operations will be resumed in the spring. The shaft has been sunk on the ledge the entire depth, varying from 2 to 6 ft. in width, and rich in gold and silver throughout. Mr. Thompson, who has the contract for running the tunnel, informs us that he is now in a distance of 200 ft., leaving 70 ft. yet to be worked, at which point it is expected the main ledge will be struck. These leads are new specimens of many others we have in Wasco county, once taken up by men too poor to develop. Of course we need capital, and eventually it will find its way to the Ochoo mountains.

## UTAH.

**A PROSPECTING COMPANY.**—*Southern Utah Times*, Jan. 29: The organization of a prospecting company of practical miners and capitalists is now being agitated. It will be the purpose of this company to sink shafts in various places in and around Frisco for the determining the exact character of the ground upon which Frisco is built. The same conditions and surface showings existing in and around Leadville, Col., surround this camp, and there is every indication of the existence of vast carbonate deposits under us.

**HORN SILVER SHIPMENTS.**—In a recent issue we stated that the product from this mine in 1880 footed up \$559,185.40. It should have read the number of ounces, which, at \$1.10 per ounce, together with \$210,000 worth of unrefined lead, makes the correct amount. Wells, Fargo & Co.'s report includes \$11,000 worth of gold which is not part of the Horn Silver mine product. The shipments during the past week foot up eight car-loads.

## Physical Studies of Lake Tahoe.—No. 6.

[Written for the Press by PROF. JOHN LE CONTE.]

## Cause of the Blue Color of Certain Waters.

The preceding considerations very clearly indicate that the real cause of the blue tints of the waters of certain lakes and seas, is to be traced to the presence of finely-divided matter in a state of suspension in the liquid. We have seen that Sir I. Newton, and most of his successors as late as 1869, ascribed the blue color of certain deep waters to an inherent selective reflecting property of its molecules, by which they reflected the blue rays of light more copiously than the other rays of the solar spectrum. Since the researches of Soret, Tyndall and others, this selective reflection has been transferred to the finely-divided particles which are known to be held in suspension in greater or less abundances, not only in all natural waters, but even in the most carefully distilled water. When the depth of water is sufficiently great to preclude any solar rays reaching the bottom, then the various shades of blue which are perceived under similar conditions of sunshine, will depend upon the attenuation and abundance of materials held in suspension; the purity and delicacy of the tint increasing with the smallness and the degree of diffusion of the suspended particles. Moreover, it is evident that Tyndall is quite correct in assigning to "true molecular absorption" some agency in augmenting "the intense and exceptional blueness" of certain waters; for it is obvious that the "blue of scattering by small particles" must be purified by the abstraction of the less refrangible rays, which always accompany the blue during the transmission of the scattered light to the observer. It seems to be very certain that were water perfectly free from suspended matter and coloring substances in solution, and of uniform density, it would scatter no light at all. "But," as Tyndall remarks, "an amount of impurity so infinitesimal as to be scarcely expressible in numbers, and the individual particles of which are so small as wholly to elude the microscope," may be revealed in an obvious and striking manner when examined by a powerfully concentrated beam of light in a darkened chamber. If the waters of the lakes and seas were chemically pure and optically homogeneous, absolute extinction of the traversing solar rays would be the consequence if they were deep enough. So that to an observer floating on the surface, such waters would appear as "black as ink," and apart from a slight glimmer of ordinary light reflected from the surface, no light, and hence no color would reach the eye from the body of the liquid. According to Tyndall, "in very clear and very deep sea water, this condition is approximately fulfilled, and hence the extraordinary darkness of such water." In some places, when looked down upon, the water "was of almost inky blackness—black qualified by a trace of indigo." But even this trace of indigo he ascribes to the small amount of suspended matter, which is never absent even in the purest natural water, throwing back to the eye a modicum of light before the traversing rays attain a depth necessary for absolute extinction. He adds: "An effect precisely similar occurs under the moraines of the Swiss glaciers. The ice is here exceptionally compact, and owing to the absence of the internal scattering common in huddled ice the light plunges into the mass, is extinguished, and the perfectly clear ice presents an appearance of pitchy blackness" ("Hours of Exercise in the Alps"; "Voyage to Algeria to Observe the Eclipse," Am. Ed., N. Y., 1871, pp. 463-470). In like manner the waters of certain Welch tarns, which are reputed to be hot-tempered, are said to present an inky hue. And it is more than probable that the waters of the Silver spring, whose exceptional transparency has been previously indicated, would, if they were sufficiently deep, present a similar blackness, or absence of all color by diffusive reflection.

## Cause of the Green Color of Certain Waters.

It remains for us to explain the cause of the green tints which the waters of certain lakes and seas assume under peculiar circumstances. These green colors manifest themselves under the following conditions, viz: (a.) In the finest blue water, when the depth is so small as to allow the transmitted light to be reflected from a bottom which is more or less white. Thus, a white sandy bottom or white rocks beneath the surface of the Lake of Geneva, or the Bay of Naples, or of Lake Tahoe, will, if the depth is not too great or too small, impart a beautiful emerald green to the waters above them. (b.) In the finest blue water, when a white object is looked at through the intervening stratum of water. In the blue waters of the sea this is frequently seen in looking at the white helms of the porpoises, as they gamboled about a ship or steamer. In a rough sea, the light which has traversed the crest of a wave and is reflected back to the eye of the observer from the white foam on the remote side, sometimes crowns it with a beautiful green cap. In March, 1869, I observed this phenomenon in the magnificent ultramarine waters of the Caribbean sea. A stout white dinner plate, secured to a sounding line, presents various tints of green as it is let down into the blue water. Such experiments were made by Comte Xavier de Maistre, in the Bay of Naples, in 1832; by Prof. Tyndall, in the Atlantic ocean, in December, 1870, and by the writer in Lake Tahoe, in August and September, 1873. (c.) In waters of all degrees of depth when a greater

amount of solid matter is held in suspension than is required to produce the blue color of the purer deep waters of lakes and seas. Thus, Tyndall, in his "Voyage to Algeria to observe the Eclipse," in December, 1870, collected 19 bottles of water from various places in the Atlantic ocean between Gibraltar and Spithead. These specimens were taken from the sea at positions where its waters presented tints varying from deep indigo blue, through bright green to yellow green. After his return to England, he directed the concentrated beam from an electric lamp through the several specimens of water and found that the blue waters indicated the presence of a small amount of suspended matter; the bright green a decidedly greater amount of suspended particles, and the yellow green was exceedingly thick with suspended corpuscles. He remarks: "My home observations, I think, clearly establish the association of the green color of sea water with fine suspended matter, and the association of the ultramarine color, and more especially of the black indigo hue of sea water, with the comparative absence of such matter." ("Hours of Exercise in the Alps"; "Voyage to Algeria to observe the Eclipse," Ed. cit. ante, pp. 464 et 467.)

There is one feature which is common to all of the three above indicated conditions, under which the green color manifests itself in the waters of the lakes and seas, viz: When a white or more or less light-colored reflecting surface is seen through a stratum of intervening water of sufficient purity and thickness. Condition (a.) is obviously included; for it is evident that a background of suspended particles may, under proper conditions, form such a reflecting surface.

Inasmuch as under these several conditions, more or less of the transmitted light is reflected back to the eye of the observer, it is evident that the rays which reach him carry with them the chromatic modifications due to the combined influence of the selective absorption of the water itself, and the selective reflection from the smaller suspended particles. Hence, the chromatic phenomena presented, being produced by the mingling of these rays in various proportions, must manifest complex combinations of tints, under varying circumstances relating to color of bottom, depth of water, and this amount and character of the suspended matter present. In the explanations of the green color of certain waters by the older physicists, we recognize the full appreciation of the influences of selective reflection in the production of the phenomena; but they seem to have overlooked the important effects of the molecular absorption. We have seen that Sir I. Newton regarded the green tints of sea-water as due to the more copious reflection of the violet, blue and green rays, while those constituting the red end of the spectrum are allowed to penetrate to greater depths. ("Optics," loc. cit. ante.) Sir H. Davy ascribes it, in part, to the presence of iodine and bromine in the waters, imparting a yellow tint, which, mingled with the blue color from pure water, produced the sea-green. ("Salmonia, Collected Works," Vol. 9, p. 201.) In like manner, Count Xavier de Maistre, ascribed the green tints to the yellow light, which, penetrating the water and reaching the white bottom or other light-colored submerged objects, and being reflected and mixed with the blue which reaches the eye from all quarters, produces the green. ("Bibl. Univ.," Vol. 51, pp. 259-278, Nov., 1832; also Am. J. Sci., first series, Vol. 26, pp. 65-75, 1834.) On the other hand, after Bunsen, in 1847, had established that chemically pure water extinguished the rays of light constituting the red end of the solar spectrum more copiously than those of the blue extremity, so that the transmitted tints were more or less tinged with blue, some chemists were inclined to attribute the green color of certain waters to the presence of foreign coloring substances. Thus Bunsen himself explained the brown colors of many waters, especially of the north-German inland lakes, as produced by an admixture of humus; but he considered the green tints of the Swiss lakes and silicious springs of Iceland as arising from the color of the yellowish bottom. (Vide, loc. cit. ante, p. 44, et seq.) Similarly we find that Wittstein, in 1860, from chemical considerations, concluded that the green color derives its origin from organic admixtures, because the less organic substance a water contains the less does the color differ from blue; and with increase of organic substances the blue gradually passes into green, and ultimately into brown. This is likewise the view taken in 1862, by Beetz, for he insists that in all waters the observed color of the liquid is that of the transmitted light, and not, in any case, of the reflected light. Moreover, he maintains that Newton, De Maistre, Arago and others, were mistaken in classifying water among those bodies which have a different color by transmitted light to that which they have by reflected light. (Loc. cit. ante.)

We have already shown that if the waters were chemically pure and perfectly free from suspended particles, the red rays of the traversing solar light would be first absorbed and disappear, while the other colored rays pass to greater depths, one after the other being extinguished in their proper order, viz., red,

\* Similarly, Arago has very ingeniously applied the same principles to the explanation of the varying colors of the waters of the ocean under different circumstances, showing that when calm it must be blue by the reflective light, but when ruffled the waves acting the part of prisms, refract to the eye some of the transmitted light from the interior, and it then appears green. ("Comptes Rendus," tome 7, p. 219, July 23d, 1838.)

orange, yellow, green, blue and violet, until at last there is complete extinction of the light in the deeper mass of the liquid. But the presence of suspended particles causes a part of the traversing solar light to be reflected, and, according as this reflected light has come from various depths, so will the color vary. If, for example, the particles are large, or are abundant and freely reflect from a moderate depth, and prevent reflection from a greater depth, the color will be some shade of green.

When the water is shallow and a more or less light-colored bottom, or a submerged object reflects the transmitted light to the observer through the intervening stratum of liquid, it is evident that the chromatic tints presented must be due to the combined influence of the selective absorption of the water itself, and the selective reflection from the smaller suspended particles.

In other terms, under these conditions, the tints are produced by the mingling of the blue rays with the yellow, orange or red; so that the resulting hues must generally be some shade of green. In short, all the facts established by modern investigations seem to converge and point to the admixture of the blue rays reflected from the smaller suspended particles with the yellow, orange and red rays reflected from the grosser matters below, as the true physical cause of the green tints of such waters.

## Harmony of Views.

The establishments of the very important function of solid particles held in suspension in water, in producing chromatic modifications both in the scattered light and in the transmitted light, serves to reconcile and to harmonize the apparent discrepancies and contradictions in the views of physicists who have investigated the color of water.

We have already seen that Sir I. Newton and most of his successors, as late as 1847, regarded water as belonging to the opalescent class of liquids, in which the diffuse reflected light and the transmitted light present more or less complementary tints; the former partaking more of the colors constituting the blue end of the solar spectrum, while the latter presented more of the hues belonging to the red extremity. On the contrary, the more recent and more accurate experiments render it quite certain that in distilled water the rays of the red end of the spectrum are more copiously absorbed than those of the blue extremity; so that the emergent transmitted tint is yellowish green or greenish blue. At first view, these results appear to be discordant and irreconcilable; but, it will be recollected, that while even the most carefully distilled water contains a sufficient amount of suspended matter, to scatter enough light, to render the track of the traversing concentrated solar beam visible, yet, in this case, the selective reflection of the blue rays, due to the suspended particles, is not adequate to neutralize the selective molecular absorption of the rays toward the red end of the spectrum. Nevertheless, as has been previously shown, the addition of very minute quantities of diffused suspended matter confers on distilled water the dichroic properties of an opalescent liquid.

The presence of an exceedingly small amount of suspended solid corpuscles, by selectively reflecting the shorter waves of light, is sufficient to neutralize and overcomes the selectively absorbent action of the molecules of water on the longer waves; and thus, to impart yellow, orange or red tints to the transmitted beam. Moreover, it is very questionable whether any natural waters are sufficiently free from suspended matter to deprive them of these dichroic characteristics.

Under this aspect of the subject, the views of Newton, derived from the observations of Halley, those of Hassenfratz deduced from his own experiments, as well as the explanations of the green tints of certain waters given by De Maistre, Arago and others, completely harmonize with the conclusions deducible from modern researches, provided the property of selective reflection is transferred from the aqueous molecules to the finely-divided particles held in suspension.

As a striking illustration of the slight causes which sometimes transform the purest water into an opalescent or dichromatic liquid, it may be interesting to detail one of my own experiences. On the 21st of Dec., 1878, the series of glass tubes employed in my experiments (as previously indicated), being filled with distilled water, the transmitted solar beam presented when received upon a white screen in a darkened room, the usual yellowish-green tint of my winter observations. On the 24th of Dec., or after an interval of three days, during which all parts of the apparatus had remained *in situ*, I was much surprised to find that the transmitted solar beam was enfeebled, and presented an orange red color with no tinge of green. Puzzled to discover what could have produced so marked a change in the optical properties of the liquid, the "scientific use of the imagination" pictured the possible development of ultra-microscopic germ, infusoria, bacteria, *confervae*, etc. The next day (Dec. 25th) the same phenomenon presented itself, when I called the attention of my assistant, Mr. August Harding, who had kindly prepared the arrangements of the tubes, to the anomalous change that had taken place in the color of the transmitted beam. He suggested that, as he had used alcohol in cleaning the glass plates, closing the ends of the tubes, and as the plates were secured to corks by means of Canada balsam, the alcohol absorbed by the corks, being gradually diffused, dissolved some of the bal-

sam, which solution, mingling with the water, might produce a fine resinous precipitate, which might stifle the transmitted beam and scatter the rays of shorter wave length, thus leaving the orange-red rays predominant in the emergent light. This view was speedily verified by a critical examination of the track of the traversing beam. A sensible turbidity was visible, in the darkened room, at the extremities of the column of water adjacent to the corks securing the glass plates; and the light diffused laterally at these portions, when examined by Nicol's prism, was found to be distinctly polarized. The emergent beam, examined by the spectro-scope, exhibited orange and red in full intensity; but the yellow and green were greatly diminished. Ten days later (Jan. 2, 1879) the solar beam traversing the same column of water emerged much brighter than on Christmas day, and the tint was orange tinged with yellow and red. This long repose caused, doubtless, some of the resinous precipitate to become more generally diffused, or to subside, and thus diminished the turbidity of the liquid. The recognition of the dichroism imparted water by the presence of finely-divided particles in suspension, serves, likewise, to harmonize the conflicting views promulgated by physicists who have studied the chromatic phenomena presented by this liquid. Some claim that the rays of higher refrangibility are more copiously withdrawn by absorption; while others maintain that the rays of longer wave lengths are more absorbed. In many cases the chromatic tints ascribed to selective molecular absorption are unquestionably due to selective diffuse reflection from the ultra-microscopic corpuscles which are held in suspension (Vide Jamin's "Cours de Physique," 3d ed., tome 3, p. 447, et seq.).

**RESOURCES OF THE STATE.**—An act to provide for the practical exposition of the resources of the State of California is the title of a bill introduced by Wasson, the member from Mono, and which was referred to the Committee on Agriculture. The Governor, assisted by the State Mineralogist, State Engineer and the Professors of Agriculture and Geology at the University, is to be the director of the work contemplated by the act. These officers and employees of the State, and other specialists who may be chosen by the Governor, are to produce works of a practical and popular nature descriptives of the agricultural, mineral and other resources of the State, treating such subjects as soil and climate, productiveness of the soil, forests, water supply, irrigation, mineralogy and kindred topics, the whole to be illustrated by proper maps and charts. The first treatises are to be prepared from the data and figures already available, and are to be arranged in volumes for publication and sale. Afterward, beside these special works, an annual report of the resources of California, in pamphlet editions, is to be prepared and distributed throughout the United States and foreign countries as the Governor may direct. A general map of the State, together with atlas-sheet detail maps, shall be compiled and published also, which are to be illustrative of the topography, the agricultural and mineral resources of the State. The detail maps shall be sufficiently large to admit of their adoption as county maps, and they shall be furnished to the county officers of the State. The sum of \$20,000 is appropriated for the expenses of the work during 1881 and 1882. The employees of the State or of its institutions shall receive no compensation for their share of this work, except for traveling expenses.

**TO KEEP LAMP CHIMNEYS FROM CRACKING.**—The following recipe for keeping lamp chimneys from cracking is taken from the *Diamond*, a Liepzig journal devoted to the glass interest: Place your tumblers, chimneys or vessels, which you desire to keep from cracking in a pot filled with cold water, add a little cooking salt, allow the mixture to boil well over a fire, and then cool slowly. Glass treated in this way is said not to crack even if exposed to very sudden changes of temperature. Chimneys are said to become very durable by this process, which may also be extended to crockery, stoneware, porcelain, etc. The process is simply one of annealing, and the slower the process, especially the cooling portion of it, the more effective will be the work.

**MATERIAL FOR FLOOR CLOTHS, WATERPROOF GARMENTS AND STEAM PACKING.**—A material has been patented in England for a compound which consists of silicate, cotton dress or slag mixed with rubber. For floor cloths three parts of cotton are mixed with one of india rubber in solution, and the substance is rolled out and allowed to dry. For packing rings the proportions are similar, the compound being rolled and formed into a roller, which is then vulcanized, from which the rings are cut. For a waterproof cloth the proportions are about equal, being spread over the linen fabric in the usual way.

The old ore slopes of the California and Con. Virginia are holding out wonderfully well. Several times in the last year it was thought that but little more ore could be obtained, but always—just when a pay streak was thought about to peter out—a widening or strengthening has occurred just in the nick of time.

A CANAL is proposed from Bordeaux to N. Orleans in France, and is very likely to be constructed. It will be about 250 miles long, the locks allowing the passage of vessels over 400 ft. in length.

## THE ENGINEER.

**RAILROADS IN EUROPE AND THE UNITED STATES.**—In a few weeks the Atchison, Topeka and Santa Fe railroad will form a junction with the Southern Pacific railroad, when we shall have two complete railroads from California connecting with the East. From present indications, there will be, within five years, no less than four railroads extending from the Pacific to the Eastern States on United States territory. There are not less than 92,000 miles of railroad in operation in the United States. This is almost as many miles of railroad as are found in all Europe. Fifty millions of people in the United States have accomplished as much in railroad-building as have three hundred millions in Europe. Still we are considerably indebted to the older countries for capital in these enterprises. Perhaps some of them would have better understood their interests if they had kept some of their money at home and build railroads of their own. If, however, their loss is our gain, we need not complain that they have failed to realize as fully as we have the value of railroads to a country.

**GRAND NARROW-GAUGE RAILROAD PROJECT.** Nearly \$1,000,000 has been raised to aid in the construction of the St. Louis and Texas narrow-gauge railroad, a line which is now being built from Texarkana to Waco, Texas, which it is designed to extend from the former point to Cairo, Ill., there to connect with a narrow-gauge road to St. Louis. It is also intended to push the road from Waco to the Rio Grande, to connect with the Palmer-Sullivan system, which is to be constructed to the City of Mexico, under concessions lately obtained by General Palmer, of the Denver and Rio Grande road, from the Mexican government. It is also in contemplation to ultimately build a narrow-gauge road from St. Louis or Cairo to New York, and thus have a continuous narrow-gauge line from the latter place to the City of Mexico. A syndicate has been formed in New York to carry out this grand project, and sufficient money to complete the road is said to have already been raised. The line between Cairo and Texarkana is to be finished in the course of a year, as the work of construction will be pushed from both ends.

**BUSINESS ON THE SUEZ CANAL.**—It is reported that the traffic returns of the Suez Canal Company for October show the receipts to have been \$628,000, against \$439,919 in the same month of 1879. In the first ten months of the year the increase is from \$4,865,039 to \$6,633,660. The tonnage at the end of September amounted to 3,283,851 tons, and as the traffic is most active during the last three months of the year, it is believed that the tonnage by the end of December will easily exceed 4,000,000 tons. M. De Lesseps, in his argument for the canal in 1855, wrote: "It might be argued without exaggeration that almost the whole of the freight to the East will take the route of the canal." The estimates, however, were not based upon that presumption, and De Lesseps presumed that but half the shipping would pass through the isthmus. He therefore estimated the amount of tolls to be earned on 3,000,000 tons.

**HOOSAC TUNNEL LIGHTED BY ELECTRICITY.**—Experiments with electric light in the Hoosac tunnel have proved that a light can be thrown strong enough to do track work within the tunnel, free from smoke, and the men working at from 500 to 1,000 ft. from the light. With the tunnel choked with locomotive engine smoke the light penetrated the smoke, as nearly as could be judged, 10 times as far as that of the ordinary oil headlight. The tunnel is to be lighted within a few days by 12 electric lights, using a turbine wheel at the east end of the shop for motive power. The wire to be used for connecting the lights with a dynamo machine is a new process or patent, and is, we understand, the invention of Prof. George Mowbray, North Adams, a successful man with nitro-glycerine.

**THE ENGLISH CHANNEL TUNNEL.**—The French Government has extended for three years the concession for the preliminary work on the proposed Channel tunnel to connect England and France. The original concession was made in 1875, for five years. So far all the geological evidence, and especially that derived from the experimental borings, has proved to be highly satisfactory. It is questionable, however, whether in the event of a favorable termination of the preliminary work, it would actually be undertaken exclusively by private enterprise, by reason of its enormous costliness. In such an event, doubtless the two governments interested in its execution will be asked for, and will grant the enterprise, substantial assistance.

The British railways during 1879 carried no less than 502,732,890 passengers. Of these only 38,967,174 were first class, and 63,430,844 second class, while 460,334,872, or more than eight-tenths, were third class. The receipts from the first class were £3,900,000; from the second class, £3,500,000; from the third class, £14,600,000, or about twice as much as both the other classes combined. These figures are striking evidence of the advantageous result of increasing the facilities afforded to third class travelers, and also suggest very strongly that low passenger rates are in the end more profitable to the railways than excessive rates.

## USEFUL INFORMATION.

## Corn as Fuel.

The failure of railroads in being able to furnish coal for fuel in our wide prairies in western and northern Iowa, and more especially Minnesota, the question of fuel for the future is being seriously discussed. It appears to be generally conceded that corn can be raised so cheaply and will make as good fuel as any other substitute. We have tried it. Corn in the ear makes a good and durable fire, and can be burned in either hard or soft coal stoves, and is especially choice fuel for the cooking stove. An acre of corn can be raised for about \$6, including the rent of the land. Fifty bushels of corn will weigh 3,500 lbs., or equal to a ton and three quarters of soft coal. This, at 15 cents per bushel (which is as much as corn is worth on the farm away from railroads this winter), would be as cheap for fuel as soft coal at \$4 per ton. Two bushels of corn will make a fire which will keep a family warm all day, even each winter as we have had since the commencement of holidays. There can be no question of morality in the theory. Corn can be easily and conscientiously planted to raise fire wood, as any tree or plant. Some recommend raising sunflower for firewood, but it is not as good as corn. Nor need this talk about burning corn create any reluctance to removing to regions where they have to burn corn for fuel. It can be raised in one-tenth of the time and at less expense than timber can be raised for the same purpose. And until we have more railroads, or roads of greater capacity, farmers on our wide prairies will have to burn corn. Be it understood, however, it will not take a very great emergency to induce them to do it.—*Iowa State Register.*

**PRESERVING WOOD.**—The improved French method of preserving wood by the application of lime is said to work well. The plan is to pile the planks in a pile in the tank and to put over all a layer of quick-lime, which is gradually slacked with water. Timber for mines requires about a week to be thoroughly impregnated, and other wood more or less time, according to its thickness. The material acquires remarkable consistence and hardness, it is stated, on being subjected to this simple process, and the assertion is made that it will never rot. Beechwood prepared in this way for hammers and other tools for ironwork is found to acquire the hardness of oak, without parting with any of its well known elasticity or toughness, and it also lasts longer.

**MANUFACTURE OF SPOTTED YARNS.**—A recent English invention in which a yarn is made of two or more continuous threads and of a number of short detached pieces of soft slubbing or roving so twisted together that at certain intervals globular or spheroidal knobs are produced, all or some of which contain either a color or a material not contained in the intervening space between the knobs. The rollers and roller driving mechanism is very different from that of the ordinary spinning and doubling frames. The carrier rollers are driven continuously, and the ground and floating rollers intermittently, one at a time, according as the driving wheel is in gear. This driving wheel is covered by a cam plate. The whole arrangement can be attached to any spinning or drawing frame.

**VARIETIES OF A TON.**—A smelter's ton of copper ore is 21 cwt., and weighs 2352 lbs., the manufactured copper being sold at 2,240 lbs. to the ton. Coke for a run-out fire is bought 2,000 lbs. to the ton. A ton of pig iron for a forge is 2,268 lbs.; blooms being sold at 2,464 lbs. to the ton, and 2,700 lbs. constituting a ton of refined metal. Coals on this continent are bought at 2,240 lbs. to the ton, and retailed at 2,000 lbs. to the ton. In England, they are always bought and sold at 2,240 lbs., except at Newcastle, where they are shipped by the chaldron of 30 cwt., of 3,380 lbs., and Newcastle coals are to-day so bought and sold at Quebec, Canada.

**BLEACHING OF STRAW.**—Dissolve 108 grams permanganate of potash (crystals) in 5 liters of hot water. Mix this solution in a tub of water until the water is a deep red. Enter straw which has previously been softening for several hours in a tepid bath of soda and well rinsed. Agitate in the straw frequently. It will turn deep brown; if not, add some permanganate solution; leave it in till discoloration of the bath. When the straw is of a drab shade, rinse in cold water and enter in a bath of sulphurous acid. Make it of a sufficient degree to emanate odor. The discoloration of the straw takes place within 30 minutes, and generally turns a good white.—*Textile Colorist.*

FIFTY years ago when a man could make but 14 coins a minute, people used to take care of them, and when they got bent they straightened them out and made them serve again. Now, 14,000 can be made in a minute, and people are perfectly reckless in their use. Europe makes 80,000,000 daily, and the United States 51,000,000, so the daily loss may be figured at 131,000,000.

**IRON MOUNTAIN, Mo.,** is all that its name implies, being seven-tenths the pure iron. It is nearly a mile long, half a mile broad and several hundred ft. high. It is being carted away at the rate of 850 tons a day.

A SOLDERING fluid which does not occasion rust is prepared in the following manner: Small pieces of zinc are immersed in muriatic acid, and left in it until the acid is saturated with it, which may be known by the cessation of ebullition of the acid, and also by the zinc, added after that stage, being left undissolved; add spirits of ammonia, about one-third of the quantity of the acid; thin with a little quantity of rain water. When, at the time of adding the zinc, the muriatic acid is heated to a low degree, the solving of the zinc will be achieved sooner. This fluid does not cause rust on iron or steel, and is excellent for all purposes, even for tinning.

**CEMENT FOR MARBLE.**—Sift plaster of Paris through muslin, and mix with shellac dissolved in alcohol or naphtha. As soon as mixed apply quickly, and squeeze out as much of the composition as possible, wiping off that which squeezes out before it sets. The cement will hold better if the parts to be joined be roughened by a pointed tool before cementing, which can be done without destroying the edge of the fractured part.—*Monthly Magazine.*

**HARDENING GLUE.**—The only thing that will render glue perfectly insoluble is bichromate of potash. If you add a little of this in solution to the glue and after applying the glue to the article expose it to the sunlight, it will become insoluble, even in hot water. Better expose for a good while, say an hour or so, to make sure that all the glue has become insoluble.

**PLATING SMALL ARTICLES.**—Covering small pieces of steel with brass: Plunge them in a solution of six grams of sulphate of copper and six grams of chloride of tin in a quart of water. To whiten silver articles boil them in a solution of 1 part of cream of tartar, 2 parts of salt, and 50 parts of water, until they assume a fine, unpolished white.

TO REPAIR a watch dial take a little pure spermaceti, melt it with white of silver, and carefully fill the injury of the dial; rub it smooth with a linen rag, and finish with silk paper. Spermaceti is better for the purpose than white wax.

ACCORDING to Mr. Fairthorn, benzine may be freed from all offensive odor by shaking it well up with quicklime, about three ounces to the gallon.

## GOOD HEALTH.

## How the Waste of the Body is Thrown Off.

At a recent meeting of the Griffith Club of Microscopy (Detroit), the fascination of microscopical study was well illustrated by the demonstration of Prof. H. Stowell, of Michigan University. Demonstration number one was upon epithelial cells, which he produced from the inside and roof of his mouth with a "poetical" movement of the tongue, and deposited upon a glass slide, to all appearance, a drop of saliva. Skimming the air bubbles from the top with a pin, and removing the surplus saliva with a piece of blotting paper, he added a drop of staining fluid to better define the cells, and placing it under a microscope exhibited a multitude of thin, transparent scales, each about one five-hundredth of an inch in diameter, and containing a nucleus in the center. This, he asserted, was the form in which a large part of all bodies wasted, being thrown off through perspiration constantly. Demonstration number two was of glandular epithelial cells, from the scrapings of the liver of an ox, much smaller, but similar in some respects to those previously shown. Demonstration number three was of cells from the mucous membrane of the roof of a frog's mouth, which exhibited the extraordinary action of the cilia. These cells were fringed with hair-like protuberances, styled cilia, that moved with great activity and regularly, and seemed endowed with separate organic life and intelligence. The Professor asserted that these cells were very common in the human body, noticeably in the bronchial tubes, where the cilia, moving always in one direction, were active in throwing off foreign substances injurious to health. Demonstration number four was of the circulation of blood in the feet of several frogs, rendered insensible by an injection of woorara.

**PROLONGATION OF LIFE.**—Some years ago the French ministry addressed a circular to all the prefects, desiring them to institute inquiries as to the conditions which appeared peculiarly to favor longevity in their several districts, and the replies are said to have almost unanimously indicated as the leading elements or influences great sobriety, regular labor and usually in the open air, daily exercise short of fatigue, early hours, a comparatively well-to-do life, calmness of mind in meeting troubles, moderate intellectual powers and a family life. The beneficial influence of marriage on the duration of life is universally admitted, and re-marriage does not seem to us unfavorable. The prefects also indicate heredity as a frequent cause, and the influence of climate is also admitted; this latter, however, is separable with difficulty from other causes which may be operating simultaneously; but if all things were otherwise equal, it would seem that southern are less favorable to longevity than northern climates.

## Rheumatism.

Common rheumatism is a disease which affects the joints, the hinges of the body, in such a way, that the slightest motion of the ailing part gives pain. A creaking hinge is dry, and turns bard. A single drop of oil to moisture it makes a wonderful change, and it instantly moves on itself with the utmost facility. All kinds of rheumatism are an inflammation of the surface of the joints. Inflammation is heat; this heat dries their surfaces; hence, the very slightest effort at motion gives piercing pains. In a healthy condition of the parts, nature is constantly throwing out a lubricating oil, which keeps the joints in a perfectly smooth and easy-working condition. Rheumatism is almost always caused—indeed, it may be nearer the truth to say, that it is always the result of a cold dampness. A dry cold, or a warm dampness, does not induce rheumatism. A garment, wetted by perspiration or rain, or water in any other form, about a joint, and allowed to dry while the person is in a state of rest, is the most common way of causing rheumatism. A partial wetting of a garment is more apt to induce an attack than if the clothing were wetted; because, in the latter case, it would be certainly and speedily exchanged for dry garments. There are two very certain methods of preventing rheumatism. The very moment a garment is wetted in whole or in part, change it, or keep in motion sufficient to maintain a very slight perspiration, until the clothing is perfectly dried.

The failure to wear woolen flannel next the skin, is the most frequent cause of rheumatism; for a common muslin or linen or silk shirt of a person in a perspiration, becomes damp and cold the instant a puff of air strikes it, even in mid-summer. This is not the case when woolen flannel is worn next the skin.

The easiest, most certain, and least hurtful way of curing this troublesome affection is, first, to keep the joint affected wound around with several folds of woolen flannel; second, live entirely on the lightest kind of food, such as coarse breads, ripe fruit, berries, boiled turnips, stewed apples, and the like. If such things were eaten to the extent of keeping the system freely open, and exercise was taken, so that a slight moisture should be on the surface of the skin all the time; or if, in bed, the same thing were accomplished by hot teas and plentiful bed-clothing, a grateful relief and an ultimate cure will very certainly result in a reasonably short time. Without this soft and moist and warm condition of the skin, and an open state of the system, the disease will continue to torture for weeks and months and years.

Inflammatory rheumatism may, for all practical purposes, be regarded as an aggravated form of the common kind, extending to all the joints of the body, instead of implicating only one or two. For all kinds, time, flannel, warmth, with a light and cooling diet, are the great remedies.—*Hall's Journal of Health.*

**THE DANGERS OF SEA BATHING.**—The death of Lord Justice Thesiger, writes Olive Logan to the *Philadelphia Times*, was the result of a singular cause. When the deceased legal light was a baby two years old, he had scarlet fever which was followed by inflammation of the left ear. He was deaf in the affected ear more or less all his life, and three or four years ago he consulted Mr. Dalby, the great aurist, one of the few men on earth who really know anything about the diseases of that most complex and delicate organ, the ear. Mr. Dalby found perforation of the tympanic membrane—that most frequent of all causes of deafness—and advised artificial protection. A few weeks ago the deceased gentleman was bathing in a rather rough sea, when he was knocked on the left ear by a heavy wave. Intense pain soon followed, coupled with stiffness of the neck, which indicated that inflammation had extended along the internal passages. The best medical and surgical talent was summoned, but nothing could save him. It should be mentioned that at the time the wave struck the Lord Justice his ear was not protected, and I record this case in the hope of warning readers against the danger of going into the sea without protecting the ears with small wads of cotton. At the French watering places the attendants are always provided with cotton hating, which they offer to bathers. On exceptionally cold days, too, it is well to protect the ears from bitter winds with cotton. Ear-ache and deafness are the frequent results of a lack of care in this matter, but this is the first time I ever heard of death being directly traceable to a perforated tympanum.

**OATMEAL AS FOOD.**—Oatmeal, as is well known, is a food of great strength and nutrition, having claims to be better known and more widely used than it is at present. Of much service as a brain food, it contains phosphorus enough to keep a man doing an ordinary amount of brain work in health and vigor. All medical authorities unite in the opinion that eaten with milk it is a perfect food, having all requisites for the development of the system.

**SWALLOWED A LIVE BEE.**—One day last week Augustus Springham, of Freeburg, Snyder county, Pa., drank a cup of cider, and immediately after drinking he felt a severe pain in his throat, which rapidly increased, and his throat soon became so swollen that he was scarcely able to swallow. He now feels confident that he drank a bee, which stung him.

#### The Week.

The week has been a stormy one. News of flood comes from all quarters; and as we write (Thursday evening) there is a steady downpour of rain. A good many of the farmers will lose by this storm, and some of the miners, too; the latter being liable to have lots of work on ditches, etc., when this is over. The heavy rains, however, are clearing out the ravines, canyons and gulches, carrying the tailings further down out of the way. The ground will be well soaked, too, which will benefit the hydraulic miners. The abundance of water everywhere has made the miners rejoice, although those with quartz mines unable to take much surface water may grumble a little.

The storm has interrupted travel a good deal, and the gathering of news has not been an easy matter, apparently, for the California interior papers are short of their usual local mining items.

We give elsewhere in this number an abstract of legislative proceedings, and also an account of the results of the storm. Our readers will find a good deal of other matters to interest them in the PRESS. We aim to continually improve and to obtain all the information of value to our special readers that is possible. Our mining field is widening gradually but surely, but we keep track of all improvements in the mining and metallurgical line that is of value.

**COPPER ORES.**—The present quotations for copper ores in this city are as follows: For 20% ore, \$1.60 per unit; for 30% ore, \$1.85; for 40%, \$2.; for 50%, \$2.10; and for 60%, \$2.25. Copper miners understand, of course, that this is for a ton of 2,352 pounds.

**SUTRO Tunnel** company stock is now worth \$1 per share.

#### Surplus Population in Mining Camps.

Every actual producer in the world seems to be compelled to support by his labor two or three non-producers. The only wonder is that they continue to be willing to do so. This is nowhere better illustrated than in mining camps, and especially in new and prosperous ones. As the camp starts in when hard work is the rule and contingencies have to be considered, there are comparatively few non-producers. As it grows, becomes prosperous, mines are opened, reduction works put up, and the town enlarges, there will be then four or five times as many people living in the town as there are miners, who are the real producers. Then a decadence sets in, times come down to a bed-rock basis, the superfluous population begins to drain off gradually, until by and by the few miners only are left. It will generally be found too that the people who have gone have all the money while the miners, who earned—and spent it—are without any. We were reading this other day the statement of a correspondent in Tombstone, Arizona, in which he said there were from 1,000 to 1,200 structures fringing the streets of that camp, and that the inhabitants number at least 3,000. At the same time he said the place only gives employment steadily to some 400 miners. This is only a case in point.

In California, mining districts, with the exception of Bodis, perhaps, this surplus population has been cut off, and has taken to other pursuits. Of Nevada, the same may be said. One will find in this State and Nevada, that working miners, with their families, form the principal population of the mining towns. There is not the idle adult male population, which formerly existed. The fact that mining matters in these two States are on a more substantial and steady basis, may account for this. We have now passed our periods of excitement. We have no "rushes," no sudden opening of new regions to which flock all the idle people of the country. Our camps are like manufacturing towns. Certain mines are worked and certain "hands" are employed. People who work are acceptable, and those who come to live off the workers, or to idle away their time, are not wanted. The time has gone by when the presence of a crowd in a town indicated prosperity. We have learned better now. It is more apt to show signs of a feverish, unhealthy excitement. But as a strictly business proposition a "crowd" is no use.

In traveling through Nevada, as in this State, the older camps show no signs of surplus population. Everywhere are seen working miners who contribute their share to the aggregate bullion product, but without any noise or fuss. We believe one reason why California has kept up her bullion product so as still to be second on the list of bullion producers, and this year show an increase of over half a million, is that so many small groups of miners are at work all over the State. We have had no advent of capital, no advertising of our resources, no special notice taken of our mines, yet we produced last year \$17,000,000 of gold. Surplus population of mining camps is passing south. It is going to Arizona and New Mexico, and those territories will have to get rid of a good deal of it before a solid, regular and business-like development of their resources will be possible. The sooner the non-producers are set at some honest labor the better it will be for the country.

**BAD GROUND.**—The ground in the south header of the Sutro Tunnel swells so badly and so crushes the timbers that it has been found necessary to stop work at the face and put the men to work at easing up the timbers. It will be necessary to overhaul about 150 ft. of the header. Of this 100 ft. is very bad ground, and 50 ft. that would eventually give trouble. It will be necessary to dig out about four ft. over the roof timbers, and from three to four ft. behind those on the sides, and put in false sets of double timbers. Toward the face of the header timbers 14 inches square are bent and splintered until they almost meet in the middle of the drift. The ground is a mixture of clay and boulders of andesite rock.

**WILLIAM C. BENNETT** has filed a complaint in equity against the St. Lawrence Mining Co. and its trustees, praying that the Court enjoin and restrain the company from selling or transferring certain certificates of stock claimed by him. The complaint sets forth that on the 24th of January plaintiff was the owner and holder of 37,121 shares of the capital stock of the company, which were subsequently transferred by L. L. Robinson as President of the company and Clinton Gurnee as Secretary, to several parties without any consideration. Plaintiff, besides claiming the said number of shares of the company's stock, also claims damages in the sum of \$5,000.

The strong suit of any paper published in a country town is in its local department, but a good many of them pay more attention to general politics and general topics than to local affairs. A pattern paper in this respect is the old *Mountain Messenger*, Downieville, Sierra county. We always find it well supplied with local items, and can keep track, through it, of the developments of the mines of the county. We wish some of our other interior exchanges would follow the suit of the *Messenger*.

#### Prospect Holes and Mines.

We have heard lately a good deal of what seems a well-founded complaint about some of the Arizona camps, viz: That mine owners and locators prefer letting the mineral lie upon the dumps for the inspection of strangers and intending purchasers, rather than to let "chloriders" and "tributers" work the claims, or to work them themselves.

This sort of thing may do for a little time, perhaps, but it will not last long. There are not very many men trotting around the country with hags of twenties or rolls of greenbacks looking for little holes in the ground with a swelling around the top. They would much rather, as a general thing, find a deeper hole and less dump, as indicating that the miner was not afraid to go down on his claim, and that the ore he took out paid him to work. Small holes and comparatively big dumps may do well enough for greenies, but few mining men care to invest much coin in that direction.

If the ore is rich and will pay wages to work, why not, when there are facilities, work it up? What is the use of letting a number of tons of good ore lie on the dumps simply to impress strangers; and especially when it *don't* impress strangers who know anything of mining.

Where there are no means of having ore reduced there is of course some excuse; otherwise, there is none. With good ore in a mine, nowadays, "chloriders" can always be found who will take it out on shares. Of course they have to be overlooked so they will not injure the workings. But the claims should be worked in some way, anyhow, and not left idle.

It is the bane of all camps, however, to have a lot of prospect holes owned by a few shiftless sort of men calling themselves miners, but who are only on the sell and not on the work. They work enough to open a hole and show up a lead a little so as to get a few tons of ore on the dumps. Then, imagining this lead to run to China, on the same basis as the first 20 ft., they sit down and wait for some one who is willing to discount the future for them. We have no patience with this class of prospectors. In Arizona, where rich surface ores abound, miners working for themselves ought to do well. But if they are content to sit down beside a few tons of quartz and await for coins double eagles to be poured into their pockets, it is their own fault if they have in the end to pawn their tools for a "grub stake."

#### Tombstone.

All the correspondents who write from Tombstone agree upon one proposition—that business in every department is overdone. The name of the camp is appropriate if indicative of the fate or the hopes of many who pinned their faith on making fortunes there as they were made in California in early days. People are flocking there by tens and hundreds every day, most of them with money enough to bring them, and who once there are left to their own resources. The town is growing rapidly, but is said to be almost one year ahead of the mines. The mines themselves are very easily worked and do not require half the number of men, mines of the same development would in Nevada. As far as the prospects for miners are concerned, we can do no better than quote an extract from a letter of a very plain speaking and sensible correspondent (J. D. P.), of the *Eureka Sentinel*, a man whom we know to be well posted on mining matters. He says:

"In population and business, Tombstone is as top-heavy as Uncle Sam's army, with its numerous Generals. This at first glance is evident to the observant stranger who comes to spy out the country and rate the business prospects and the social aspects of the place. There are probably 1,000 or 1,200 structures of all grades fringing the streets here, while the inhabitants must number at least 3,000 to keep within proper approximate bounds. Now this is a large population for a place not affording steady employment to more than 400 miners. In consequence there are many idle, who, had they remained in their former localities might have employed their physical capital to greater advantage than they have here. Eureka's two great properties employ as many if not more than are employed here altogether, notwithstanding the fact that there are eight or nine hoisting works visible from the streets, and that there are 10 or 12 incorporated properties in process of operation and partial development. From the foregoing data the stalwart sons of toil, for whose benefit I here present them, can each for himself understand how much better it is for him to remain where he is and be contented with his lot, if employed, than to come here in search of what he left behind him and cannot very readily obtain here. For these reasons I would not encourage miners of any grade to come here to look for work by the day exclusively, and the same applies with equal force to other orders of labor, such as clerks, bookkeepers, shopmen, lawyers, doctors and Micawbers generally, for here there are already enough and to spare. But if men have some means and prefer to turn prospectors, and range amid the hills and mountains in search of their hidden treasures, I say to all such that there is room enough for all who come of this class, and they may be expected to find greater and more certain reward for their labor than they could in, perhaps, any other such country on the globe."

#### Water on the Comstock.

The Belcher mine for the past year has had a great deal of trouble with water like many other Comstock mines. At the annual meeting of the company in this city the other day, the Superintendent in speaking of this subject said that the vertical portion of the pump-rod had broken twelve different times up to Sept. 1st, causing a stoppage for repairs of at least 36 hours each time. It was then deemed advisable to remove the old rod and replace it with a new one. This was done, and a new rod 14x16 was put in from the surface down to 70 ft. below the 900 station. This rod is made of the best Oregon pine, strapped with 10-inch plates all the way. The foundation for this V-bob was taken out and rebuilt. The V-bob itself was taken to the surface for repairs, receiving new keys, eyes, brasses, etc., and put down again. All the balance holes were thoroughly overhauled and repaired, making everything connected with the pumps as substantial as wood and iron could do it. Two new donkey pumps were put in at the 3000 station, and for the use of these pumps they laid 312 ft. of 4-inch column pipe from the 2760 level down to the 3000 level. They cut out a water drain and put down boxes on the 2760 level from the north incline through to the Yellow Jacket new shaft, a distance of 1200 feet. The incline track was repaired for a distance of 500 ft., and 513 ft. of water boxes were put in from the 1600 to the 1900 stations. The breaking of a portion of the pumping machinery of the Yellow Jacket new shaft caused the Belcher to fit up two pumps at the 2760 level and put down 342 ft. of 4-inch column pipe for the use of these pumps from the 2560 to the 2760 station, thinking at that time that they could hold the water at the latter level; they had also put in 400 ft. of 2-inch air pipe on this level, to convey compressed air from the Crown Point, when the Belcher failed to furnish a sufficient quantity to run all the pumps.

Notwithstanding all this work, when the accident happened to the Yellow Jacket pumping machinery—which caused that company's pump to shut down—and finding it to be impossible for the pumps to take care of all the water coming into the Belcher from the Yellow Jacket, Imperial, Alpha, etc., together with the strong body of water in the Belcher itself, it was deemed more economical to allow the water to rise in the mine than to continue fruitless attempts to keep it down, until such time as the Yellow Jacket pump would again start up. They therefore removed all donkey-pumps, engines, blowers, air-pipe, etc., from the bottom of the mine all the way up to the 2160 level.

On Saturday night last this pump on the 2160 level gave out, the working parts having been eaten by the acid in the water. Donkey-pumps were rigged and kept at work and the pump reached, but the water rose so rapidly that the workmen were driven out. Then the Jacket was appealed to and started its tanks hailing at the rate of over 1,500 tons of water per day. Then one of the donkeys broke a valve and it had to be drilled out, causing a delay of five hours; this being fixed a second valve broke, causing another equal delay. The main pump was at last reached, but the water had, meantime, reached 15 ft. along the 2160 level.

The talk now is to the effect that Belcher will connect with the Sutro tunnel through the Jacket drift by tubing from the 1400 level. Should that be done, a double line of pumps would be worked from the bottom up to that level and would be able to handle all the water of the lower levels. The cost would be about \$15,000, of which Crown Point would pay, say \$5,000. The Belcher would save the other \$10,000 in two months in wood alone. The *Gold Hill News* says that this arrangement would allow Overman and Caledonia to come in, too, with their connections. Then, running 3,000 ft. east, connection could be made on the 2295 level of the Overman with the Forman shaft when it reached that depth, and water easily raised from that level and sent through the same connection. The present east drift in Overman on the 2275 level is aimed exactly at the perpendicular of the Forman shaft and could be easily driven over. The whole plan or proposition looks feasible and economical, till such time as the south header of the tunnel makes the Forman shaft.

The Boston Stock Exchange, with its limited number of members, is creating an increasing value for its membership privileges. A seat recently sold for \$7,000. In the New York board seats command \$30,000, and it is said will soon go to \$50,000.

The Lake Superior mining region produced about 25,000 tons of ingot copper in 1880. The great districts of the upper Michigan peninsula yielded \$18,000,000 worth of copper and iron ore during the past year.

It is estimated that the total amount of gold yielded by Cassiar district last year is about \$250,000. Upward of 150 miners will winter in the mines principally on McDame creek, which is now almost entirely occupied by Chinamen.

COLONEL L. W. WOOD, at one time quite a prominent man in mining circles here and in Nevada, and after whom the Woodville mine was named, died of smallpox in this city this week.

## Legislative.

The members of the Legislature visited the now famous hrush dam last week, but came back not much wiser than they went as far as can be seen. The dam was way under water, of course, and notwithstanding the heavy storm and resultant floods since, the dam has evidently stood, as no reports to the contrary have appeared.

The debris question is making a great deal of discussion in the Legislature, but up to present writing (Thursday evening) no vote on the repeal of the debris act has been taken. A number of bills have, however, been introduced intended to remedy the evil. In addition to what we have already published, the following have been introduced:

Cunningham has offered one to promote drainage, and protect farming lands against debris, seaweed and other refuse.

Harlan has offered three bills as follows: To prevent the filling up of the streams, rivers and bays of the State with the tailings and debris from hydraulic mines. Also, relative to parties in actions to recover damages from injuries from flows or tailings. Also, in relation to the parties and place of trial in actions for injuries arising from tailings and debris from the mines.

These three bills directed against the running of debris and tailings on the lands of others, provide a criminal and civil remedy against such acts. The civil remedy provides for damages, and allows of an injunction being sued out. The plaintiff may unite as defendants all persons or corporations who have contributed to such injury, and the action shall be tried in the county where the injury is sustained.

Senator Johnson, of Sacramento, introduced the following concurrent resolutions:

WHEREAS, Hydraulic mining has caused the principal waterway of the State to be choked with sand, has made useless much hitherto productive soil, is threatening the total destruction of internal navigation, and is fast rendering unprofitable the cultivation of the best lands in the great valleys, therefore be it

Resolved, By the Senate, the Assembly concurring, that our Senators in Congress be instructed and our Representatives requested to use their best endeavors to have the law providing for the sale of mineral lands so amended that these lands shall not henceforth be sold, but on the condition that they shall never be worked by what is known as the hydraulic process of mining.

Resolved, That his Excellency, the Governor, he, and is hereby requested to transmit a copy of this by telegraph to the California delegation in Congress.

Senator Johnson has introduced another bill relative to drainage and irrigation, which presents in a new form those questions. The bill is preceded by a preamble, as follows:

"WHEREAS, from physical and climatic causes, the material interests of the State are so widely extended and diversified in character that no general law in relation to the ownership, use and distribution of water for irrigable purposes can be made applicable to the whole State. Such a law, calculated to foster and protect the interests of one section might be injurious to another of equal magnitude and importance. Now, therefore, that each and all sections may have the benefit of just and equitable laws applicable to their climatic and physical condition," it is enacted, etc.

Senator Johnson then provides that the State shall be divided into two districts, to be known as the "Drainage District," and the "Irrigable District." The Drainage District shall be composed of the counties of Del Norte, Siskiyou, Modoc, Humboldt, Trinity, Shasta, Lassen, Tehama, Plumas, Butte, Sierra, Mendocino, Colusa, Sutter, Yuba, Nevada, Placer, Lake, Sonoma, Napa, Yolo, El Dorado, Marin, Solano, Sacramento, Amador, Calaveras, Alpine, Contra Costa, San Joaquin, Tuolumne, Mono, Mariposa, Stanislaus, Alameda, Santa Cruz, Santa Clara, San Francisco and San Mateo. It is then provided that the Irrigable District shall be composed of the other counties of the State, which are named. The intent of the law is obvious, as it separates by law two localities which require division in the way proposed.

Among other measures proposed, which are of interest to our special readers, are the following:

Hill's bill so prohibit the purchase or sale of mining stocks on margin provides as follows: "Whoever contracts to have or give to himself or another the option to sell or buy at a future time any grain or other commodity, stock of any mining or other incorporated company, or forestall the market by spreading false rumors to influence the price of such commodities, or corner the market, or attempts to do so, in relation to any such stock or commodities, is guilty of a misdemeanor, and all contracts made in violation of this section shall be null and void."

Senate bill, No. 81, by Mr. Brown, relates to laws of mining districts and organization of districts. The bill provides for a new title to Part II. of the Civil Code, with sections numbering from 873 to 895 inclusive. It also provides that the supervisors divide the county into mining districts, and call meetings in the districts to enact mining laws. All citizens who have been 30 days resident in a district prior to a meeting, and who own or work a claim in the district, may vote and take part at the meeting. One of the supervisors must preside, and with two vice-

presidents pass upon the qualifications of any person to vote. The meeting may make a code of laws, but the code for quartz mining must be separate from that of placer mining. Meetings may be called at any time by the board of supervisors to amend the laws.

Assemblyman May's bill amends Section 5 of act of April 16, 1880, by making the money raised by tax on mining and milling of ores by act of April 1, 1878, payable to the State Treasurer (less expenses of collection), who shall keep the money in the Mining Bureau fund, to be drawn upon by warrants for the expenses of the Mining Bureau. The words in brackets indicate the amendment.

The Committee on Mines and Mining Interests reported back S. C. R. 10, relative to the transfer of the mineralogical cabinet to the Mining Bureau, recommending that it do pass. This refers to the collection of minerals at the State Library, Sacramento.

Assembly bill No. 168 is intended to transfer the cabinet of minerals, and all the surveying and other instruments and material belonging to the State Geological Survey now stored at the University of California, to the State Mineralogist. Mr. Hoitt has presented a petition from the Board of Regents of the University, opposing the transfer of the collection on the ground that it is used for instructing the students in the college of mines. The surveying

DAUGHERTY'S IMPROVED BOOK REST.

instruments are used by the class in surveying. The State might easily afford a new set of these to the State Mineralogist instead of having him use the old ones.

Assembly bill No. 195, to amend an act amendatory of an act entitled "An act for the better protection of the stockholders in corpora-

COMPRESSION OF CHINESE LADIES' FEET.

tions formed under the laws of the State of California, for the purpose of carrying on and conducting the business of mining," approved March 30, 1874, approved April 23, 1880, was refused a reading.

Assembly bill No. 238, by Mr. Pindar, is to the effect that all contracts for the sale of shares of the capital stock of any corporation or association on margin, or to be delivered at a future date, shall be void; and any money paid on such contracts may be recovered by the party paying it, by suit, in any court of competent jurisdiction.

Senator Hill has introduced a good bill. It requires all buildings in process of erection or hereafter to the built, which may or shall be used for churches, school-houses, operas, theaters, lecture-rooms, hotels, public meetings, town halls, or which shall be used for any purpose whereby a collection of people may be assembled together for religious worship, amusement and instruction, shall be so built that all doors leading from the main halls shall be so awning as to open outward. All means of egress from the buildings must be by doors opening outward. In all incorporated cities and towns, the Mayor or other corporate authority is authorized to close and prohibit all public buildings hereafter erected from being used, in violation of this act,

## A New Book Holder.

From among the many convenient articles of general utility produced recently by Pacific coast inventors we select one that meets a requirement which has heretofore been unsupplied, and is in a comparatively new field for the exercise of inventive genius.

Mr. Wm. B. Daugherty, of Carson City, Nev., has patented through the MINING AND SCIENTIFIC PRESS Patent Agency, a novel device for holding an open book, the device being hung from the shoulders of the reader in such a manner as to have the book in proper place for reading, allowing the reader to assume any position he may desire, and leaving his arms and hands free.

It consists of a base upon which the book rests, and from the sides of this base are two curved arms which are so formed as to hook over the shoulders of the reader and are properly braced to hold the base in the same relative position, whether the reader is in a sitting, standing or reclining position; it also consists of holding devices for the book and other details of construction, all of which are hereinafter more fully described.

Let A represent the base upon which the

book rests. This base may be constructed of any light material, and is oblong in shape, having one end curved or concaved, as shown, for the purpose of better fitting the person of the reader. Extending from the concaved inner end of the base, A, are curved arms, B, B, which are so formed as to hook over the reader's

shoulders and hold the base in place; braces, c, c, reach midway from the arms, B, B, to the base, A, and serve to stiffen the parts. These braces are formed with the arms by bending a single arm for each of the arms so that the hooked portion is doubled while the parts separate at the arm brace as shown. The arms, B, B, are held together by a cross piece, d, which prevents their spreading and slipping from the shoulders. Across the base, A, at a point between the braces, c, c, is placed a wire, D, which stands a short distance above the base, and has projections, E, formed by bending it near the ends, as shown, so that the lower end of an open book may be placed beneath, and the leaves held down. Another projecting portion, G, at the center, extends down to the base and acts as a stop to prevent the book from sliding down beneath the cross bar. The other end of the book is held in place by means of a clamp, H.

This clamp, H, consists of a wire rod which is fitted to slide along beneath the base, A. This rod is bent up at right angles, passing through a slot near the top of the part, A, and extending to a sufficient height to hold an ordinary book, being so formed at its upper end as to press down upon the opposite pages of an open book. This clamp is adjustable so that when a book is to be removed the clamp is pushed up away from the book, allowing it to

become free. It is also curved slightly backward at the point, where it is bent to pass up through the slot so that it will have an elastic pressure upon the book leaves. When it is desired to place a book in this holder the book is opened, and the lower end placed under the curved holding wire, D, and the clamp, E, brought into proper position to hold the upper end of the book. The curved ends of the arms, B, B, are then hooked over the shoulders, and the book is then firmly held in position. This device is very convenient, as the reader may have his hands free for writing or other occupation, and may read in any position desired.

## Chinese Women's Feet.

An American missionary, Miss Norwood, of Swatow, some time since described in a New York Times paragraph how the size of the feet is reduced in Chinese women. The binding of the feet is not begun until the child has learned to walk. The handages are especially manufactured, and are about two inches wide and two yards long for the first year, five yards long for subsequent years. The end of the strip is laid on the inside of the foot at the instep, then carried over the toes, under the foot, and around the heel, the toes being thus drawn toward and over the sole, while a bulge is produced on the instep, and a deep indentation in the sole. Successive layers of bandages are used till the strip is all used, and the end is then sewn tightly down. The foot is so squeezed upward that, in walking, only the ball of the great toe touches the ground. After a month the foot is put in hot water to soak some time; then the handage is carefully unwound, much dead cuticle coming off with it. Frequently, too, one or two toes may even drop off, in which case the woman feels afterward repaid by having smaller and more delicate feet. Each time the handage is taken off, the foot is kneaded to make the joints more flexible, and is then bound up again as quickly as possible with a fresh handage, which is drawn up more tightly. During the first year the pain is so intense that the sufferer can do nothing, and for about two years the foot aches continually, and is the seat of a pain which is like the pricking of sharp needles. With continued rigorous binding the foot in two years becomes dead and ceases to ache, and the whole leg, from the knee downward, becomes shrunk, so as to be little more than skin and bone. When once formed, the "golden lily," as the Chinese lady calls her delicate little foot, can never recover its original shape.

Our illustrations show the foot well bandaged and unbandaged, and are from photographs forwarded by J. W. Bennington, R. N., to the Scientific American, and who writes: "It is an error to suppose, as many do, that it is only the upper ten among the daughters of China that indulge in the luxury of 'golden lilies,' as it is extremely common among every class, even to the poorest—notably the poor sewing women one sees in every Chinese city and town, who can barely manage to hobble from house to house seeking work. The pain endured while under the operation is so severe and continuous that the poor girls never sleep for long periods without the aid of strong narcotics, and then only but fitfully; and it is from this constant suffering that the peculiar sullen or stolid look so often seen on the woman's face is derived. The origin of this custom is involved in mystery to the Westerners. Some say that the strong-minded among the ladies wanted to interfere in politics, and that there is a general liking for visiting, chattering and gossip (and Chinese women can chatter and gossip), both and all of which inclinations their lords desired, and desire, to stop by crippling them."

Of late there has been considerable activity among the China miners at the Lava Beds, near Oroville, Butte Co., for some reason or other. The Record says old claims that had been abandoned are being relocated, and gangs of men put to work. On a tract formerly owned by J. C. Gray, a gang has been at work during the last month, and have been taking out all the way from 75 cents to \$2 to the rocker.

For carpenters and builders there is nothing to do on the Comstock. Men who formerly worked gangs of from 40 to 60 men are now glad to get a job for themselves at putting in a patch of sidewalk, putting down a crossing or repairing a broken fence.

The new iron bridge over the creek at Oakland to be built by the narrow-gauge road, will be 212 ft. long, the diameter of the turn-table 32 ft. 8 inches, the entire length of the bridge being 1,030 ft. It will cost \$25,000.

RUSSELL KING, formerly of Stockton and several years a compositor and foreman in this office, died recently at Hanford, in his 28th year. He is well remembered for his genial and kindly disposition and his many good qualities.

A NUMBER of the miners who came down from Alta, Utah, after the terrible snow-slides, have concluded to direct their attention to other camps where danger is not so thick and fast.

THE Spring Valley Gold Co., Butte Co., received two electric light engines from New York, last week. The express charges on them were over \$300.

## Population, 50,152,559.

The Census Bureau has figured so far upon the returns of population as to reach the conclusion that the total, exclusive of Alaska and that region west of Arkansas known as the Indian Territory, is 50,152,559. But while these figures are official they are not final, and may be changed hereafter in the revisory calculations, though it is not likely that such possible changes will go above the units, tens or hundreds columns. For all practical purposes the total population of the United States and Territories, exclusive of Alaska and the Indian Territory, may be stated at 50,152,000. The increase since 1870 has been 11,266,024, or nearly 9%. The present population of the Pacific States and Territories, namely, California, Oregon, Nevada, Washington, Idaho, Arizona and Utah, is officially stated as follows:

California.....	864,636
Oregon.....	174,767
Nevada.....	62,265
Washington.....	75,120
Idaho.....	32,611
Arizona.....	40,441
Utah.....	143,907

Total.....1,393,797

The increase of this division of the country since 1870 has been 451,866, or 43%. The increase in Nevada was but 6%, which is the lowest, while in Washington Territory it was 100%, which is the highest rate. The per cent. of increase in the Pacific division is greater than in any other. In the Eastern division, including New York, New England, New Jersey and Pennsylvania, the per cent is but 18. In the Western division, including Missouri and the Territories of Dakota, Wyoming and Montana, 34%. In the southern division, excluding Missouri and including all the other old slave States, 34%. In the district of Columbia, 35%. It is now conceded that the apparent large increase in the Southern States is due to the fact that this census was taken there with more regard to exactness than any preceding one, while that of 1870 was done in a slovenly and careless manner, not reaching a large mass of the population. There is but one city in the United States or on the American continent that contains over 1,000,000 population—New York. There are three others that contain over half a million; three others above 300,000; three others above 200,000, including San Francisco, and ten others above 100,000. The following is a carefully revised list of the cities that overgo 30,000 inhabitants each, California having two of them. It will be a good thing to keep for future reference:

New York.....	1,306,590	Columbus, O.....	51,605
Philadelphia.....	846,934	Paterson.....	50,837
Brooklyn.....	596,689	Toledo.....	50,143
Chicago.....	503,304	Charleston.....	49,409
Boston.....	362,535	Fall River.....	49,000
St. Louis.....	350,522	Minneapolis.....	46,387
Baltimore.....	332,190	Scranton.....	45,850
Cincinnati.....	255,708	Nashville.....	45,461
San Francisco.....	233,956	Reading.....	45,280
New Orleans.....	216,140	Hartford.....	45,253
Cleveland.....	160,142	Wilmington.....	42,499
Pittsburg.....	154,831	Camden.....	41,683
Buffalo.....	155,137	St. Paul.....	41,408
Washington.....	147,307	Lawrence, Mass.....	39,178
Newark.....	136,400	Dayton.....	35,677
Louisville.....	123,645	Lynn.....	38,284
Jersey City.....	120,728	Denver.....	35,630
Detroit.....	116,342	Oakland, Cal.....	34,556
Milwaukee.....	115,578	Atlanta.....	34,398
Providence.....	104,850	Worcester.....	33,913
Albany.....	90,903	Portland, Me.....	33,810
Rochester.....	89,363	Memphis.....	33,593
Allentown, Pa.....	78,681	Springfield, Mass.....	33,340
Indianapolis.....	75,074	Manchester, N. H.....	32,630
Richmond.....	63,803	St. Joseph, Mo.....	32,484
New Haven.....	62,882	Grand Rapids.....	32,015
Lowell.....	59,485	Wheeling.....	31,266
Worcester.....	58,205	Mobile, Ala.....	31,205
Troy.....	56,747	Hoboken.....	30,999
Kansas City.....	55,813	Harrisburg.....	30,762
Cambridge, Mass.....	52,746	Savannah.....	30,681
Syracuse.....	51,791	Omaha.....	30,513

The great trunk lines have recently decided to place the air-brakes on their freight cars, its use upon passenger cars fully demonstrating its economical qualities.

## MOREY &amp; SPERRY,

MANUFACTURERS OF

## Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills' Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supp. Iron Work complete for Wood Frames, also

SPERRY'S  
WROUGHT IRON FRAME  
FOR STAMP MILLS.

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

PACIFIC MACHINERY DEPOT.

H. P. GREGORY & CO.,

Nos. 2 and 4 California Street, San Francisco.

Importers and Dealers in every description of

MACHINERY!

Sole Agents for the Pacific Coast for

BUCKEYE  
Engine Company.

J. A. Fay & Co.'s Wood-Working Machinery; Beament & Sons' Machinists' Tools; Blake Steam Pumps; N. Y. Belting and Packing Co.'s Rubber Goods; Sturtevant Blowers and Exhaust Fan; Tanite Co.'s Emery Wheels and Machinery; Payne's Vertical Engines and Boilers; Perry's Centrifugal Pump; Judson's Standard Governors; Dreyfus Self-Oilers; Gould Mfg. Co.'s Hand and Power Pumps; Eclipse Windmills; Dieston & Sons Circular Saws; Otto Silent Gas Engine; Dues' Elevator Cups; Ballard's Oak Tanned Belting.

Also on hand and for sale A FULL LINE OF MILL AND MINING SUPPLIES.

## NOTICE!

ENGINEERS, DEALERS AND USERS OF STEAM PUMPS

Will Please take notice that we have taken the sole agency for the KNOWLES' STEAM PUMP, for the Pacific Coast States and Territories, and keep a full stock of Pumps and Duplicate Parts on hand at all times.

PARKE & LACY,

Nos. 21 and 23 FREMONT STREET.

San Francisco, Cal., September 23, 1880.

## LEFFEL'S IMPROVED WATER WHEEL.

PRICES REDUCED!

PATENTS REISSUED 1868.

The "OLD RELIABLE" with improvements, making it

THE MOST PERFECT TURBINE NOW IN USE.

Comprising the Largest and the Smallest Wheels, under both the Highest and Lowest head used in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for New Prices, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

JAMES LEFFEL & CO., Springfield, Ohio,  
and 110 Liberty St., N. Y. City.

PARKE & LACY, Sole Agents, 21 and 23 Fremont St., S. F.

SAVE YOUR  
GOLD AND SILVER.

I am prepared to demonstrate, if miners will bring me from 500 pounds to a ton of their ores, that I can save from 25 to 100 per cent. more than any other machinery now in use. I will make no charge.

Machinery can be seen in operation every day at No. 143 Fremont Street.

M. B. DODGE.

## BOILER COVERINGS.

Plastic Cement and Hair Felt, with or without the Patent "AIR SPACE" Method. Cement ready for use by the barrel.

G. C. FOWLER, No. 413 Pacific St., S. F.

J. H. WYTHE, M. D.

Residence: 965 West Street, Oakland. Office: 750 Market St., San Francisco.

## A Card from Architects.

## The California Architect and Building Review.

Office, No. 210 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:

Believing that a journal of this kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, E. Huene, John Marquis, B. McDougal & Son, Wm. Mosser, Wm. Curlett, Meeker & Banks, W. O. Hoagland, S. & J. Newsom, B. Henrickson

## New Book on the Comstock.

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. PH. D., on "The Comstock Lode, Its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. E. M. SLEAZER will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

## THE IMPROVED INGERSOLL

## Rock Drill and Air Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Comstock.

GEO. R. FOARD, GEN'L AGENT,  
No. 18, First St., S. F.

## CAUTION.

To the Public Generally.  
Notice is hereby given that George R. Foard, of No. 18 First Street, San Francisco, is the sole authorized agent for the sale of our manufacture, consisting of Rock Drills, Air Compressors, and duplicate parts of either in the territory known as the Pacific Slope, and that no other person or persons have any right or authority to represent themselves as the agents of this Company within the above mentioned territory.

Also, take notice, that all persons manufacturing, or using any Rock Drills, Air Compressors, or duplicate parts of either, manufactured by others, embracing in their construction the mechanical inventions and appliances covered by the Patents owned by this Company, will be prosecuted for such infringement.

INGERSOLL ROCK DRILL CO.

New York, November 30, 1880.

Scientific and Practical Books  
on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ore and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3.00 coin, postage free.

## FOR SALE

By Private Treaty as a Going Concern.

The NEW BATTLE MOUNTAIN COPPER MINES, with Steam Engine and Boiler, Pumping and Hoisting Machinery, with Boarding House, Office and Dwelling Houses, and a large Concentrating Mill and Ranges at Copper Creek, two miles from the mine, where there is a full supply of water for milling purposes. These mines have been in active operation for the past 12 years and have yielded large quantities of high percentage Copper ore. The mines at present are in regular course of working, and monthly shipments of high percentage ore are being made. The average assay of the ore for the past 18 months, has been 42% of Metallic Copper.

The Virgin Mine is sunk to the 600-ft. Level and is supplied with ample Pumping and Hoisting Machinery.

The Lake Superior Mine is sunk to the 135-ft. Level.

There is a large quantity of ore in the dumps at surface that can be profitably treated by Milling and Concentrating. The above mines are situated at Copper Canyon, 15 miles from Battle Mountain station, on the C. P. R. R., and 9 miles from the Nevada Central R. R., and are approached by excellent roads.

Further information respecting the property may be obtained of Messrs. HELLMANN BROS. & CO., Front St., San Francisco.

To inspect the property, and for full information thereon, application must be made to SAM'L G. TRUBAN, the Superintendent of the mines, who will be open to receive offers for the same, until Monday, the 14th day of February, 1881.

The above property offers a rare opportunity for parties desirous of investing in copper mines.

The Directors do not bind themselves to accept the highest or any offer.

NEW BATTLE MOUNTAIN MINES,  
Galena P. O., Battle Mountain, Lander County, Nevada.

SAM'L G. TRUBAN, Superintendent,  
January 11th, 1881.

STRONG & CO., 10 Stevenson Street, S. F.

ORES SAMPLED, TESTED, ASSAYED.

**Books for Miners and Millmen.**

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arsenurets, and gold and silver ores generally, with lithographic diagrams. 1877. This work is unequalled by any other published embracing the subjects treated. Post-paid, \$7.50. Printed and sold by Dewey & Co., S. F.

AARON'S TESTING AND WORKING SILVER ORES.—Illustrated, 114 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, \$2. Published and sold by Dewey & Co., S. F.

COPP'S HANDBOOK OF MINING LAWS.—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc., 1877. Pocket size, and very handy and convenient for miners. Post-paid, \$1.00. Sold by Dewey & Co., S. F.

**A New Edition.**

KUSTEL'S ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. Illustrated. 156 pages. 1880. A valuable and carefully written work. Postpaid, \$3.00. Sold by Dewey & Co., S. F.

**M. B. DODGE,****First Premium.****STONE BREAKER AND ORE CRUSHER.**

The Dodge Rock Breaker CHALLENGES THE WORLD to produce as good and cheap a machine. Rock Breaker and Cornish Rolls Combined in one Machine. Pulverizers to granulate Ores for Roasting, chloriding, leaching & concentrating.

M. B. DODGE, 431 Fremont Street, S. F.

**PACIFIC POWER CO.**

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

The Great Storm.

There has been a great storm, in fact one of the most severe ever known in the State, and the water in the great rivers of the interior has reached a higher mark than has been heretofore recorded. There have been grievous losses by overflow and washouts and landslides at different points in the northern half of the State. There is also the indirect loss and inconveniences of having the ground rendered wholly unfit for work, and idleness is thus forced upon some farmers, while others have had to lament the destruction of their property by the floods. From Shasta, yes, even from the Columbia river on the north, down to Sacramento valley on the south, the disasters have been numerous although within this borders of our State there has been no loss of life reported. Our space will not permit us to give all the details of the floods which have come to hand by telegraph, but we will call a few from which others may be inferred.

At Shasta on Sunday, the rainfall in four hours and thirty minutes was 10.4 inches. The rain just poured down in sheets. The bridges over the large creek, near the Union church, were all carried away, and came near carrying away the residence of I. Bshrie. During the progress of the storm a large landslide occurred, carrying off a large piece of the mountain back of the residence of William Daniels. Such a rain storm has never been known at Shasta.

The Sacramento river was higher than ever known before. Considerable damage has been done. Nearly all the strams and creeks on the roads leading to Shasta are so high that it is almost impossible to cross them. The rainfall for the season, to Feb. 2d, was 80.8 inches.

At Marysville, nearly five inches of rain fell during the storm up to Sunday, swelling the Yuba river to a greater height than was ever known. In the notable flood in 1875, when the city was inundated, the highest flood marked was 16 ft. Sunday at 3 o'clock the water-gauge marked 17 ft. and 4 inches, when it began to recede. The levees were guarded in all weak places. There is no water inside the levees, except surface water on some back streets. The farms lying in the flooded districts of Sutter county will undoubtedly suffer considerable loss. Reports from there are meager, travel being cut off by the water.

At Sacramento on Monday, the Sacramento river reached its highest point ever attained here—26 ft. and one inch; to-night the river stands at 25 ft. 11 inches. The breaks in the levee 3½ miles below the city are not so bad as at first supposed. On the Yolo side there are three breaks in the levee below the city, one of them is opposite the southern boundary of the city. The town of Washington is inundated by back water.

At Napa the river was a foot higher than ever before, and the water was over a foot deep in the streets. In many of the stores the water did considerable damage. Fences and several houses were washed away. The water subsided on Monday, and the streets presented a picture of destruction. Sidewalks and culverts were washed away, and the town was covered with a deposit of mud from 5 to 12 inches deep. The railroad roadbeds were washed out in many places.

At Stockton the slough rose seven ft. above low water mark, and the other sloughs were bank full. No damage is reported in the immediate vicinity of Stockton, unless it be to grain lying out in sacks in the fields.

At Nevada City the water in Deer creek is 15 inches higher than it was in the year 1861, at the time of the heavy floods. Considerable damage has already been done. Foot bridges have been carried away, and washouts and landslides are reported.

At Columbia, Tuolumne county, the storm is pronounced by far the severest storm ever had in that section, and on Monday it was raining hard with no sign whatever of clearing up. Travel by stage had been interrupted. They had no mail or express for two days.

At Merced on Tuesday, the Merced river was at a very high stage, overtopping the banks and suspending all travel across that stream by damage to ferries. The Coulterville stage, Monday, hound for Merced, connected with the passenger train at Turlock. This was the only way passengers from the north side of the river could reach Merced.

At Santa Cruz it is said that the damage caused the powder works property will approximate thousands of dollars to repair. Considerable damage was done to the property of Davis & Lowell at their lime-kilns. No mails or express matter have been received here from Friday to Monday. An engine of the South Pacific Coast railroad was reported huried by a slide in the road. The Howe truss bridge of the Santa Cruz and Watsonville railroad, or two-thirds of it, lies on the beach a quarter of a mile below where it went into the bay.

The railroad trestle work across the Salinas river, at Castroville, was carried away by the high water this morning, this being the second time this winter.

The bonanza mines have discharged 80 men from the slopes, the cause assigned being that the ore was getting to be of too low grade to pay mining and milling expenses. Some pay ore remains, and prospecting about the old slopes is continued.

A POLICE raid on keno games in St. Louis on Monday night resulted in the capture of 150 persons.

Chair Manufacture in San Francisco.

This establishment of Heywood Bros., chair manufacturers, occupies three floors in the large building, Nos. 559 to 595 Mission street. The business comprises the manufacture of cane and wood seat chairs, and rattan and reed furniture of all kinds. The house in this city is the sub-growth of the home center at Gardner, Mass., that factory having been established so long ago as the year 1826, by Mr. Levi Heywood, now the oldest chair-maker in the United States. This gentleman, although between 80 and 90 years of age, is still actively engaged in his chosen occupation, which he has assiduously followed for more than half a century.

The home establishment of the Messrs. Heywood brothers claims the honor of being one of the largest chair factories in this country, giving employment to about 1,100 hands, and turning out not less than 2,000 chairs per day. The works include within their grounds a machine shop, iron foundry and varnish factory, where is made all the complicated machinery, castings and varnishes used in the manufacture of the chairs. For years the company have imported their rattan direct from Calcutta, in quantities not only to suffice their own consumption, but to largely meet the demands of other similar establishments throughout the Atlantic States.

In order to bring their goods more directly before the public, branch factories and wholesale depots have been located in New York, Philadelphia, Baltimore and this city, the latter being under the management of Mr. S. W. Fuller, formerly connected with the firm of Huls & Co., New York. The growth and prosperity of the factory in this city during the last five years sufficiently evinces the fact that this concern is fixed upon a firm and abiding basis. In their sample rooms, on Mission street, may be found fully 300 different styles of goods, embracing rattan chairs, rockers, patent rockers, sofas, music stands, foot-stools, ladies' work baskets, etc.

Formerly all articles in this line were brought from the East to this coast "made up," as the technical phrase has it, in assorted lots; and since lightness and bulkiness characterizes these goods, a high rate of measurement was the inevitable result, involving a large outlay of capital for freight purposes alone. This was found to be so serious a detriment to the business that the company determined to establish a factory in San Francisco for this particular branch of the trade. The plan was put into execution about one year ago, and now, about 20 boys and girls are employed in putting up the work; a craft which seems peculiarly adapted to the facile hands and nimble fingers of youth. To deftly fashion a modern rattan chair-seat, or unite strength, durability, lightness and grace in fabricating the back of a fancy rocker out of the attenuated filaments of cane and bamboo, requires the creative skill of hands alone. Elaborate machinery comes powerless to the task; a conclusion rendered entirely obvious by a glance at the beautiful articles on exhibition in the salesroom.

The business is steadily on the increase, the house finding a ready sale for its wares throughout this coast, including British Columbia, Mexico, Central America, Australia and Japan.

Besides the work already mentioned as being done here, there is required an essentially home manufactory, giving employment to about 50 hands, in the various departments of setting up, varnishing, polishing and upholstering each work as is brought "in the rough" from the East.

The aim of the factory is to supply country dealers with everything in the line of a chair, from the old-fashioned wood seat, so highly prized by our grandfathers, to the new and beautiful designs of East Lake and Queen Anne in maple, oak, walnut and ebony gilt.

Finally, to the good name of this house it may be said that it buys all of its varnishes, in no inconsiderable quantities, from San Francisco makers and dealers, thus clearly evidencing that the proprietors practice as well as believe in the principle, "Live and let live."

THERE are about 150 Chinese in San Diego county. There are 39 school districts, taught by 43 teachers. The highest school is located on Smith's Mountain, 4,700 ft. above the level of the sea. School property is approximately valued at \$20,000. Something like 1,000 school children are recorded.

KARSTENS' BEER FAUCET.—Charles Karstens, corner Jackson and Sansome Sts., in this city, has recently invented a beer faucet which possesses several advantages. It is very simple in construction. The faucet screws into the head of the barrel and there is no possibility of its flying out, or of the escape of any gas. The key of the faucet is so made that it will not wear out, nor get leaky, because there is no hammering to get the faucet in. Brewers in using this do not need wooden plugs, nor does the hole get enlarged. The patent faucet will outlast the barrel, and the inventor claims it will outlast any other form of faucet. With this Mr. Karstens says only half the number of faucets is required, as any one can change and set them with the necessary key; while without the key no one can tamper with or draw the beer. He is fully convinced that the saving in the cost of the number of faucets will alone pay for the cost of the patent faucet.

News in Brief.

TRAINS are delayed by heavy snows in Minnesota.

VANDERBILT owns \$50,000,000 in Government bonds.

THE 3% dividend of the Central Pacific stock is being paid.

THE Census Bureau at Washington employs 1,247 persons.

THE RISING MONTHLY OF THE DAY. YEARLY SUBSCRIPTION \$4. Single number 35 cents. AGENTS WANTED in every town and village of the United States to canvass for this popular magazine. The most liberal commissions will be paid to responsible parties. This is a chance to make money at your own home. Address THE CALIFORNIA PUBLISHING CO. (P. O. Box 2319) 202 Sansome St. S. F.

Quinine and Arsenic

Form the basis of many of the Ague Remedies in the market, and are the last resort of physicians and people who know no better medicine to employ for this distressing complaint. The effects of either of these drugs are destructive to the system, producing headache, intestinal disorders, vertigo, dizziness, ringing in the ears, and depression of the constitutional health. AYER'S AGUE CURE is a vegetable discovery, containing neither quinine, arsenic, nor any deleterious ingredient, and is an infallible and rapid cure for every form of Fever and Ague. Its effects are permanent and certain, and no injury can result from its use. Besides being a positive cure for Fever and ague in all its forms, it is also a superior remedy for Liver Complaints. It is an excellent tonic and preventive as well as cure, of all complaints peculiar to malarious marshy and miasmatic districts. By direct action on the liver and biliary apparatus, it stimulates the system to a vigorous, healthy condition.

FOR SALE BY ALL DEALERS

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

THE MINING AND SCIENTIFIC PRESS finished its 41st volume with its last publication. We do not know the circulation of the paper in this community, but we do know that every mechanic and miner ought to take it, for by so doing they would benefit themselves far more financially than they are aware of.—Shasta Courier.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and leather binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by letter.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

### DIVIDEND NOTICE.

OFFICE OF THE

### Silver King Mining Company.

San Francisco, February 1, 1881.—At a meeting of the Board of Directors of the above named Company, held this day, a dividend (No. 14) of Twenty-five (25) Cents per share was declared, payable on Tuesday, February Fifteenth (15), 1881, at the office of the Company, Room 19, 323 Montgomery Street, San Francisco, Cal. Transfer books will be closed on February Tenth (10), 1881.

JOSEPH NASII, Sec'y.

### DIVIDEND NOTICE.

OFFICE OF THE

### Standard Consolidated Mining Company.

San Francisco, February 2, 1881.—At a meeting of the Board of Directors of the above named Company, held this day, dividend (No. 25) of Seventy-five (75) Cents per share was declared, payable on Saturday, February Twelfth (12), 1881, at the office in this city, or at the Agency of the Nevada Bank of San Francisco, in New York.

WM. WILLIS, Sec'y.

Office—Room No 29, Nevada Block, No. 309 Montgomery Street, San Francisco.

### ANNUAL MEETING.

The Annual Meeting of the Stockholders of the REAL ESTATE AND BUILDING ASSOCIATES will be held at the office of the Company, No. 230 Montgomery Street, on Monday, the seventh (7) day of February, 1881, at twelve o'clock noon of said day.

LUIS F. EMILIO, Sec'y.

### Booth Gold Mining Company.—Location of principal place of business, San Francisco. Location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the Second (2) day of February, 1881, an assessment, No. Three (3), of Three (3) Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room No. 44, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Seventh day of March, 1881, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the Fourteenth (14) day of March, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors.

GEO. R. SPINNEY, Sec'y.

Office—Room No. 44, No. 310 Pine Street, San Francisco, Cal.

### Blue Bird Mill and Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Globe District, Pinal County, Arizona.

Notice is hereby given, that at a meeting of the Board of Directors, held on the Eighth (8) day of January, 1881, an assessment, No. one (1), of Five (5) Cents per share was levied upon the capital stock of the corporation, payable immediately, in U. S. gold coin, to the Secretary, at the office of the Company, No. 10 Market Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fourteenth (14) day of February, 1881, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the Fourteenth (14) day of March, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

W. H. KNIGHT, Sec'y.

### A NEW TREATMENT

—FOR—

Consumption, Asthma, Bronchitis, Dyspepsia, Catarrh, Headache, Neuralgia, Debility, Rheumatism,

And all CHRONIC and NERVOUS DISEASES.

PACKAGE CONVENIENTLY SENT BY EXPRESS, READY FOR USE

### AT HOME.

A Treatise on Compound Oxygen, giving the history of this new discovery, and a large record of most remarkable cures, will be mailed free to all who ask for it. Also, "Health and Life," a quarterly journal, containing much interesting information. Write for it. Address the proprietors, DR. STARKEY & PALEN, 1109 and 1111 Girard street, Philadelphia, Pa., or H. E. MATHEWS, 606 Montgomery street, San Francisco, Cal., from whom can be procured both information and supplies.

### ST. DAVID'S.

A FIRST-CLASS LODGING HOUSE

CONTAINS 113 ROOMS.

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the interior. No dark rooms. Gas and running water in each room. The floors are covered with holly Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from \$2.50 upwards.

R. HUGHES, Proprietor.

At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

### LEACHING

### Gold and Silver Ores,

By C. H. AARON.

Board, with Room, \$1, \$1.25 and \$1.50 per day. Special rates by the week or month.

FREE COACH TO AND FROM THE HOTEL.

## '49 AND '50.

MR. JOHN VANCE CHENEY'S new historical story of early days upon this Coast will be commenced in the next number of "The Californian."

A NEW SERIAL STORY will be commenced in the next number of THE CALIFORNIAN which will run during the remainder of the year. It is entitled "'49 and '50," and is a story of early days upon this coast. The author is Mr. John Vance Cheney, whose articles in the leading Eastern magazines and in THE CALIFORNIAN have received such wide and merited recognition. Mr. Cheney has had this story in preparation for THE CALIFORNIAN for some time. Competent critics, to whom it has been submitted pronounce it at once realistic and fascinating. The stirring events of 1849 and the succeeding year are vividly pictured. Absolute truthfulness of impression is sought rather than idealization. A thread of romance runs through the work, and the interest is sustained to the end.—(Note Book).

NOW IS THE

## TIME TO SUBSCRIBE.

"This magazine is only in its second year, but the merit shown renders it worthy of patronage from all parts of the country."—[Liberal Press, Woodbury, N. J.]

"An exceptionally bright periodical."—[New Haven Palladium.]

"A welcome visitor comes to us each month from the far off Pacific Coast. It is THE CALIFORNIAN, whose literary worth compares well with Eastern contemporaries. The January number is brimful of good things."—[Louisville Post.]

"There is a long list of attractive contents. It is an excellent number of a very good magazine."—[Philadelphia Inquirer.]

## HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretensions claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

## SECURE PATENTS

Through  
Dewey & Co.'s Scientific Press Patent  
Agency.

OUR U. S. AND FOREIGN PATENT AGENCY pre-  
sents many and important advantages as a Home  
Agency over all others, by reason of long estab-  
lishment, great experience, thorough system, in-  
timate acquaintance with the subjects of inven-  
tions in our own community, and our most  
extensive law and reference library containing  
official American and foreign reports, files of  
scientific and mechanical publications, etc. All  
worthy inventions patented through our Agency  
will have the benefit of an illustration or a  
description in the MINING AND SCIENTIFIC  
PRESS. We transact every branch of Patent  
business, and obtain Patents in all countries  
which grant protection to inventors. The  
large majority of U. S. and Foreign Patents  
issued to inventors on the Pacific Coast have  
been obtained through our Agency. We can  
give the best and most reliable advice as to the  
patentability of new inventions. Our prices are  
as low as any first-class agencies in the Eastern  
States, while our advantages for Pacific Coast  
inventors are far superior. Advice and Circu-  
lars free. DEWEY & CO., PATENT AGENTS.

## Alaska Mines.

Arizona to the south and Idaho to the north have been the latest centers of mining excitement; but now it looks as if the northern fields were to be extended to Alaska. For the past few months rumors of rich discoveries of ores at different points in Alaska have been rife. The steamer *California*, which arrived this week, brought news that great excitement now prevails in Alaska about the newly discovered Takon mines, on the Takou river, some 80 miles only, north of Sitka.

The quartz croppings, which have occasioned this present excitement, were found some two months since, near the Takou river. Ore from the prospects has assayed up into the thousands. There are now about 50 men at the new camp, and some 11 or 12 claims have been taken up.

There is a great deal of snow in the region about the new mines, and it will be impracticable for miners to do much before the end of March. The snow is very deep. A road is being cut through to the new mines. The steamer *California* will take back a lot of timber for the district.

Of course, as it is with all new gold discoveries, there is probably a great deal of exaggeration about the richness of the "mines," and the fact that the deep snow prevents exploration will warrant such stories for some time to come.

The people at Sitka and throughout will probably be able to take care of all the claims there are to be taken up without any assistance from California, so that our miners who are looking out for jobs, will probably do as well to stay at home and let the Alaskans work the Alaskan mines.

## Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening last.

Donations to the museum: Seven specimens of ores from John T. Reed, San Bernardino county; from Capt. C. L. Hooper, of the U. S. revenue steamer, *Corwin*, tanned seal skin vest, made by Innuits at Point Belcher; also two fur shirts; also pair Inuit boots; W. J. Fisher donated four bottles containing crustacea from Kodiak island, Alaska; from C. G. Yale, Indian implements, bones of stone and one bone; also the left valve of *Schizothorus Nuttallii* found in a cut while digging the Army street sewer in San Francisco, in 1880; from W. H. J. Brooks, Bakersfield, Kern county, plant and fiber growing along the margins of streams in Kern county; also, from Capt. Hooper, jute fiber and nettle fiber. A very interesting and exhaustive paper was read entitled "Sericulture in California," by Miss T. H. Hittell. Dr. Hermann Behr read a paper on "A Fungoid Growth on the Grape Vine." Mr. J. G. Lemmon presented a list of some of the new and rare ferns of California and Arizona. He also read a paper on "Pacific Coast Arctiids," illustrating his remarks with specimens of the various locusts found in this State. Paper on "Sea Otter" by W. H. Fisher, Alaska, was read by the Secretary. Thomas E. Fraser was elected a life member; and Henry E. Mathews, Frank Jaynes and Rev. Horatio Stebbins were elected resident members.

**MECHANICS' INSTITUTE.**—The annual election of the Mechanics' Institute was held on Tuesday. Only one ticket was in the field, which was elected with the exception of C. N. Cook, who was defeated by C. Waterhouse. One hundred and forty-nine votes were polled, and the following are the names of the new Trustees: Richard J. Gray, Assistant General Freight Agent Central Pacific railroad; James Spires, foundryman; James Drury, contractor; Asa B. Wells, Mechanics' mill; George Spaulding, printer; A. W. Starbird, lumber dealer; C. Waterhouse. The new officers will be installed in March.

## Mining Property in Mexico.

Considerable attention is now being turned to mining matters in Mexico, and this coupled with the fact that several important railroad enterprises are being inaugurated, leads to the conclusion that that country will become more familiar to the Americans than it has hitherto. There are many persons of late who have been through the northern portion of Mexico on the lookout for mining properties, but they have not seemed so easy to acquire as might be, nor are all the conditions for working them as favorable as in this country, notwithstanding labor is cheap.

There are other considerations, too, not well understood, that detract from the value of properties there. We most recently a gentleman who has just returned from an extended trip through Mexico, and who corroborated our impression relative to the difficulty of acquiring property there. In an interview with the gentleman referred to, he gave us in effect the following statement:

We left New York city in March, arrived in Matamoros about April 20th. From there we traveled muleback to the city of Chihuahua, which we found so unhealthy—small-pox, yellow fever and other malignant types of disease prevailing—that we pushed on to Durango, our objective point being Alamos, State of Sonora. Durango is virtually a city of gamblers and cock-fighters, and consequently does not enjoy that perfect peace and tranquillity that characterizes the moral hamlets of the United States. A governmental mint is located here, to which great quantities of bullion are sent. There seems to be a fair amount of business done, but there is much poverty noticeable. In short, Durango can truly be called a city of refuge, where congregate the vagabond populace of adjoining States. There is a defined socialism, a seclusive aristocracy descended of the old Castilian hidalgos, who are courteous, refined, exceedingly hospitable, very conservative of their entertainment of strangers until they are well assured of their gentility, etc. Here, as elsewhere throughout Mexico, exists the greatest suspicion of all strangers, Americans especially, to the extent that I have known them to refuse the most extravagant offers for real estate; and I am sure desirable properties cannot now be bought simply by a process of hargain and sale. Indeed, real estate transactions involve as much diplomacy and formality as would be used by great governments in national matters. This is not so much the case in Chihuahua, where the influence of American thrift and enterprise is already felt, or to where the Apache in times past has paid predatory visits; here they are eager to sell, and do, for incredibly low figures. In the great "Anro" basin of Sonora, that section contained within the limits of Arispa and Souqui to the north and south-west, and Moraa to the southeast, a country

which tradition and investigation has determined beyond all question as the particular place of deposit of the great mass of gold, money, however much is offered, is no inducement to sell, for they say, "What need have we for your money when just beyond our doors we can pick out all the gold we have need for, a bank that never suspends and enduring as time itself?"

If American capital seeks investment in the most desirable portions of Mexico it must command a territory not yet entered upon by a

Steel Bars for Mining Drills.

single American, a section alternately mining and agriculture lands comprised within the limits I have mentioned. The immigration to Chihuahua and Sonora has hitherto misdirected. The geology of California is in no wise the geology of Mexico, consideration of this difference has not seemed to meet the attention of the hundreds who have mistaken "Scoria" for true rock, etc. It was my good fortune to have for my traveling companion Col. Rivera, a gentleman of wealth and position, and one of the most distinguished of Spanish engineers. He had visited Arizona, had followed the mountain down into southernmost Mexico, and his judgment was that all the indications led him to believe that the bulk of gold was in the region described. An effort is now being made to acquire large tracts of country about here and develop the mines, but I question its success until the railroads now being advanced into that undeveloped section can be made available for the safe carriage of ore. These lands are held under old Spanish grants, having the feudal consideration, and a good title cannot be obtained without a tedious process of polity and under a guarantee of good faith.

Plate Amalgamating Apparatus.

Another field for exploration is the pharmacopoeia flora of Sonora. Indigenous plants used by the Indians in the treatment of febrile diseases produce the happiest results without any of the ill consequences marking the administration of the strong remedies of our *materia medica*. I have seen typhoid troubles cured with a few simple herbs gathered from the hill sides, and so complete is their knowledge of the effect of these herbal plants that when the disease is determined, the remedy is invariably the same. When a more thorough investigation is made of this subject by scientific men, many additions will be made to remedial agents.

## New Amalgamating Apparatus.

Paul Desnolle, of Paris, France, has recently invented an amalgamating apparatus of limited dimensions and small cost, which will allow of the treatment of comparatively large quantities of pulp in a short time. The object is to place the amalgamation plates in a small space, so they can easily be got at to be cleaned or prepared, while, at the same time, they are under lock and key, and safe from molestation. In order to attain the end sought, a series of plates, alternately fixed and rotary, are arranged in a vertical series; and these being amalgamated, the pulp is caused to traverse them serially under the action of the centrifugal forces and gravity. The plates are inclosed in a casing with hinged sections, so that it may be opened to give access to the plates, or closed and locked when desired. The fixed plates are attached to this casing, and are made in parts; so that when the sections of the casing are turned on their hinges, the plates are divided, and appear like shelves. The whole interior of the apparatus may, in this way, be exposed. The fixed plates are considerably concave on the upper side, and, consequently, when divided, access is more readily had to their surface for the removal of deposited material.

In the engraving, A represents a series of amalgamated plates named on the shaft B. The latter is supported on bearings, and is revolved by suitable gearings. As steam power is conveyed through the bevel gears, C, from a belt running on pulleys, D.

A cylindrical casing, E, encloses the plates and shaft. It is made of sheet or wrought iron, for example, and is composed of four movable sections, hinged to upright rods extending from the bottom to the top plate of the apparatus. On the interior of each section is a series of amalgamating shelf plates, F, in the form of sectors, so that when the casing is closed they form fixed concave plates, which alternate with the rotary plates, A.

In the center of these plates, F, is an opening somewhat larger than the exterior of the shaft B, so as to leave a space between for the passage of the pulp.

The casing may be locked up by means of an ordinary padlock.

After the plates are amalgamated the case is closed, the pulp is admitted above, and the shaft B is rotated. The pulp falls in the conical part of the first plate, A, and expands over its surface. Under the influence of centrifugal force it runs over the edge and falls upon the fixed plate F, below it. This plate being concave, its own weight carries the pulp to the center and through the opening on the next rotary plate. From thence it passes to the next fixed plate, and so on, the tailings passing off below.

The number and dimensions of the plates, and the velocity of rotations should vary with nature of the gangue. When desired, the casing is opened and plates cleaned by a rubber, the amalgam being thus removed.

## Steel Bars for Mining Drills.

Drills made for mining purposes are usually made by forging from octagonal bars. The end of the bar, for an inch or so, is fixed into the required form of a drill, leaving the rest of the bar in its original form. Wm. A. Sweet, of Syracuse, N. Y., has patented, as an improved article of manufacture, rolled bars of steel, of the shape shown in the accompanying drawings.

This construction of drill steel produces a piece accurate in cross section, so that it can be worn up its entire length without re-forging. It consists of a blank rolled from a bar of steel, without forging or swaging. The steel bar, cut to proper length, is rolled into the form desired, ready, when taken in hand by the smith, to form a complete drill for use by adding a shank thereto; and having the same contour through its entire length, it can be used until it is worn up to the shank without any change of form.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eos

### Foundry Work on the Comstock.

EDITORS PRESS:—Some time since our local papers gave a short account of the casting of a balance wheel for the Yellow Jacket pump. I have visited the foundry of George Emmett, Gold Hill, where this immense piece of work has been done, and found this wheel so large that it was impossible to put it together without being obliged to cut through the building in several places. I believe it is the largest casting ever made, outside of San Francisco, on this coast. The center piece is 14 ft. in diameter and weighs over 21 tons. The rim is something over 30, and contains three tons of wrought iron. The entire weight of the wheel is 52 tons, and is altogether a very fine piece of workmanship. It was constructed under the direction of J. B. Pitchford, Superintendent of the foundry. It is now ready for removal, and as soon as the roads are in a fit condition it will be taken to the "Jacket mine." It is expected, all things being favorable, to have it put into position about the middle of this month, when I hope to be able to give you some account of the working of the same.

Business as a general thing is quiet. I understand that there was another draft yesterday, by which about 84 men were thrown out of employment. Yet, notwithstanding this, I still find considerable activity about the Hale & Norcross, which was destroyed by fire a few weeks ago; since which time the unused buildings of the Con. Virginia have been transferred to the scene of disaster, and now take the place of the burnt building. The debris having been removed, such machinery as was destroyed has been replaced by that from the Con. Virginia, and is entirely under cover, and things, I hope, will soon be in working order again.

Of course many of the old Comstockers feel very blue at the great depression in business, but I think there is too much capital invested in this locality to have the bottom fall out of everything so suddenly, and though dull at present I trust things will soon take a favorable turn. We often hear of "the darkest cloud having a silver lining," and it may be so now on the Comstock; at least let us hope it will be so, and look for better times than ever before.

HECTOR.

Virginia City, Nev., Feb. 4, 1881.

Since writing the above I find, in the Virginia City Chronicle, the following item:

At 9 o'clock this morning, Thomas Gallagher started from Emmett's foundry, in Lower Gold Hill, with the big iron hub for the new balance wheel that is to be put up at the Yellow Jacket works. The casting weighs 21 tons, and is so large that it could not pass through the railroad tunnel at Gold Hill. Forty-two horses were required to haul the truck, on which it was placed, up the hill to the divide, when 22 of the horses were taken off. The casting was taken to the old railroad depot in this city, where it will be placed on a car and taken to the Jacket works. In order to get it through the Virginia tunnel it will be necessary to remove three sets of timbers from the south end.

The bringing of this casting from Gold Hill proved to be a greater undertaking than was expected. Everything went all right until the divide was reached, when one of the big wheels of the truck went through into a sewer, and it took three hours hard work with hydraulic jacks to get it out. The next point of interest was at the corner of Taylor and C St., where the turn for the down-hill grade to the depot was made. Here fully 500 men were congregated, each ready with a good plan for accomplishing the dangerous trip down the grade. When opposite the Chronicle office, one of the wheels again sank into a sewer, making another delay, and necessitating the employment of a great number of horses. A hack-action was hitched to the truck, loaded with pig iron. This was rough locked, and was intended as a drag or break to the truck.

THE ATCHISON, TOPEKA, AND SANTA FE.—W. B. Strong, Vice-President and General Manager of the Atchison, Topeka, and Santa Fe railroad, states that a connection will be made with the Southern Pacific road on or about March 15th, and that as soon after that as possible, through trains will be run between San Francisco and Kansas City. It is also understood that just as soon as the connection is made, work on the branch to Guaymas will be suspended from the east. The reason is said to be that there is no duty on rails and material landing at that port, and that rails can be shipped from Europe by way of Cape Horn at less than half what they cost in this country.

SLAG FOR FLUX.—The slag dump at the K K furnace, in South Eureka, has been purchased by Mr. Cy Horn, who is sorting it over for flux at the Atlas. The sorting is done to obtain the best of it, and the run of the Atlas furnace shows that the old K K did not do its work very well.—Eureka Sentinel.

### Tunneling in California.

The Isabelle Works, Alpine County. The cost of tunneling in this State, of course, varies very materially with the locality and with the tools used. It is not always, however, that we are able to obtain the exact figures. Through the courtesy of Mr. Lewis Chalmers, managing director of the Isabelle gold and silver mining company, Limited, an English company whose works are at Silver Mountain, Alpine county, in this State, we are enabled to publish the annual report of the company, which gives some interesting facts concerning the cost of tunneling. At this tunnel they cast their own car wheels, make their own pipes and have facilities for storing 50,000 lbs. of powder, as well as other supplies for the winter months. The report referred to is as follows:

MY LORD AND GENTLEMEN:—I have the honor to transmit herewith account of our receipts and disbursements for the bygone year, showing, under different heads, the cost of every department of the work, and also the cost per ft. of tunnel, which I am glad to say is, under my estimate, only \$26.16 instead of \$30. I have also the honor to present to you the following report:

For 11 months and 10 days, until I had your order to stop, the work has been steadily prosecuted, and we have run 2,958 ft. of 9x8 tunnel through hard rock. We drilled 10,283 1½-inch holes, 79,485 ft., blasted 12,424 times, extracted 26,192 tons of rock, and gained by each blast (594) 4 ft. 11 7-10 inches. To accomplish this we sharpened 5,619 drills. (For further particulars allow me to refer you to Appendix No. 1.)

Two No. 2 National Coy's drills of 3½ inch cylinder, driven by compressed air furnished by two of the same company's compressors (each 12 inch cylinder, 4½-inch stroke), at an average steam pressure of 75 lbs. and air pressure 90 lbs. did the drilling. One compressor was generally held in reserve in case of accident, although we occasionally encountered rock so hard as to necessitate the use of both.

The holes were charged with Vulcan powder, either No. 1 or 2 as the rock required, and exploded by a Laffin & Rand magneto battery, with fuses furnished by that company, both of which have given perfect satisfaction. I prefer Vulcan to any of the other high explosives.

Up to the beginning of March, much time was lost owing to the sickness of the miners caused by the deleterious fumes arising from the explosion of the nitro-glycerine compound used in the powder.

Since the introduction of the large Baker blower, the header has been supplied with an abundance of pure air, and we have no trouble from this cause.

To drive this slower, the lathe, drill, and circular saw, used for preparing timber and track material, a 40-horse power engine was added in August; which I purchased in San Francisco, at about half its original cost, and which is now as good as new.

As the tunnel progressed the pressure of water became insufficient to force the drill cuttings from the 8-ft. drill holes, but this was overcome by extending the water pipe about 1,000 ft. higher up the canyon, tapping the mountain stream at an elevation sufficient to ensure the requisite pressure (90 lbs. per square inch).

The trestle work crossing the creek has been extended 800 ft. to furnish dumping ground, with which we are now well provided.

As winter approached it became necessary to provide accommodation for 12 mules. I have therefore built a substantial stable, with grain and hay loft, of a capacity to hold six to eight months winter feed, and which are now full.

Thirteen new cars, carrying 5,000 lbs. each, have been added to the rolling stock. As we advance more will be necessary.

A commodious magazine capable of storing 50,000 lbs. of powder for winter use has been built of brick, in the side of the mountain, at a safe but convenient distance from the works, well drained and ventilated, arched with brick and covered with Portland cement. The winter supply is laid in. From the magazine a tramway delivers the powder to the thawing house thence to the tunnel. The thawing house is so constructed that, in cold weather, the powder can be quickly put in condition to do the greatest execution, the temperature being raised by steam conveyed by a pipe from one of the boilers.

A small building, occupied by the foreman as an office and sleeping room, has been erected near the tunnel mouth.

Finding it cheaper to buy our galvanized iron for our large air pipe, in San Francisco,—in consequence of the freight on made pipe being so high, and have it made at the works,—I engaged a tinner, and erected for the purpose a large building close to the tunnel mouth.

The engine room has been enlarged to receive the new engine, lathe, blower, circular saw and drilling machine, before referred to.

Car wheels became an expensive item, a set being cut through by the track iron from constant work in a very short time. Toward the close of the year, therefore, I built a cupola furnace, and make my own wheels. From three runs we had 47 car wheels and nine drill arms, at a cost not exceeding the freight on new castings from San Francisco. We re-cast the worn wheels and all the broken castings about the

works. A complete set of compressed brass valves were also cast and turned, worth, to buy, \$50 a set, and I propose to manufacture these various parts of the drills and other machinery which are constantly wearing out, also grate bars, and when required, shoes and diss, etc., for the mills; the only addition to the force being a molder.

At 2,750 ft. from the tunnel mouth we cut through a fissure, the foot wall of which was composed of a clay slip, in which were embodied detached fragments of quartz producing what are known as swelling ground, necessitating the frequent renewal and easing of the timbers and track which at this point are constantly shifting their position.

At the 3100 ft. the tunnel entered another ledge, running nearly at right angles with it; the foot wall marked by a narrow stratum of quartz, assaying \$30 per ton in gold. The ledge matter extends 120 ft. in width.

At the 3950 ft. we were almost inundated with water, which still continues to flow, but gives no trouble.

At the 4300 ft. we struck a ledge of quartz, clay and sulphurets, about four ft. wide assaying from \$4 to \$5 in gold.

At 4429 ft. we entered another body of similar material, which we were still in when the work was suspended.

Up to the time of my getting the diamond drill I had no money to expend on explorations at these points by drifting, which runs away with the tunnel funds; but as core holes with the diamond drill can be run at about \$1.50 per ft., I propose to run the drill at the following points: At the 1,250, 75 ft. farther north; at the 1,700, 200 ft. south; at the 1,950, 200 ft. south; at the 3,100, 75 ft. south; at the 3,250, 500 ft. north; and at the 4,300, 100 ft. south.

At all these points there are ledge indications, but cross formations running diagonally with the tunnel, impoverish and almost destroy them on the tunnel line. Cutting through these cross malformations, I expect to find them, or some of them, free, and therefore ore-producing.

To prove this theory, I directed the ground to be opened on top at the 1,250 ft. by two pits sunk on the line of the supposed ledge north from the destroying porphyry, one pit at 500 ft., and another at 600 ft. distant from said porphyry and in each pit found vein matter—making the presence of a ledge beyond dispute.

In 1879, a drift was started at the 1,250, to cut through this porphyry and run 200 ft. at right angles to the tunnel. When the diamond drill arrived, it was started at the face of this drift, and when work was suspended, it was penetrating the ledge.

None of the ledges I have mentioned are the Silver Mountain, the vertical of which, from a recent close personal survey and examination of the ground will not, I think, be reached under 5,320 ft., and assuming the dip to be west, or away from the tunnel mouth (as, contrary to my expectations, it has been in all the ledge formations we have cut), we may not reach the ledge itself till we get to the 3700. Here, also, we shall have to drift through another destroying formation, which, though it may not cut off entirely, will, in all probability, greatly impoverish it at this point. This drift may have to run 600 ft. at a cost of six dollars a foot, which will be amply repaid on reaching the ledge where free; but we may strike it free for a short distance after running only 200 ft.

This ledge is about 150 ft. in width, and carries its ore on both hanging and foot walls with a break or horse in the center about 60 ft. wide; a fact which is characteristic of this group of fissures.

About 150 ft. from the hanging wall we may expect to find the Sandy gulch, and from that to the 7200, the lodes of the company cover the ground. Of these the Adolphus and Pine Tree are the most important. The vertical of the I X L passes through the tunnel near 7680, and of the Exchequer, at 8000 or 8200, although because few of the ledges through which the tunnel passes carry their outcrops to the surface on the tunnel line, it is no easy matter to fix those points with certainty. Had it not been necessary to lay off the line between two fixed points so as to meet the requirements of the three companies, the tunnel could have been carried so much farther south as to run under the Isabelle ledge where they do crop up on the surface; but so laid off, the tunnel would have been much longer.

That you will find in all of these lodes, where free or undisturbed by more recent worthless formations, rich bonanzas, I have not the remotest doubt; and I say so with the utmost confidence when I call to mind that, with my own hand, I have taken ore from the Pine Tree, assaying from \$30.96 to \$69.70 per ton; from the Adolphus, specimens worth \$95.46 per ton; from the Exchequer, \$4,000 to \$5,000 per ton, and, that from the I X L croppings, over \$100,000 were milled in the old Pittsburgh & Davidson mills. It was from a spot only, comparatively speaking, that the millions of dollars were produced that rewarded the perseverance of the fortunate owners of the honanza mines on the Comstock. Here you have so many lodes, and so well defined on the top as well as where they have been opened at depth, and therefore so many chances. Your tunnel secures to you the mining and milling of your ores at so cheap a rate that success, I humbly submit, is placed beyond a peradventure. I have the honor to remain, my lord and gentlemen, your most obedient servant,

LEWIS CHALMERS,

Managing Director,

Silver Mountain, Cal., Jan. 22, 1881.

### California Petroleum

During the last year there has been a noteworthy general advance in the development of the California petroleum oil trade. In twelve months the daily production of crude oil in this State has been doubled. At the present time seven new wells, in addition to those which are already in operation, are in process of drilling, and there is every indication that by a similar date next year the yield will be twice as large as it is now. It is not unsafe to say that the trade in oil of home production has now reached a point from which it will not go backward, but will be enlarged and increased in the future with perhaps astonishing rapidity. It has long been known that this State included immense deposits of oil, and it has often been said that California would some time be the largest oil producing district in the world. The size and importance of this State as a source of oil in comparison with the Eastern oil fields in the United States is yet to be determined, but it is a fact that our oil trade has already acquired a start and headway which will be exceedingly difficult for any obstacle to check.

The business of drilling wells and producing the crude oil, which is the part of the enterprise which requires the largest amount of capital, is in strong hands which completely control it. It is sure of success, for behind it there is more than sufficient capital to sustain it, provide all the improved tools, methods and appliances by means of which it can be most advantageously prosecuted and hurried on with most celerity.

The energy of the capitalists who control this interest is as noticeable in the improvement which they have effected in the quality of refined oil as it is in their work at the wells. In the case of each new oil field which has been discovered in this country, it has taken years to learn how to properly refine its product. California crude oil is slightly different in its composition from the oils of other fields, but the refiners who have handled it have made better time in modifying their processes in this instance than refiners ever have made before. The difficulties of refining this oil are fast being overcome. During the last year a palpable advance in this direction has been made, and we have assurances that the results just obtained from a long series of experiments, analyses and tests, made in conjunction with the regular work of refining, are most satisfactory.

One of the most important parts of the machinery for carrying on the trade has been greatly improved this year. This is the substitution of barrels for the cans and cases in which, up to the present time, nearly all refined oil has been packed. The barrels, which have reversible faucets, effect a saving of about three cents per gallon in the packing of oil, or \$120,000 on the whole quantity of oil packed and consumed on this coast during the year. The consumption on this coast during the year was 4,000,000 gallons.

Nine-tenths of all the oil used in the world today is the grade standard white, 110 deg. fire-test. The trade in California oil monopolizes the sale of this grade on the coast, and there is a surplus of it now in San Francisco. It supplies nearly all the western coast of Mexico, and is seeking the trade of the East Indies. Over and above supplying the demand in our own State, it has crept into the surrounding territories, and is pressing eastward toward the markets supplied by Eastern oil. Negotiations have already been made for large shipments to Japan and China, and this is spoken of as making an important stage in the development of the trade. The Asiatic trade is most coveted. Among the commercial men who have heard of these coming shipments there is a feeling of interest and appreciation, founded upon the widest fact, that the latter will tend to promote activity in other trades between this coast and these countries by providing increased shipping facilities. The prices here during the last six months have ruled only a trifle higher than the prices in New York. When San Francisco competes with New York for the Asiatic and East India markets, San Francisco is much the more desirable point to ship from, because the great difference in distance insures much to our benefit.

CALIFORNIANS AND NEVADIANS WANTED.—From a letter from Tombstone, Arizona, to the Candelaria True Fissure, we take the following paragraph: Nearly all of the mines here are controlled by Eastern men and Eastern capital. This is really a great detriment to the district, for there is more life and "git up and git" to one man from Nevada than there is in ten of these tenderfeet. This camp contains about 5,000 people; there are two daily papers and another will be issued in a few days. The best of board can be had here for eight dollars a week. There is much competition in all kinds of business, but everything is much cheaper than in Nevada. I would not advise any of the boys to come here for work. Everything in that line is greatly overdone. There are from three to five hundred idle men here; but it is no worse than other camps of its size elsewhere. Many of the boys from your locality are here. Some are working for wages and some are prospecting.

A SECTION of several hundred feet of the Dardanelles mining company's ditch, Placer county, slid away the other day, destroying some small reservoir in its course and necessitating the building of a flume for the conduct of the water.

THE Harshaw group of mines, in the Harshaw mining district, have been purchased by Dan Gillette and associates, of San Francisco, for \$200,000, and work on them will be at once commenced, under the personal supervision of Dan Gillette.

## MECHANICAL PROGRESS.

## Compound Portable Engines.

English manufacturers of agricultural machinery are devoting considerable attention to compound portable engines. At the recent Smithfield Club show three engines were exhibited, among others being one by Messrs. Garrett & Sons, of Leiston, of which *Engineering* gives the following details: The engine is of the intermediate receiver type, with cranks at right angles, and the cylinders, which are net steam jacketed, are respectively 7½ and 11½ inches in diameter, the stroke in both cases being 10 inches. The engine is rated by its makers as a 10-horse. The steam pressure used is 100 lbs. per square inch, and we are informed by Messrs. Garrett, that during a series of recent trials on the brake, the engine worked with as low a consumption as 22.8 lbs. of water per brake horse-power per hour, the load on the brake being at the time equal to 29-horse power, and the engine making 178 revolutions per minute. This trial lasted 2 hours, 4 minutes, and the consumption of Llangennech coal was at the rate of 3.17 lbs. per horse power per hour, the evaporation being 7.2 lbs. of water per lb. of coal, from a temperature of 110°.

This is a very excellent performance as far as the consumption of water is concerned, but the evaporative duty of the boiler is open to improvement. The engine has the valve chests on the outer side of the cylinders, and the slide valves are of the Trick pattern, giving a double-ported admission to the steam. For facilitating the starting of the engine, Messrs. Garrett have introduced the arrangement of stop valve. When in its extreme position to the right, the valve admits steam to the high-pressure cylinder, and places the exhaust of that cylinder in connection with the valve chest of the low-pressure cylinder. In its mid-position the valve partly throttles the steam admission to the high-pressure cylinder, but at the same time allows live steam to pass to the low-pressure cylinder, while the exhaust of the high-pressure cylinder, in place of passing to the low-pressure valve chest, passes to the low-pressure exhaust. In the extreme left-hand position the valve shuts off the steam from both cylinders.

**A NEW MATERIAL FOR RAILROAD BALLASTING.**—A new feature in railroad building has been started by the Chicago, Burlington & Quincy, in the manufacture of a new material for ballasting. It is formed of clay subjected to heat by bituminous coal. A small fire of bituminous Iowa coal is started on the surface of the ground, and when burning freely the fire is covered with a layer of lumpy clay, then alternately coal and clay, the coal decreasing in quantity until at the top it is as 1 to 15. The mass is formed like a cone. The clay appears to be impregnated with carbon, as it burns with a dull flame. Already three of these cones have been started near Red Oak, each 18 ft. high, the base of each touching the other. It is proposed to form them into one cone of large proportions, and let them burn all winter. The quantity of material in them is about 1,000 cubic yards. When cooled it is broken up and used for ballast. The manufacturers have a contract to ballast 600 miles of road with this material. When cold it resembles coal cinder, but it is much harder and of a reddish color. The process of manufacture is an English invention, which has recently been patented in this country.

**RAW HIDE COG WHEELS.**—A Wurdensburg inventor has recently exhibited some toothed gear wheels made of leather instead of metal, the advantages claimed for them being that they have a much quieter and more elastic run, are extremely durable and require no lubrication whatever. These gear wheels are prepared from raw buffalo hides, thoroughly cleaned from all hair, flesh, etc., and glued together in as many layers as are necessary to produce the breadth of wheel required. The cementing is, of course, effected under very heavy pressure, as in a hydraulic press, this being kept up until the glue has completely hardened. From the sheets or plates prepared according to the method described, the teeth are cut out, of uniform size and pattern, by saw and chisel.—*Exchange.*

**TESTS OF BOILER PLATE.**—It is now our intention to give, with our next number, if the engravings are finished, the result of a test which has never before been made in this country, relating to different tests of iron which have been in use. It will be complete and exhaustive, as well as furnishing some pretty hard arguments for the theoretical men who "oan tell all about iron by looking at it or thumping it with a hammer." Several more articles of this kind are now in course of preparation, which we shall publish first from the report furnished.

**REMARKABLE CASTING.**—The most novel exhibit shown at the Brussels National exhibition by the Serravallo Works is a certainly remarkable casting. It consists of what is practically the whole cast iron work of a marine engine, with a pair of cylinders about 28 inches in diameter by 20 inches stroke, cast in one piece—head plate, condenser, air, and feed, and bilge pumps, standards, cylinders and exhaust pipe.

## American Locomotives.

The United States exported 25 locomotives during the fiscal year of 1870, and 60 during the year 1880—an increase of 140%. Several monster locomotives for freight service are in process of construction for the New York, Pennsylvania and Ohio railroad. They rest on six drivers and a four-wheeled truck, and will weigh 38 tons, empty. Train men are considerably troubled by these trains breaking in two when hauled by these powerful consolidated engines, and the only remedy seems to be in equipping freight cars with heaviest drawbars, shackles, and pins.

The following from Mr. R. M. Broton, C. E., may be quoted as an authoritative English opinion of American built locomotives: "I argue that the greater duty done by the American motor is due to the better design and the better system of working the locomotives. The American builder excels in the system of framing and counterbalancing, and in the designs of crank axles, etc., so that the engine may run remarkably easy and without jar, round sharp curves, and work not only on the light roads, but also diminish the wear and tear on the solid roads, and at the same time increase the effective tractive force. The English engine is a very heavy affair, and in running it not only wears and tears itself very rapidly, but also the roadway, and it greatly, by its unsteadiness and jar, fatigues the drivers and firemen. I have ridden hundreds of miles on engines in India, in England, in France, and in the United States, and I have always found the American engine most easy and comfortable, but I never did the English or the Continental engines. It is almost impossible to give these engines their full hauling power, simply because the greater portion of the weight cannot be thrown off the driving wheels."

## Hose Pipe Nozzles.

Who is going to invent the nozzle of the future? There is no nozzle that we have ever seen that seems to us to control the stream it delivers as it should do. Instead of projecting a solid stream for a long distance, the water breaks soon after leaving the nozzle, and soon sprays and breaks up altogether. We often hear of steamers throwing 250 and 300 ft., but we recently heard a veteran chief say that he had yet to see the apparatus of any kind that would throw a solid stream 100 ft. The difficulty may be all with the water, which is naturally inclined to separate, but we are of the opinion that part of the trouble lies in the construction of the nozzle. An experiment made at Boston by putting a core into a play pipe, and thus dividing the stream into four parts, depriving it of its rotary motion, showed a gain of 30 ft. in distance playing. But even this does not seem sufficient. Our steamers give us power enough for throwing, and the hose in use gives every facility for carrying a large volume of water. There should be some means devised for delivering that volume in a solid stream at long distances. Great difficulty has been found in making nozzles operate uniformly at all times. A manufacturer of steamers once found a nozzle that gave him great satisfaction; with it his steamers could throw greater distances than any he had ever tried before. He ordered half a dozen just like it. The half a dozen were made precisely like the first, but never equalled it in delivering water. There is much to be learned yet regarding this question of delivering water on fire, and the exact relation existing between pressure, hose, play pipes, nozzles and the friction of water.—*Fireman's Journal.*

**HONORS TO SIR HENRY BESSEMER.**—The freedom of the city of London was lately conferred on Sir Henry Bessemer, F. R. S., at a special Court of Common Council. In acknowledging the honor thus conferred on him, Sir Henry Bessemer referred to the condition of the steel manufacture before the introduction of his process, and the rapid development of the industry which that process had caused. He compared the total steel production of the country, which did not exceed 51,000 tons a year, to the present output of nearly a million tons, and the reduction of price from £50 to £10 a ton. The document conveying freedom of the city was presented to Sir Henry Bessemer in a gold casket of very excellent design, appropriately illustrating his process. This casket was the production of Mr. J. W. Benson, of Ludgate Hill.

**A NEW METHOD OF PRESERVING WOOD.**—An improved French method of preserving wood by the application of lime is said to be found to work well. The plan is to pile the planks in a tank and to put over all a layer of quicklime, which is gradually slacked with water. Timber for mine requires about a week to be thoroughly impregnated, and other wood more or less time, according to its thickness. The material acquires remarkable consistence and hardness, it is stated, on being subjected to this simple process, and the assertion is made that it will never rot. Beechwood prepared in this way for hammer and other tools for iron works is found to acquire the hardness of oak, without parting with any of its well-known elasticity or toughness, and it also lasts longer.

## SCIENTIFIC PROGRESS.

## A New Theory of the Constitution of the Sun.

Some recent studies of solar spectra in connection with sun spots and other features of the sun's envelope have led Mr. Charles S. Hastings, of the Johns Hopkins University, to form a somewhat novel theory of the sun's constitution and the conditions producing the more notable phenomena familiar to solar students.

Mr. Hastings finds, contrary to the received opinion, that the spectra of the center and the outer edge of the sun's disk are not precisely alike, though the differences are so minute as to escape all but the most perfect instruments and all methods which do not place them in close juxtaposition. Certain of the Fraunhofer lines, thickest and darkest in the spectrum, notably those of hydrogen, magnesium and sodium, which appear with a haze on either side in the spectrum of the center of the solar disk, are sharp and distinct in the spectrum of the limb. Certain very fine lines are stronger at the limb, while other very fine lines are stronger at the center. The ordinarily accepted theory of the solar constitution and the origin of the Fraunhofer lines fails to explain these phenomena.

The probable reasons for this failure Mr. Hastings discusses at considerable length in the January issue of the *American Journal of Science*, and then proceeds to frame a theory of the sun's constitution, which, he thinks, will satisfactorily explain all the observed phenomena, and which may be briefly summarized as follows:

His theory differs from that of Faye chiefly in localizing the phenomena of precipitation instead of regarding it as proper to all portions of the photosphere, and in supposing the precipitation confined to one or two elements. He attributes the granular appearance of the solar surface to ascending currents directed generally from the center of the sun. About these currents are necessarily currents in an opposite direction, which serve to maintain a general equilibrium in the distribution of mass. The ascending currents start from a level where the temperature is probably above the vaporizing temperature of every substance. As they move upward the vapors are cooled, mainly by expansion, until a certain element (probably the carbon group) is precipitated. This precipitation, restricted from the nature of the action, forms the granules. The precipitated material rapidly cools, on account of its great radiating power, and forms a fog or smoke, which settles through the spaces between the granules till revolvatized below. It is this smoke which produces the general absorption at the sun's limb, and the "rice grain" structure of the photosphere. The reasons for supposing the precipitated element to be of the carbon group (carbon or silicon) is simply that no other substances present the properties indicated by the cloud masses of the photosphere. It is pretty clear that the substance has a boiling point above that of iron, for iron vapor at a lower temperature exists in its immediate neighborhood. The element is not a rare one, and its molecular weight cannot be great, for though precipitated below the upper natural limit of its vapor there are few elements found in abundance above it, and those in general of low vapor density. It is possible that the light coming from the sun is radiated from solid or liquid particles of carbon just at the point of vaporization; but Mr. Hastings is rather inclined to suspect that the photospheric material is silicon. There is also good reason to suppose he thinks, that carbon is precipitated at a higher level, possibly along with the less common element boron.

The clouds of carbon or other smoke would naturally be drifted into spaces of downward flowing currents, thus forming sun spots, the characteristics of which are readily accounted for by the necessary behavior of smoke clouds sinking into regions of higher temperature. This explanation of sun spots and their allied phenomena is certainly plausible, and we shall look with interest for what older students of the sun shall have to say about it.

**CHEMISTRY OF PLANTS.**—Dr. S. Ringer, who has for some time past been experimenting upon the physiological action of *Narcissus*, *Galanthus*, *Hemanthus*—genera belonging to the natural order *Amaryllidaceae*—has recently examined the properties of an alkaloid from the common garden tulip—a *Lilaceae* plant, and communicated his results to the *Practitioner*. It has been found by him that nitrate of tulipine differs almost entirely from the alkaloids derived from the amaryllids, it being a muscle poison which affects the muscles like veratrin, but to a less degree. These results are interesting from a botanical as well as a physiological standpoint, as going to confirm the theory that the relationships between natural orders may, to a certain extent, be indicated by the nature of their chemical constituents. The nearer relationship of the *Lilaceae* to the *Melanthaceae* seems shadowed forth by the fact that a *Lilaceae* plant has yielded an alkaloid like veratrin. In the same manner the position of the Australian genus *Duboisia*, as belonging to the *Solanaceae* rather than to the *Scrophulariaceae*, was demonstrated by the elimination of the alkaloid duboisine, and the discovery that its physiological action was analogous to that of solanaceous alkaloids.

## The Color Relation of Metals.

In a paper on the color relation of metals, and notably on those of copper, nickel, cobalt, iron, manganese and chromium, lately read before the Chemical Society, Mr. T. Bayley records some remarkable relations between solutions of these metals. It appears that iron, cobalt and copper form a natural color group, for, if solutions of their sulphates are mixed together in the proportions of twenty parts of copper, seven of iron and six of cobalt, the resulting liquid is free from color, but is gray and partially opaque. It follows from this that a mixture of any two of these elements is complementary to the third, if the above portions are maintained. Thus, a solution of cobalt (pink) is complementary to a mixture of iron and copper (bluish green), a solution of iron (yellow) to a mixture of copper and cobalt (violet), and a solution of copper (blue) to a mixture of iron and cobalt (red). But, as Mr. Bayley shows, a solution of copper is exactly complementary to the red reflection from copper, and a polished plate of this metal, viewed through a solution of copper salt of a certain thickness, is silver white. As a further consequence, it follows that a mixture of iron (seven parts) and cobalt (six parts) is identical in color with a plate of copper. The resemblance is so striking that a silver or platinum vessel covered to the proper depth with such a solution is indistinguishable from copper. There is a curious fact regarding nickel also worthy of attention. This metal forms solutions which can be exactly simulated by a mixture of iron and copper solutions; but this mixture contains more iron than that which is complementary to cobalt. Nickel solutions are almost complementary to cobalt solutions, but they transmit an excess of yellow light. Now, the atomic weight of nickel is very nearly the mean of the atomic weight of iron or copper, but it is a little lower—that is, nearer to iron. There is thus a perfect analogy between the atomic weights and the color properties in this case. This analogy is even more general, for Mr. Bayley states that in the case of iron, cobalt and copper, the mean wave length of the light absorbed is proportional to the atomic weight. The specific chromatic power of the metals varies, being least for copper. The specific chromatic power increases with the affinity of the metal for oxygen. Chromium forms three kinds of salts—pink salts, identical in color with the cobalt salts; blue salts, identical in color with copper salts; and green salts, complementary to the red salts. Manganese, in like manner, forms more than one kind of salt. The red salts of manganese are identical in color with the cobalt salts and with the red chromium salts. The salts of chromium and manganese, according to the author, are with difficulty attainable in a state of chromatic purity. He thinks these properties of the metals lead up to some very interesting considerations.

**THE ORIGIN OF THE DIAMOND.**—M. J. A. Roorda Smit has in the *Archives Néerlandaises des Sciences Exactes* a paper on the diamond mines of South Africa. He states that the diamond is found in a primitive gangue of volcanic origin, the presence of a double carboniferous silicate being a characteristic of these mines, which he regards as extinct craters of volcanoes. His hypothesis is that the diamond is of Plutonic origin formed at the expense of organic matter under the influence of great pressure, and at a high temperature. The recent artificial production of the diamond appears to confirm this view. M. Meunier states in the *Comptes Rendus* that he has produced crystals of spinel, and he believes periclase and corundum, by the action of steam on the chloride of aluminium in presence of magnesium at a red heat.

**PHOTOGRAPHING THE CHROMOSPHERE.**—Janssen has been induced, by his late novel experiments, to undertake photographs of the chromosphere. He allows the solar luminous action to continue so long that the solar image becomes positive to the very circumference, without going beyond it. The chromosphere is then shown in the form of a dark ring, with the thickness of 8" or 10". He has compared positive and negative solar photographs, which were obtained on the same day and with the same instrument; the measurement of the diameters shows that the dark ring in question is wholly outside of the solar disk.—*Comptes Rendus.*

**MACHINERY FOR WASHING AND SCOURING WOOL.**—This is an invention of combination of mechanism for dragging the wool from the washing contrivance up the incline to the squeezing rollers. One of the modifications consists of two sets of frames rammed with teeth, the rays of the teeth in one frame alternating with the rays of the teeth in the other frame, while another modification makes use of only one frame to drag up the wool, the other frame having a lifting movement to retain the wool. The frames are similar to a harrow in construction.

**MALLEABLE CAST-IRON.**—According to Mr. L. Forquignon, malleable cast-iron appears as an intermediate body between steel and gray pig-iron, from which it differs by the special nature of its amorphous graphite and by its great tenacity. It is distinguishable from steel by its slight extensibility and its large proportion of graphite.

at Panamint making arrangements for extensive work. A party well acquainted with matters there predicts that the Panamint will soon arise to something near its former glory and importance.

**FROM GOLD MOUNTAIN.**—Supt. I. M. Taylor, of the celebrated State Line mine, at Gold Mountain, lately spent several days in town. While here he purchased 4 miles of 4-inch water pipes and some 10 tons of grain, and also contracted with Sheriff Smith for 40,000 ft of lumber, or as much more as he can deliver.

## MARIPOSA.

**STRUCK IT.**—*Mariposa Gazette*, Feb. 5: We are reliably informed that James Dolan, who has charge of the Games vein, or Mexican mine, as it is called, some 4 or 5 miles above Hite's mine, has recently struck a 2-ft vein in the tunnel, which is said to be good and is exciting considerable interest. This mine belongs to Mr. Robert Williams, of this place, and it is banded to a company of New York capitalists. Mr. Williams has hattered away at this mine for several years, and spent considerable money in attempting to develop it. Our informant says: "This strike of a 2-ft ledge is the best thing that has happened to the county for years." Informant further says that the Ferguson mine is looking better than ever before, and is going to pay dividends from the start.

## MONO.

**BOULE.**—*Free Press*, Feb. 1: One hundred and twenty-four stamps are now thundering away on ore, and the new (Spaulding) mill will start up on Wednesday or Thursday next, the storm having delayed work. At least 90 more stamps could be readily supplied with good mill-ore. The Lent (Bodie and Mono Combination) shaft is down 415 ft, and is being sunk at the rate of fully 30 ft a week, which will send it 80 ft below the water level, and probably into the Fortuna vein of the Bodie and Mono mines by the end of next month. Several tons of machinery for this shaft was shipped from Carson on the 20th inst. The pump column and the 200 ft shaft are being lowered to the Cloud shaft. South Bulwer is still sinking. It is expected that Champion will begin sinking below the 580 level on Thursday next. Owing to the rich development in the winze from the 512 level of Noonday, it is in contemplation to begin the work of sinking the North Noonday-Noonday combination shaft at an early day. Boston Con. is cleaning out its sump preparatory to sinking to the 512 level to test, at that depth, the valuable vein followed for a distance of 310 ft in the 300 level. Syndicate is stopping an ample supply of ore for its 20-stamp mill from the old Geocela vein. Bodie tunnel is drifting north in flum ore in the Festoon (No. 20) vein, and will ship 100 tons to the Miners' mill next week, the object being to make a practical test of the ore before ordering a mill. Union Con. has cut through vein No. 2, which proves to be 12 ft wide, and gives assays averaging \$77.54 to the ton. The ore is of the Goodnow type. Goodnow is the winze from the 400, is milling much higher than was expected, and hence stoppage at that point has been resumed, having been temporarily suspended with the design of taking a better quality of ore from the south drift. The average pulp assays from Standard ore made an astonishing advance last week, running up to \$40.76, as against \$34.53 for the week ending Jan. 23d—an increase of \$15.13. The west crosscut, 1000 level, of Standard is in place, 37 ft, in rock of favorable appearance. The west crosscut, 982 level, of Tioja is in 75 ft, the increase in the flow of water from the face indicating the close proximity of the ledge. Bodie is quietly but steadily coming to the front again as the richest gold mine in the world, the quality of the ore extracted having steadily increased for the past 3 weeks. The yield of the ore milled last week was \$115 per ton, the average of pulp assays being \$54.50, and the difference between this and \$115, or \$60.44 per ton, being coarse gold saved in the batteries. As most of the ore milled is taken from the 0th or lower level, this showing is a most splendid one for the future of the mine. Concordia continues famously rich. The ore in the winze from the 512 level of Noonday gives assays up in the hundreds, and all the stops in Noonday and North Noonday are looking well. A wrong impression having gone out that many stops in this connection, that both the Noondays and the Concordia are entirely free from litigation, present or prospective, affecting the integrity of their respective surface claims or ore developments.

## NEVADA.

**THE HIRSCHMAN CLAIM.**—*Tri-Weekly Herald*, Feb. 5: We learn that J. W. Seibert, of New York, who last winter purchased the Hirschman gold diggings, which were sold lately at Sheriff's sale to satisfy a mortgage thereon, has arrived in San Francisco from the East, and will shortly visit this city and redeem said mortgage. Should he do so, work at the mine will soon be commenced.

**THE MICHEL PAN.**—*The Boston & Montana G. M. Co.*, of Helena, Montana, have purchased of J. Michel, of this city, one of his amalgamating pans.

**THE THOMAS MINE.**—The Thomas mine has been commenced to suspend operations on account of the want of fuel. The pumps were taken out a few days ago. The company will probably not open up again before spring.

**THE DERBEC MINE.**—*Nevada Transcript*, Feb. 4: Supt. De Nonn came down in a private conveyance yesterday morning with the last clean-up at the Derbec mine, which is said to have been a good one. It is reported he will be here to arrange for sinking an incline through which to work the mine hereafter. The work is now being done through a perpendicular shaft and is very expensive. The management are of the opinion that the incline would enable the production of a sufficiently large amount of pay dirt to make dividends possible at an early date.

**ALASKA.**—*Grass Valley Union*, Feb. 8: There is too much surface water at the Alaska mine, and work has been stopped. No time has been set for resuming operations.

**SEBASTOPOL.**—The Sebastopol shaft has filled with water, and no effort will be made to pump it out until it is certain that the worst of the rainy season is over. Just before shutting down the water raised in the shaft from 60 to 70 ft in a few hours, supposed to be the seepage from the old workings of the Redan mine, as the pump was considered to have capacity to take all of the surface water.

**CENTENNIAL.**—The Centennial mine has now 2 6-inch pumps at work, which are holding the water below the 300 level, and unless there should be a renewal of the heavy rains, work can be continued in the upper levels of the mine without interruption, and in due time the mine will be drained to the bottom.

The hauling of quartz to the custom mills has been entirely suspended, as the roads are so soft and deep in mud that hauling would be attended with too much labor and expense to justify the effort.

**ALPHA MINE.**—The little Alpha quartz mine has been having another good run, having cleaned up last week 130 ounces of amalgam as the product of the labor of 3 men and 2 boys for 3 weeks; the amalgam, when retorted, being worth the value of \$100. The product, load was about \$27.75. The mine continues to show the vein, which is about 2 ft in width, showing well in free gold and sulphurates. The level from which this rock was taken is the first, 120 ft in depth. It is the intention to sink for a new level after the rainy season is over. There has been no difficulty experienced thus far from surface water, which has been a source of trouble and detention to several mines in the district.

**IDAHO PRODUCT AND DIVIDEND.**—The bullion product of the Idaho mine for the month of January was \$66,000. The February dividend has been declared, payable immediately, of \$7.50 per share, amounting to \$23,550. This is the largest monthly product and dividend given by the mine in several years.

## PLUMAS.

**THE MONTE CRISTO.**—*Plumas Sentinel*, Feb. 5: Work is going on in good shape at this somewhat famous mine, and every day shows the gravel bed more plainly. A shaft recently put down from 1 of the drifts has passed through 3 ft of blue gravel, and still is not on bedrock. The main vein has encountered some heavy boulders, but with the aid of the big drill they are rapidly blown out of the way, and good progress is being made.

## SIERRA.

**SUSPENDED WORK.**—*Mountain Messenger*, Feb. 5: The Eureka Con. gravel company, Sierra City, has suspended work until spring, being unable to supply the mine through the deep snow, with provisions.

**SNOW 3 FT DEEP.**—Eureka. The miners have abundance of water, and are busy in their claims.

## NEVADA.

### WASHOE DISTRICT.

**C. & C. SHART.**—*Vincilia City Enterprise*, Feb. 6: The pump at the 2400 level is running and has been connected with the sinking pump at the bottom of the shaft.

**UNION SHAFT.**—The shaft has been sunk 10 ft during the week; placing bob in position at the 2300 level.

**UTAH.**—Since last report the east drift on the 1050 level has been advanced 26 ft, and the east drift on the 2150 level 25 ft; total length, 245 ft.

**MEXICAN.**—On the 2500 level the joint Ophir winze has been sunk and timbered 17 ft.

**ADAMS.**—During the past week the shaft has been sunk and timbered 30 ft; total depth below the 1550 level, 155 ft. The rock is growing harder. The shaft has been passing through ledge matter for the past 140 ft, carrying considerable base metal and giving low assays.

**UNION CON.**—Drill hole No. 9, from the bottom of winze No. 1, was extended 120 ft, the drillings assaying from a trace to \$15.

**CON. VIRGINIA.**—During the past week 102 tons of ore have been extracted and sent to the mill; assay value, \$15.53. Bullion in the office, \$10,308.32. On the 2300 level the south lateral drift has been extended 10 ft, the joint California east crosscut 17 ft, and west crosscut No. 1 6 ft.

**OPHIR.**—On the 2300 level the joint California winze has been sunk and timbered 17 ft. During the week, bullion to the value of \$5,175.02 has been shipped.

**ADAMS.**—On the 2300 level the shaft has been advanced 20 ft; total, 520 ft. On the 2500 level the north drift has been advanced 50 ft; total, 490 ft. The south drift on the 2400 and 2500 levels has been advanced 34 ft; total distance south of the winze, 103 ft. Ore raised during the week, 42 tons and 1,400 lbs, assaying from \$17 to \$60 per ton.

**CALIFORNIA.**—During the past week 153 tons of ore have been extracted and sent to the mill; assay value, \$13.53; bullion in the office, \$34,036.21. On the 2300 level the joint Ophir east winze has been sunk 17 ft, and the joint east Con. Virginia crosscut the same distance.

**SUTRO TUNNEL.**—Report of weekly progress of the Suto tunnel, ending Feb. 1, 1881: Main Tunnel—A shaft of timbermen was employed a portion of the week re-timbering near the Combination connection. The usual force was employed on general repairs along the main line. Flow of water in standard gallons, 3,351,000. North Lateral—The usual repairs were made to keep the drift in good order. South Lateral—Total number of ft from Julia connection 2,661. Nature of ground, heavy and swelling. Nature of rock, andesite with frequent clay seams. The nature of the ground run through during the last month proved to be of the worst character, and it was found impossible to keep the ground open with the ordinary method of timbering. On Jan. 25th work was discontinued at the header, and all the forces were employed in re-timbering, casing timbers and repairing the drift near the face. The ground is excavated 3 ft on the top and sides of the timbers, and false sets 10x12 inches put in. A portion of the bad ground has been re-timbered in this manner, and the new sets stand the pressure well. Other repairs were also made along the drift. At present some hot water is running from the face.

**YELLOW JACKET.**—During the past week we have extended the Suto tunnel level drift 50 ft, making the present length of the same 234 ft from the switch. The ground in this drift continues dry and full of clay seams, making it necessary to timber the drift and keep the same close to the face. During the first part of the week we were obliged to hoist water with our tanks for 70 hours, to assist the Belcher company to recover their 2160 level sump. On the 10th inst. received the center piece of one of the new flywheels, and are now employed getting the same into the building.

**A SINK HOLE IN THE COMBINATION.**—*Gold Hill News*, Feb. 5: Supt. Bawden reports that since Jan. 1st the water in the Julia incline has settled away 6 ft, and is now 02 ft below the point to which it originally raised. The decrease has taken away not only the water struck in Julia, but what was struck in the Bullion Combination shaft above the 1800 level, the flow of which was quite strong.

### CHERRY CREEK DISTRICT.

**MILL.**—*White Pine News*, Feb. 3: The Tipup mill building is up, and the machinery will be placed in position as fast as it arrives from the railroad.

**MR. MOSE SCRAMBLIN**, one of the best-known millmen in the district, and for several years in charge of the Star mill at this place, has severed his connection with that company.

The town for the past week has been quite dull, most of the idle men having gone into the hills at various occupations.

**BULLION SHIPMENTS.**—The Star company made the following bullion shipments, through Wells, Fargo & Co., during the past week: Jan. 28th, 2 bars, valued at \$1,350; Feb. 1st, 3 bars, valued at \$2,050; Feb. 3d, 2 bars, valued at \$1,300; total, \$4,700. The Exchange company shipped during the same period 2 bars, valued at \$3,000.

### EUREKA DISTRICT.

**THE GETTLOOF.**—*Sentinel*, Jan. 4: The general aspect of our mining business throughout the district never looked so prosperous and generally encouraging as at present. We do not expect a "boom," but we do look for very prosperous times here this spring and summer.

**CARSON CO.**—Work was commenced in the mine yesterday and will be prosecuted steadily. It consists of 4 claims on the west side of Cariboo hill, owned by Luther Clark and G. L. Scott. Small seams of ore running into the hundreds have been found on the property, and the owners naturally believe that better exist.

**THE MARYLAND TUNNEL.**—Work on the tunnel has been temporarily suspended, the management believing it good policy to await the development in some of the adjacent property. In the meantime they are prospecting some of their numerous claims.

**BAY STATE.**—Supt. Tom Robinson, of the Bay State, arrived from Newark valley yesterday. He reports that the machinery will soon be in position, and active operations resumed in the mine.

**THE BULLWHACKER.**—An average of 5 tons of ore are shipped from this mine to the reduction works daily. The amount would be larger but for the fact that 200 ft of the incline filled by chlorides is being cleaned out.

**EL DORADO.**—McDonald & Co. are prosecuting work on the above named mine with good success, and are taking out ore assaying as high as \$200 per ton. It is possible that the series of mines belonging to the gentlemen interested in this claim will change hands shortly.

**HAMBURG.**—No work will be done on the Hamburg before April 1st, when Supt. Powell anticipates that operations will be resumed. The Hamburg is considered to be an excellent property, and it should be thoroughly developed.

**A REDUCTION.**—Ten contracts have been closed in the Richmond mine, throwing 60 men temporarily out of employment. This course was necessary on account of the fact that the furnace on hand, the furnaces being unable to consume the supply.

**A FULL RUN.**—*Sentinel*, Feb. 5: Last week over 150 tons of ore were smelted at the reduction works of the Ruby-Dunderberg, and the furnace was kept running the entire week. There is no diminution to the ore output of the company's mine, a fact that will give satisfaction to those interested in the success of the camp.

### ESMERALDA DISTRICT.

**DEL MONTE.**—*Herald*, Feb. 5: After two weeks steady pumping and tanking, the heavy flow of water encountered in the excavation for tank station on 875 level has so far subsided that the pump now handles it without difficulty. Work was resumed in the excavation last night, and, as soon as the tank is put in, the plunger pump will

be placed in position at that point. During the past week the station on 800 level has been cut out and timbered, and the drift on that level is being pushed forward as rapidly as possible.

### GRANTSVILLE DISTRICT.

**CENTENNIAL.**—*Bonanza*, Feb. 5: Work is progressing as usual in the Centennial mine. The shaft has attained a depth of 45 ft, the bottom being in line looking ore. It is confidently expected that this property will develop into one of the finest in the district, and furnish sufficient ore this summer to justify the erection of a 20-stamp mill.

**THE ALEXANDER.**—The stopes in the Alexander mine are improving every day, and the whole mine is rapidly developing into one of the greatest wonders in the mining world.

**THE BROOKLYN.**—The late rich discovery in the Brooklyn continues to show more and better ore every day, with no signs of approach to the back of the ledge.

### LEWIS DISTRICT.

**RENNISS.**—*Cor. Silver State*, Feb. 4: The Starr & Groves mine and mill, at this place, are running pretty steadily and doing well, yet there is a gloom in the camp, and a dark cloud seems hovering over the Starr & Groves company, which some months ago took charge of the Starr & Groves property, reduced wages, and the reduction took effect today. Mill hands and miners' wages were reduced to \$3 per day, and \$8 a week for board. The wages of outdoor laborers were cut down to \$2.50 per day. There seems to be a disposition among the miners and others not to work at the reduced wages, and I am of the opinion that work will be suspended today. It certainly looks as if there will be a strike on account of the reduction, and if there is, the workmen will endeavor to prevent new comers from taking their places at the reduced wages. It is hoped that a compromise will be effected between the managers of the mine and the miners, and that their differences will be amicably settled.

### PIOCHE DISTRICT.

**R. & E. SHART.**—*Pioche Record*, Samuel Stoddard has been investigating the alleged caving of the main shaft of the Raymond & Ely mine, and found that no such cave had taken place near the main shaft, but between the 3d and 4th levels, 160 ft from the main shaft, a slight caving had taken place, which will require but little trouble to fix up.

**ATTACHMENT SUIT.**—An attachment suit was commenced against the Bristol mining company, on the 23rd of January, for \$13,377, by which all of the company's property was levied upon. We understand that the matter will be shortly arranged to the satisfaction of all concerned.

The chlorides working in the different mines around Pioche have a large quantity of ore on hand, and are only waiting for the export steamer to get to ship. Several others have been unfortunate in shipping to Dry Valley, as their ore has laid on the side-track, near the mill, ever since ice formed. The latter are waiting for a thaw.

### SPRING VALLEY DISTRICT.

**DEVELOPING.**—*Eureka Sentinel*, Feb. 3: Messrs. E. R. Rose and George Burgess are now developing the Woodchopper and performing assessment work on the Rose, Five-Twenty and Robinson. In the Woodchopper a body of high-grade ore has been uncovered, and when spring opens the mine is to be thoroughly prospected. In the Five-Twenty a quantity of ore was taken from a shaft short distance from the Woodchopper, and shipped to Austin, that yielded \$1,800 per ton. With such a record in the past, the present owners of the mine, Messrs. Duker, Rose and others, naturally believe there is a future for the camp.

### ARIZONA.

**GLOBE DISTRICT.**—*Chronicle*, Feb. 3: In the Gen. Hooker the face of the 165-ft tunnel is in ore averaging fully \$25 per ton.

**BULLION.**—The shaft on this property has reached a depth of 50 ft, and shows pay streaks on both walls. The hanging wall is 12 ft wide, and the one on the footwall 2 ft. At 55 ft the ledge was crossed, showing the vein to be 12 ft in width between excellent walls. The average value of ore thus far taken out is about \$40 per ton.

**WHITE STAR.**—This property has an open cut on the surface which penetrates the ledge, and some ore assaying \$170 per ton has already been taken from it. The mine is located on the 200 level, which is now down 20 ft, and shows a continuous body of good ore to the bottom.

**SILVER FAME.**—Work is progressing steadily on this property under the management of Messrs. Medler & Hayse. There has been about 30 tons of ore taken out, part of which was milled some time ago and yielded over \$600 per ton.

**GOLDEN EAGLE.**—The original shaft on this property is now at a depth of 270 ft. A tunnel has been sunk on the 100 level, running along the course of the vein, and is 700 ft. At this level there is a section 23x40 ft, in which is placed a whim, for the purpose of hoisting from the main shaft and 200 level. A winze has been sunk at a point 162 ft east of the shaft, and between the above-mentioned levels, which also shows a continuous ore body. This winze connects with the 200 level, and shows the width of the ore at this point to be 7 ft, and assays \$90 per ton. A winze has been started from the 200 level, which is now down 20 ft, and shows a continuous body of good ore to the bottom.

**MINERAL CREEK.**—We extract the following from a letter received a few days ago from Mineral Creek section: "The reduction works are now at the river, 5 miles distant from the mines, between which points we have an excellent road, down grade, from the mines to the mill site. The engine, boiler and concentrator are on the ground. By the 10th inst. it is expected that 100 men will be at work. As far as work has progressed, the mines are all that could be desired, particularly the Ray mine, which has a solid mass of high grade ore 9 ft in width."

**SILVER DISTRICT.**—*Phoenix Examiner*, Feb. 5: Work continues unabated on the Silent, the quarry showing a very even distribution of metal throughout the rock. Connection has been made between the south drift of the Emma shaft and the north drift of incline shaft, and a north drift is now being run from the 100 level of the Emma shaft, south, when stopping will commence, after driving some distance. The Rover, under Judge Ringwald, shows in the workings a heavy body of ore grading from 30 to 4,000 ounces silver to the ton.

The furnace runs like a youngster making water flow from a hydrant. Two hundred and twenty-three bars of bullion were shipped on the steamer of the 23rd inst. The net value of which was \$12,000, and the richest bullion ever run from a furnace in America, assaying from 1,000 to 1,425 ounces of silver to the ton.

**CAVE CREEK.**—*Phoenix Examiner*, Feb. 4: C. L. Hall, of Cave Creek, came in town Tuesday evening, and from him we learn that the proprietor of the Carbonate Chief have completed arrangements for the sinking of another 100 ft in addition to the 25 ft already sunk, and that claim was taken by Mr. Hall. He also informs us that Chas. Flemming has recently made a strike in a claim just above Wood's station.

**QUAGATE DISTRICT.**—Julius Bauerlein came in last night from a prospecting tour to the Quagate district, 24 miles south of Casa Grande, Final County, and this morning left with us on his way to the Quagate. He reports that the mine called the "Julius," which indicates a startling bonanza beneath. The specimens shown us are filled with silver blanza, antimony and horn silver, average assay of which run from \$300 to \$1,400, while select specimens go as high as \$3,000 and \$4,000 to the ton. Mr. B. informs us that the croppings are bold the full length of the claim, and a float assay all the way from \$120 to \$550. One hundred tons of this ore lies on the dump, and the ledge crops out boldly for a distance of 700 to 800 ft. The Way Up, recently sold by L. P. Nash to Lyons & Co., is having

an arastra erected upon it. This is a small ledge, though very rich, Nesh's Golden Wonder has a 2-ft vein of \$60 gold ore, upon which has been sunk a 90-ft shaft. Two arastras are kept in motion upon ore from this mine, and the yield is highly satisfactory. The Geocela, owned by Bacon & Co., has an 80-ft shaft upon a 12-inch vein of rock which assays about \$50. On the Zulu Smith, Gowan & Co. proprietors, is a 125-ft shaft in a 2-ft vein of ore which runs from \$40 to \$50 per ton. There is about 80 tons of ore on the dump, which is being slowly ground up with an arastra. Messrs. Kildley & Brown did not visit either the Gowan, American or Seiber & Smith's mine, considered to be by far the best properties in the district, but they were told the mines were improving as work progressed. It is also said, upon good authority, that a 10-stamp mill will shortly be erected upon the Gowan mine.

**GLOBE DISTRICT.**—*Silver Belt*, Feb. 2: Ore is being shipped from the California mine to the Champion mill, where 95% of the pulp assay is obtained. The Centennial is looking well. We understand that the working force will be increased. The Empress is now producing some very fine copper silver glance ore. This is found the entire length of the drift which has been run from the shaft, and is considered rich and of a favorable character. We had the pleasure of examining several specimens of Red Rover ore, and found it to be rich in horn sulphurates and red hematite silver. The latter is generally known as Mexican red silver, and is considered a very favorable indication. Capt. Sharp reports about 60 men at work at Richmond basin, in the Mack Morris and La Plata.

### COLORADO.

**STRIKE ON CASCADE CREEK.**—*Georgetown Courier*, Feb. 3: Last week a strike was made in the Silver Ring lode, on Cascade creek, of a 5-inch vein of ore from which an average sample assay returned 238 ounces of silver to the ton. The lode is an extension of the Musevite, and is opened by an adit on the lode 140 ft long.

**THE ARIZONA.**—Since the recently reported strike of rich decomposed ore on this lode the developments have been pushed with vigor and in a systematic manner. Work is now progressing on the lode at 4 different points, by two parties of lessees and two sets of contractors.

**THE STEVENS.**—We learn from Col. R. A. Pomroy, the agent of the Stevens mine, that about 4 tons of ore are being produced daily, and 3 car-loads are shipped to the smelting works at Golden each week. There are 20 men employed at the mine, the work at present being confined to drifting and stoping the 11th level, 134 ft below the tunnel level, where there is a fine vein of galena ore from 20 to 24 inches in thickness.

**DUMONT.**—Mr. Dubois tells us that in the Unadilla a fine body of ore has been found at the bottom of an old shaft, 65 ft deep, on the Eagle lode, owned by that company. The shaft was sunk about 15 years ago, and since then has been partly filled with water and debris, until last week when Mr. Dubois had it cleaned out, and was rewarded by finding a 10-inch vein of ore that assays \$91 per ton in gold and silver and 10% copper. The 20-stamp mill of the Mansfield Co. is treating about 2 cords per day of ore from the Monitor lode, owned by Messrs. Knabb & Green, which returns from 5 to 6 ounces of gold per cord. The Mansfield Co. is running a crosscut tunnel for the Milton lode, which is in about 150 ft, and also taking good quartz from that mine.

### MONTANA.

**BELL.**—*Helena Independent*, Feb. 5: The Bell mine, of Butte, is one of the coming bonanzas, and is attracting considerable attention and enlisting local capital in its development. There are three lodes on the principal location, one of which is remarkably rich in both silver and copper. Near the surface, where the ore has become decomposed and is free from sulphur, native silver is found in geodes of wonderful richness and unmixed with copper. The ore in the mine is pure copper sulphides and assays carrying 70% of copper and silver varying from 500 to 2,000 ounces per ton. The first-class ore is said to average 400 copper and 100 to 300 ounces silver per ton, and the second 25% copper and 20 to 40 ounces silver.

**THE ALTA MONTANA CO.**—As an indication of the extent of operations at Wickes, we note a contract for 7,500 cords of wood with Messrs. Murphy, Neil & Co. of this city; their contract houses have a capacity for 25,000 bushels of charcoal, and they will be filled as soon as the spring work is settled; their stock of lime rock is good for 3 months run, and J. O'Neill has contracted for a 6 months' supply; the quantity of iron ore now delivered at the works daily amounts to 30,000 lbs.

**THE IRON AGE.**—Of Beaver creek, owned by Sites, Fisher & Nelson, promises to "loom into notice" before long. An incline 125 ft deep connects with a level running 65 ft westward, and another 35 ft in an opposite direction. In the former level, it is claimed, there are 3 ft of first grade and 2 ft of second grade ore, and in the east level a still larger body, that continues to increase as progress is made in that direction.

**THE KATIE.**—Owned by Kleinschmidt & Bros., is making an unusually fine showing. The discovery shaft is 52 ft deep and timbered for permanent use, and a tunnel 12 ft in width of solid pay, and the ore is averaging approximately 31 ft wide. It is free milling ore like the Buster, also owned by Kleinschmidt. This lode is only 3 ft wide, but is sufficiently rich to make it profitable to work it. Out of a 30-ft shaft the proceeds of the ore milled paid all hemming and milling expenses.

**THE GREAT WESTERN IRON MINE.**—In the Basin district, Messrs. Conley & Calvin have found a monster iron lode, said to be over 12 ft in width of solid pay, and the outcrop stands exposed above the surrounding country for a distance of 30 ft. It carries about 60% of iron, and is of good quality for fluxing purposes.

### NEW MEXICO.

**BLACK RANGE.**—*Santa Fe New Mexican*, Feb. 2: From the southern country come the most astonishing reports of the finds in the Black Range. They are confirmed by responsible men, gentlemen from the south whose word is freely relied upon, having yesterday afternoon reported that there is the greatest excitement over the new discoveries, and that it is the richest mineral country known. Since Victorio's death the whole country has been resorted to by prospectors, and thousands of locations are being constantly made. The mountains are full of mineral, and every man who visits them become at once an enthusiast. It is confidently predicted that in the spring there will be a rush for the mountains and one of the greatest excitement known.

### UTAH.

**SILVER REEF.**—*Cor. Salt Lake Tribune*, Feb. 4: Last evening the 30-stamp company discharged every man at work in their mines, and 200 men are idle. The Barbee & Walker discharged half their force, and it is rumored, will close both mill and mine at the end of the month. The reasons given by both being high wages and low grade of ore. The question for the Miners' Union now is whether to accept the rate of wages paid in other camps or none at all. At this meeting of the Miners' Union has been called for this afternoon to discuss the situation. It becomes a serious question with them now where bread and butter is to come from. It is quite unlikely that the 2 mining companies will resume work at former rates of wages.

A CONTEMPORARY remarks that "the successful mines in Arizona are being worked by practical men." This, says the *Eureka Sentinel*, is one of the most common-place utterances that most any one will admit; yet it is persistently disregarded. Delving into the hard strata of the earth and opening up its richness is not the special work of visionaries and soft-handed, and too often soft-headed young men who have no fitness whatever for the management of an industry that requires a peoniar knowledge and rare executive ability.

### The Whaler's Work.

Although our efforts lie especially in making known the treasures which lie in the earth, it is not unfitting to turn the attention of readers for a moment to the treasures of the deep. California has a considerable whaling interest, and the outfitting of vessels calls for certain amounts of our food products. There is also an amount of money derived from the sales of oil and bone abroad, which is distributed here and tends to build up our prosperity on shore. Aside from the venturesome whalers who go to this far north in pursuit of their game, there is another whaling industry which operates along our shores, and in which the residents in the coast counties are more or less interested.

It may not be generally known, but at various points on our coast line, especially south of San Francisco, there are whaling stations where a good many whales are caught every year. There is one of these at Amesport, Pigeon point, New Year's point, Santa Cruz, Monterey, Carmel bay, San Luis Obispo, and at several other places. Generally the station is placed where there is high land where a good lookout is kept. The boats cruise in this offing in the daytime, and the signal man ashore on the elevation, by means of a kind of semaphore, indicates to the men in the boat where whales are to be seen. They pull in the direction indicated and harpoon the whales, towing them ashore and cutting them up. The stations, though picturesque looking at a distance, are not places one would choose for a visit. The carcass, after the blubber is stripped from it, is cut up, and the bones are saved and sent to this city to be burnt for manure.

In some places steam launches are used instead of whale boats. As a general thing, whale guns or bombs are used instead of harpoons. The whales pass on down the

to the upper jaw-bone, near *I*, at the end of the junk, near *J*, and at the root of the case, near *K*, and through these holes straps are rove, and lines are made fast to those of the junk and case. The second cutting-tackle is then hooked in the strap which is around the upper jaw at *I*; the fluke-chain is slackened off, and the first tackle fastened to the piece is lowered, when all hands have on the head-tackle, forcing the whale down again, and thus bringing the creature's head up, and the body nearly to a vertical position. The officers upon the cutting-stage, with their keen spades, cut away between the bones and junk from *L* to *C*, and the enormous weight of the whole fatty mass of this head hanging down opens this gash between it and the skull-bone; then, cutting cross the end of the junk and root of the case, from *E* to *F*, completes this process of cutting off the head, which is temporarily made fast to the ship's quarter. The fluke-chain is then hauled in again, and the blubber is rolled from this body in the same manner as that of a baleen whale, until coming to the region of the small, when it is unjointed just behind this vent, and the remaining posterior portion of the animal is hoisted on board in one mass. The head, as it is termed, is then hauled up to the gangway, and one of the tackles is hooked into the junk-strap at *J*, and by means of this cutting-tackle purchase, this head is taken in whole, if the whale is under 40 bbls.; but if over that size, it is raised sufficiently out of the water to cut the junk from the case, when it is hoisted on deck. The case is then secured by one or both tackles, hove up to this plank-sheer, and an opening is made at its root, of a suitable size to admit this case-bucket, when the oil is bailed out, or the whole case is hove in on deck before being opened; which finishes the cutting-in of a sperm whale.

The "head" or case oil is, when bailed out, as clear and limpid as water, but after a short time thickens and hardens into a mass as purely white as the newly fallen snow. The body oil is of a coarser nature. For all practical purposes, the

### Physical Studies of Lake Tahoe.—No. 7.

[Written for the Press by Prof. JOHN LE CONT.]

#### Colors of Sky and Water.

This consideration of the dichroic properties imparted by the presence of finely divided matter in a state of suspension, likewise harmonizes the views of the older physicists with the deductions from modern investigations. It was long ago insisted that there existed a complete analogy between the tints of the sky and those of the purest natural waters; indeed, that the causes of this blue color of the sky and the red tints of sunrise and sunset were identical with those of the pure natural waters under corresponding circumstances. In other terms that, in both cases, the blue tints are due to reflection and the red to transmission. In relation to this sky, these have been long recognized as the true causes of its variable tints. Now we have shown that the light transmitted by a column of natural water is in reality "yellow, orange, or red, like the light of sunrise or sunset," while the light reflected from the attenuated suspended particles partakes of the various shades of blue, like the hues of the sky. Hence the analogy is completely verified upon the same basis of experiment. Moreover, the thermotic researches of Prof. Tyndall and others, seem to demonstrate that liquids which possess absorbing qualities for radiant heat preserve these properties in the gaseous or vaporous state. In other words, when a liquid assumes the vaporous state its power of absorbing heat rays follows it in its change of physical condition. Hence, it appears that the absorption of the thermal rays seems to depend upon the individual molecules of the compound, and not upon their state of aggregation; for the change into vapor does not alter their relative powers of absorption. This power asserts itself correspondingly in the liquid and in the gaseous states. Now, although we have as yet no direct experimental evidence in regard to the relative pow-

er of reflection back to the observer more or less of the transmitted light must, evidently, modify the resultant tint presented to the eye. According as the bottom exhibits various shades of white, green, yellow or red, the mingling of these tints with the blue reflected from the suspended particles in the intervening stratum of water, must give rise to various chromatic hues, from bluish-green to yellowish red.

There is much uncertainty in relation to the origin of this color-designation of the Red sea; but it is by no means improbable that it arose from the abundance of red coral found in it, which imparts a reddish tint to the waters occupying the shallow portions. The waters of the Bay of Loango, on the western coast of tropical Africa, have been observed to be always strongly reddish, as if mixed with blood, and Captain Tuckey assures us that the bottom of this bay is very red.

(c) It is scarcely necessary to remark that as the tint of this light coming from the bottom to the observer is modified by the thickness of the intervening stratum of liquid—the color due to the mingling of it with the blue reflected from the suspended particles must depend, to some extent, upon the depth of water as well as the hue of the bottom. (d) Lastly it is very obvious that the amount and character of the suspended matter existing in this water, must, more or less, modify the color presented to the observer. Near the mouths of rivers the sea exhibits tints evidently depending upon the color of the suspended materials discharged into it. Thus, the Yellow sea derives its name from the hue imparted to its waters by the large amount of yellow sediments discharged into it by the Hoang-Ho and Yang-tse-Kiang. Moreover, the variety of colors of the waters of the seas may, in many instances, be traced to myriads of living vegetable and animal organisms diffused in the liquid. The unfortunate Captain Tuckey, while navigating the sea on the western coast of tropical Africa, found that the waters began to grow white on entering the

DIAGRAM SHOWING THE DIVISIONS OF THE WHALE MADE BY THE WHALERS WHEN "CUTTING IN,"

oast at certain seasons of the year, and are generally at pretty regular distance from the shore. This is the only place in the world, we believe, that this sort of whaling is carried on. It is usually necessary to employ vessels to go down "on the line," or "on Japan," or among the South Pacific groups, or up to the Arctic. This port is a place of rendezvous for the Arctic and South Pacific whaling fleet. Every winter a couple of dozen whaling vessels are laid up in Alameda creek in front of Oakland. The coast whaling traffic is pretty extensive, and gives employment to several hundred men, but it is difficult to get at the exact production. The Arctic fleet brought back last year 22,278 bbls. of whale oil, 284,700 lbs. of bone and 14,850 lbs. of ivory.

The methods of the whalers are full of interest, and volumes have been written upon the history and achievements of their industry. We introduce at this time an engraving and description illustrative of the manner in which the monsters are disposed of. Our authority is Scammon's "Marine Mammalia."

"The first procedure after the animal is fastened to the ship, is to cut a hole through the hubber, between the eye and fin, at *A*, as seen in the accompanying outline sketch, then, after cutting the scarfs on each side and around this end of the first blanket-piece, a hubber-hook, attached to one of the cutting-tackles, is inserted into this hole at *A*, and the piece raised by means of the tackle until the whale is rolled on its side; then the line of separation between the upper jaw and junk is cut, as from *L* to *C*, and if a large whale, the line of separation is cut between the junk and case, as from *B* to *E*, and a cut is made across the root of the case from *E* to *F*; a scarf is also made around the root of the lower jaw, from near the corner of the mouth, *G*. A chain-strap is then put on the jaw near *H*, and hooked or shackled to the second cutting-tackle, and raised by that purchase, while the other tackle attached to the piece is slackened off, if need be, so as to let the whale roll upon its back; when, by means of the tackle attached, and by cutting away this tongue and the adhering flesh, the jaw is wrenched from its socket and placed on deck. This being accomplished, the first tackle, which is attached to the piece, is hove up by means of the windlass, until the whale is rolled over to its opposite side, when the lines of separation are cut to correspond to those made opposite. Holes are then mortised through the head close

to the general principles of "cutting-in" the sperm whale will apply to the same process in regard to the right or bone whale; and for a thorough description of these cetaceans, the implements used in their capture, and the saving of the oil, the work quoted above will be found an excellent authority.

**CALIFORNIA HARBORS AND RIVERS.**—The River and Harbor bill has been substantially completed by the House Committee on Commerce. California items in the bill, as it now stands, are as follows: For continuing the improvement of Oakland harbor, \$60,000; for Wilmington harbor, \$12,000; Sacramento river, \$30,000; San Joaquin river, \$20,000. The amount for the improvement of Petaluma creek has not yet been fixed, but will be about \$10,000. The amount for Oakland harbor would have been larger were it not that about \$150,000 of the former appropriation still remains unexpended. The committee has cut down the engineer's estimate for all river and harbor improvements throughout the country, on an average to half, and in some instances to one-fourth.

**EXPLOSION IN A MINE.**—Henry Minear has commenced suit in the Superior Court against the Mount Jackson quicksilver mining company and James A. Meade, its President, to recover \$15,000 damages for personal injuries sustained Nov. 20, 1880, at the mine, near Guerneville, Sonoma county, by reason of being ordered by defendant, the President, to go into the south drift and perform some work, which necessitated the use of a light. This complaint alleges that while performing this work ordered, gases that had oozed out of the earth and filled the interior of the drift took fire and exploded, killing a Chinaman who was assisting plaintiff, and injuring plaintiff's eyesight, and causing other severe injuries.

The following companies have been dropped from the list of the Boston Mining Exchange: Arnold, Belcher, Bodie, California, Con. Virginia, Chrysolite, Eureka Con., Grand Prize, Hukill, Mexican, Northern Belle, Ophir, Sierra Nevada and Union Con.

ONE of the iron steamers contracted for by the Oregon Steam Navigation Company was launched last week at Chester, Pa. She is 312 ft. in length, 39 ft. beam and registers 2,630 tons. She will be known as *Williamette*.

ers of absorption of various vapors for the different luminous rays; yet these thermotic results render it analogically probable that vapors carry with them the same relative absorbing powers for the different rays of light which their liquids enjoyed. Hence we may conclude that if the mixture of air and aqueous vapor constituting our atmosphere were perfectly free from suspended particles (ultra-microscopic globules of water no less than solid corpuscles) it would probably, like distilled water, absorb more copiously the rays forming the red end of the solar spectrum than those of the blue extremity, so that the green-blue tints would appear by transmitted light. But, as in the case of natural waters, the presence of finely-divided matter in a state of suspension in the atmosphere, by scattering the shorter waves of light, neutralizes and overcomes the effect of selective molecular absorption; so that, in reality, yellow, orange and red are the tints transmitted at sunrise and sunset, while the light reflected from the attenuated suspended particles gives us the blue color of the sky. It thus appears to be in this highest degree probable that the dichromatic properties of the atmosphere are due to the same principal causes as those of the waters of lakes and seas.

#### Cause of Other Colors of Certain Waters.

Besides the rich blue and green tints which we have been considering, the waters of lakes and seas, in some places, present various other hues. From the preceding discussion it is evident that the shades of color, presented to the observer, will depend upon several circumstances, viz: (a) the presence of coloring matters in solution; (b) the color of the bottom; (c) the depth of the water, and (d) the amount and character of the suspended matters present. (a) There are certain natural waters which obviously derive their colors from the presence of coloring substances in solution. In most cases various organic matters seem to be coloring agents. Thus the waters of pools, ponds and small lakes, as well as those of their tributaries, in certain level forest-clad regions, frequently exhibit various shades of brown, and sometimes present a rich cherry color when viewed in considerable masses. These tints, doubtless, arise from the diluted colored infusions produced by the percolation of the meteoric waters through decaying leaves and other organic substances. (b) The color of the bottom, when the water is sufficiently shallow to

Gulf of Guinea, and in the vicinity of Prince's island, his vessel appeared to be moving in a sea of milk. He ascribed this white color of the water to the multitude of minute animals, (many of them phosphorescent), diffused near the surface, which completely masked the natural tint of the liquid. In like manner according to the observations of Captain Scoresby, the olive green waters of certain portions of the Arctic seas, owe their color to the presence of myriads of medusae and other animalcules.

**MINING ACCIDENTS.**—Every trade is subject to its peculiar line of accidents. Thus the carpenter is liable to split his great toe with a broad ax or chip off his kneecap with an adze; the blacksmith is exposed to burns and bruises, the stonemason to falls and spawls of rock in the eye; the sailor to falls and death by drowning, but the miner is exposed not only to the accidents of his own trade but also those incident to all others. He may be drowned, like the sailor; killed by an explosion of gunpowder, like the soldier; burned to death, like a martyr at the stake; scalded in hot water, crushed by falling rocks and caves of earth, wound up in machinery, ground under the wheels of a grapple, have his head split open with an ax in timbering, his legs and arms broken by falling through floors, his neck being dislocated by being run up into the shaves, his head broken off by falling from a cage, and his whole body knocked out of human shape and reduced to a pulp or scattered in shreds by falling down a shaft. Also, in falling down a shaft, particularly through the pump compartment, there are so many projecting points and sharp corners of iron that he may suffer all the cuttings and rendings incident to any or all the trades of the world. In other trades, we may calculate and to a considerable extent guard against the accidents that are liable to happen, but in mining accidents are constantly happening, the like of which was never before heard of. The miner is exposed to the accidents common to the use of tools of various kinds, falls and falling things, fire, floods, explosions, suffocating gases, scalding water and to machinery of various kinds moving in all directions.—*Virginia Enterprise*.

This San Francisco Branch Mint coined in January, \$1,870,000 in gold, and \$1,000,000 in silver. Total, \$2,870,000.

## Tarrytown Mining District.

## A Mineral Region Scarcely Prospected.

From a letter to the *Bodie Free Press*, we take the following items of the above named Inyo county camp: Tarrytown district is situated on the eastern slope of the White mountains, about 4½ miles east of the Mono line, in Inyo county, California, and about 6 miles west of Deep Spring valley. This district was organized some time in November last, and S. P. Roberts was elected Recorder. Now, it is not the intention of the writer to "blow up" this country, but to give readers a few simple facts in regard to the mineral resources, the advantages of reducing ores, etc.

The mineral belt is some six and a half miles in length by about one and a half miles in width. The formation is lime and salt, the veins or lodes running in a northerly and southerly course and dip west. The ores are what is known as argentiferous galena or lead ores, free from any rebellious metals. Having had some 15 years' experience in handling and working this kind of ore, and having passed the last eight months in this camp, I give the following: There was a great

## Many Locations Made Last Season.

And not one hint shows large quantities of ore. Seventy-four assays out of as many locations average as follows: Silver, \$52.80; gold, \$5.30, and 48% lead per ton. Most of these assays were made at the Standard office. There are five claims that have been worked, which I never saw equalled for the amount of work done. The Heritage mine, owned by Mr. Barry, has done considerable work. A tunnel cuts the vein some 10 ft. from the surface, where the ledge is three and a half ft. wide and assays \$124.55 in silver, \$15.60 in gold and 25% in lead. A large quantity of this ore is on the dump. Mr. Barry also owns a claim called the Alta, a two and a half ft. vein of high grade ore, some 75 to 80 tons of which is on the dump. There is one mine which has an incline shaft down 95 ft. on the ledge, showing a well defined vein from three to four and a half ft. of solid metal from the surface to the bottom of the shaft, between the walls, which are slate foot-wall and lime hanging-wall. One level was run 33 ft. in ore, the average assays being \$81.24 in silver, \$8.50 in gold and 51% lead. This mine, with 20 men at work, will keep a furnace of 20 tons capacity in full blast night and day. There is something like 300 tons of this ore out. A six-mule team can be driven to the mine. Just above, some 200 yards, is another valuable property, which has been sunk on in different places, showing a well defined vein from 3½ to 4 ft. of carbonate and chloride ore of high grade, assaying \$121.40 in silver, \$15.12 in gold and 52% lead. There are several places on the line of the lode showing a ledge of nearly solid metal six ft. between the walls. This mine alone is capable of keeping a 40-ton furnace running, with 20 men at the mine. A large quantity of ore has been extracted from this claim. There is still another claim, supposed to be the extension, showing a well defined ledge 1½ to 3 ft. wide of solid metal. The shaft on this claim is down 60 ft., showing three ft. of fine mineral at the bottom, which assays \$71.20 in silver, \$6.18 in gold and 45% lead. This also has a large quantity of ore out. There are many other fine properties I could speak of, and which I may have occasion to mention soon.

## Water and Timber.

Within 200 yards of the mines I have spoken of is a flat and grassy area of about 100 acres. At the head of this is a valuable spring, which pours out not less than 50 inches of water during the driest seasons. This spring forms what is known as Wyman creek, which empties into Deep Spring valley. There is also another spring some 100 yards from the mines, which runs some eight inches. There is not less than 10,000 acres of fine tamarack timber, not more than three miles from the mines, with a good natural road into the same. This timber will make good lumber. There are also thousands of acres of nut-pine timber, the finest I ever saw, lower down and near the mines, which makes the best of coal, and which can be made cheaper than in any other county on the Pacific coast. These mines and the facilities for working excell those of Eureka, Nevada, or any galena camp in Utah for the amount of work done. This is my simple opinion of them, and the country is open for any one to examine.

**THE CHLORINATION PROCESS PATENT.**—The case of G. F. Deitken, the well-known and accomplished Grass Valley metallurgist, against the Providence Gold and Silver Mining Co., is on trial before a jury in the U. S. Circuit Court. The plaintiff claims that in July, 1863, he obtained letters patent for an improved apparatus for the extraction of gold from pyrites by the use of chlorine gas, and that he has ever since been the owner and has had exclusive right to the use of the invention in all parts of the United States, excepting Amador county, Cal.; that in July, 1872, and prior and subsequent to that time, the corporation defendant, in the county of Nevada, Cal., used the improved apparatus, in violation and infringement of plaintiff's rights, to his actual damage in the sum of \$10,000. Plaintiff seeks to recover such actual damages and a further sum, not exceeding three times the amount of the actual loss sustained, as allowed by statute. Defendants interpose a general denial.

## USEFUL INFORMATION.

## How Handles are Made.

Very little has ever been written or published relating to this industry. Nevertheless it has taken wonderful strides and grown to mammoth proportions during the past decade. More than \$5,000,000 worth of handles and other commodities manufactured in direct connection with this industry, are turned out every year. When we come to consider that every house, store, manufactory, and barn in this broad land has from five to twenty handles in every day use, we will not be surprised, or think the above figures overdrawn. It is our intention, however, to confine ourselves more especially to the manufacture of implement handles in this article.

In the first place, it is essential that the manufactory should be situated in a locality where can be found an abundance of white ash, birch, or maple timber. The logs are cut in bolts of from four to twenty feet long, according to the length of the handle to be made; then drawn to the factory and sawed into planks. Here, great care must be exercised to saw the timber with particular reference to the grain. Only sawyers of years of experience and adepts in their particular line should be employed. The durability and value of the handle depend largely upon the first sawing.

The planks are sawed, cut off, made of a uniform length, and taken to the lathe to be turned. But a few years ago, a bundled finished handles was considered an unusually good day's work for a single man—to-day, one man with a gauge lathe, is capable of turning out from seven to 1,200 per diem, according to the length and shape of the handles. The handles are next taken to the chinking machine, where the top end is rounded and chucked; the bottom is at the same time seized or chucked to fit the ferrule. This is rapidly done, one man being able to chuck half a carload per day. It should be remembered that the handles are all turned while the timber is yet green. After the chucking process, they are transferred to the dry kiln to be seasoned. If the handles are to be bent, they are steamed and placed in forms to cool, after which they are taken to the finishing room and polished on sand belts.—*Industrial World*.

**PARAFFINE AS A WOOD PRESERVER.**—A German chemist, Dr. Sebal, has established the useful fact that wood impregnated with paraffine is preserved from rot, especially when employed in alizarine manufactures, where it is exposed to the decaying action of damp, acid, and alkaline lyes. Wooden vessels which become totally rotten in two months, last for two years when impregnated with paraffine. The preparation of the wood is effected by drying it in warm air for three weeks, then steeped in melted paraffine to which has been added some petroleum ether or sulphuret of carbon. In preparing this bath great care must, however, be exercised, owing to the inflammability of its ingredients. To prevent the paraffine from escaping from the pores, the wood should be coated with oil varnish or soluble glass, washed after drying with diluted hydrochloric acid. The silicic acid thus formed clogs up the pores from the outside, and protects the paraffine from the action of water. Paraffine, melted with equal parts of linseed or rapeseed oil, is also, according to Dr. Sebal, useful for coating iron vessels, which in chemical manufactories are otherwise very liable to rust.

**HARD SOAP BY A COLD PROCESS.**—Mr. R. F. Fairthorn, Ph. D., has contributed the following recipe to the *Druggists Circular*: A good hard soap can be easily produced if four lbs. of olive or sweet almond oil mixed with two lbs. of soda lye, of the strength of 36° Baume, are stirred until of the consistence of thick paste, when it should be poured into molds, covered by several folds of muslin and kept in a warm room for 20 hours. By this treatment the process of saponification, or union of the acids in the oils with the alkali, is complete. When these materials are first mixed the temperature of the mass rises, and in order to effect the entire union of ingredients so as to form the compound called soap, it is necessary that the heat thus generated should be maintained for some time, hence the necessity for covering the molds and keeping them in a warm room. He has found that it is desirable to use oil that is slightly rancid, or, if free from rancidity, to add about 10% of oil that has become so. Oil that is perfectly sweet requires two or three days to effect saponification.

**A VARNISH** of cement, which goes by the name of Chinese varnish, and renders card-board or thick paper as hard and hoarse as papier mache, is easily prepared from blood, lime, and alum. Three parts of fresh blood, well beaten up to prevent the formation of fiber, is mixed with four parts of slacked lime, and a little alum, the thick-flowing mixture that results being at once ready for application to paper or card.

**TREATMENT OF OLD CARRIAGES.**—Previous to repainting or revarnishing old carriages it is necessary first to wash clean and rub down the surface with a wet cloth and ground pumice powder until it appears quite dead, or without gloss. After a second washing and drying with wash leather it is ready to receive paint or varnish.

**TO PREVENT CLOUDING OF MIRRORS BY MOISTURE.**—A writer in the *Manufacturer and Builder* says that by coating over the surface of glass mirrors with glycerine their clouding by the accumulation of condensed water vapor will be prevented for a considerable time. The attraction of the glycerine is so great for the water as to absorb the latter as fast as deposited. This hint may prove of great use to dentists, who are frequently troubled by the clouding of mouth-mirrors, and it may also be of value to those who are compelled to shave themselves in chilly apartments.

An invention which will considerably influence architecture and sculpture has recently been made by Dr. Gehring, at Landshtut, in Bavaria. Dr. Gehring, by means of an emulating liquid, is said to render any kind of stone or cement harder than granite, and gives it the absolute and indelible appearance of any other mineral desired. The enamel may also be applied to metal, which it is said to completely protect from rust.

## GOOD HEALTH.

## Glycerine for Acidity of the Stomach.

A late number of the *Boston Journal of Chemistry* reprinted from the *London Lancet* Dr. Ringer's article upon the use of glycerine in flatulence, acidity and pyrosis. Dr. J. A. Lewis, referring to the same article, in a communication to the *Louisville Medical News*, says:

"I desire to add my testimony to its value, so far as regards acidity and flatulence. For this form of indigestion, so common, and for the relief of which so many persons resort to the daily use of soda, glycerine is a remedial agent of no mean value. I have used it for several months with my patients troubled in this way, and in a majority of cases the results have been gratifying.

I had no knowledge of its use for dyspeptic troubles, and was led to the use of it much in the same way as reported by Mr. Ringer. I knew of its property of preventing fermentation, and especially of its use by druggists in preserving their syrups from acidity. I was led to a trial of it upon this principle, and soon became satisfied of its real value. I have always prescribed it in large doses, never less than two teaspoonfuls to a tablespoonful for an adult, to be taken in a wine glass of water immediately after eating. It does no good after fermentation of the food has taken place in the stomach.

It is no specific, no cure-all, but certainly does afford alleviation, if not a cure, in many of these cases, and is worthy of a place among the remedies in use for this very common ill of the flesh.

**SICK HEADACHE.**—This complaint is the result of eating too much and exercising too little. Nine times in ten the cause is in the fact that the stomach was not able to digest the food last introduced into it, either from its having been unsuitable, or excessive in quantity. A diet of bread and butter, with ripe fruit or berries, with moderate and continuous exercise in the open air sufficient to keep up a gentle perspiration, would cure almost every case in a short time. Two teaspoonfuls of powdered charcoal in a half-glass of water, and drank, often gives instant relief. Sick headache with some persons comes on at regular intervals, and is a signal of distress which the stomach puts out to inform us that there is an over-alkaline condition of its fluids; that it needs a natural acid to restore the battery to its normal working condition. When the first symptoms of headache appear, take a teaspoonful of lemon juice clear, fifteen minutes before each meal, and the same dose at bedtime. Follow this up until all symptoms are past, taking no other remedies, and you will soon be able to go free from this unwelcome nuisance. Many will object to this because the remedy is too simple; but many cures have been effected in this way.

**DANGER IN THE SLEEPING-ROOM.**—In fighting that terrible enemy, sewer gas, it will not do to depend on the plumber. In sleeping-rooms the syphonage of the trap is the opening of the gate of death; and yet, strange to say, thousands of people hear nightly this death-rattle in their rooms, and do not know what it means. Now, if one can't have effective plumbing, the next best thing is to know what to do about it. As syphonage implies the breaking of the water-seal that acts as a barrier against the free admission of sewer gas, it is, first of all, important to know what traps are defective. When one hears a low, gurgling sound in the wash-basin, the time for action has come. Any noise beneath the wash-basin, at any hour of the day or night, when the water is not turned on, means death. The gurgling sound is caused by a draft of air down the escape-pipe, which breaks the water-seal. Of course the services of the best plumber should be had at once; but in the meantime fight the enemy. First turn on water and fill the trap. Then put in the plug, fill the basin half full of water, and with wax or soap seal up the overflow holes. Lower a window and let in the outer air. Until the sound of syphonage ceases, and you are absolutely certain that the trap can be relied on, stand guard over it. Keep the overflow holes sealed and the plug in, no matter at what risk of flooding lower rooms, in case some one is

thoughtless enough to leave water turned on. If every family would act on these hints we would have less diphtheria.

## Should a Baby be Fat?

While there is a measure of truth in the assertion that fat babies are not necessarily healthy, the following much quoted extract from a physician's letter to a Boston paper is likely to do mischief by its extravagant condemnation of fat. Speaking of fatty degeneration the physician says:

"Many infants do become thus diseased before they are three months old. This stops the growth and leaves the poor deceived parents nobbling but increase in weight to boast of; and when the poor little victim to his own greed and his parents' folly gets to the end of his tether he melts away like butter in a hot oven, and then it is seen how poor (in flesh) he has been all the time. Few comprehend the broad difference between flesh and fat. The first is lean meat—muscle—the result of growth; while fat—I don't care how hard and solid it may be—is the product or accumulation of unexcreted excess. This is why no one bets a dollar on a fat horse or a fat man—they are 'soft' and 'can't stay.' It is every whit as true of a fat baby. The only wonder is that any infant lives sixty days from birth. Fed before birth but three times a day, he is after birth subjected to 10 or 20 meals in 24 hours. Before birth he grows at the rate of about 10 pounds per year, after birth he is permitted to fat at the rate of 50 pounds per year until chronic dyspepsia or some acute disease interferes. Feed of a kitten, calf, colt, or a young robin—they are, and remain while growing, but little more than skin and bones and fur or feathers, because unable to get enough to fatten them, and they never die—rarely have any disease. Children are never fairly 'out of the woods' until they reach the lean age and have pipe-stem legs and arms, with no rolls of fatty tissue anywhere about them. Could they be kept so from birth and not permitted to over-indulge, so that their appetites would always be reliable for plain food, they would have no infantile diseases to enrich our pockets."

Why should the kitten, the colt, or the young robin be taken as a model of infantile health, rather than the puppy, the bear cub, the pig, or the young pigeon?

It is the nature of some young animals to be lean and healthy; of others to be fat and healthy; and there is as marked a difference in the natural tendency of young children. Infants of the same parentage and fed at the same breast will differ in this respect, and both be healthy. Fat laid on at the rate of "50 pounds a year" is quite another matter, and one not liable, we take it, to be a common cause of anxiety. Injudicious feeding is more apt to show itself in lack of fat, and lack of proper muscular tissue as well. That sort of leanness is much too common in young humanity.—*Scientific American*.

**LEARN TO SLEEP.**—The true art of sleeping is the power to shut one's self within one's self under any circumstances. The man who can thus take rest is refreshed and strengthened under many circumstances which would keep other people weary and wakeful. He is master of every situation as regards his own rest. Some men, by long habit, find themselves able to take sleep with the same ease that others would take a glass of water. They can sleep either while perched on a high stool or rattling along in a railroad car at 40 miles an hour. The economy of wear and tear on the lives of such people is wonderful. The man who cannot sleep unless he has first removed his clothes, put out the light and climbed into his bed is at a great disadvantage. Greater yet is his disadvantage if he can sleep in no bed but his own. There are some who are possessed with the notion that their own bed is the only one in which they can slumber. These people are utterly wretched when traveling, or obliged to absent themselves from home on business. But he who has accustomed himself to sleep, can enjoy that boon at any time or place, and is made better and happier thereby.

**WORMWOOD AS AN INSECTIFUGE.**—In a communication to the French Academy (*Comptes Rendus*, p. 607), M. Poitrot attributes to the wormwood (*Artemisia absinthium*) extraordinary properties as an insectifuge. He states that among the plants of this species that cover the vast plains of North America, he has never seen flies, ants, or any other kinds of insects; and to these he adds worms, scorpions, rattlesnakes, and other serpents. He proposes to use this property in the extinction of the phylloxera, as he believes this pest would not be able to go through the necessary metamorphoses in a soil manured with the leaves and stalks of the plant.

**TAKE CARE OF YOUR HEALTH.**—One of the most foolish things that men or women can do is to kill themselves, or to exhaust their energies and wreck their health. No one is benefited by such imprudence; nor does any one ordinarily thank them for their pains. What you are is more important to ordinary minds than what you have done. You may have performed immense labors, but if you are sickly, and son, and dyspeptic, and querulous, people will forget your services, and he attracted by the superior personality of others who may have accomplished far less than yourself.

## The Week.

The great storm which has flooded the State has ceased and the waters are subsiding, but from all directions we hear complaints of destruction and damage. As yet, however, it is possible that many of these reports are exaggerated and a more calm survey of the situation will show that the money loss is less than was supposed.

Considerable damage has been done by the heavy rains in breaking ditches, washing away flumes, etc.; but the ravines and gulches have been cleared of tailings, tail races have been swept out, and the ground well soaked, so many of the surface miners have been rather benefited.

In quartz mining operations, however, the heavy rainfall has been detrimental. Mines supplied with pumping machinery adapted to handle an ordinary flow of surface water, have been flooded by the sudden and large rainfall, by reason of the inability of pumps to handle the increase. Some of these mines will be able to start up in a few days, but others cannot begin again until the rainy season is over.

In another column will be found the details of legislative action during the week. The most important action is that on the debris matter.

There is no special news to note in mining matters. The passage of miners southward still continues, and Arizona and New Mexico are likely to be pretty thoroughly prospected this summer.

The latest excitement in mining affairs is in the direction of Alaska, where rich gold finds are reported. We have referred to these more at length in another column. The region about Alaska is so far from here that it is likely that some miners will think it better than the regions nearer home; but it is likely that there are men enough there now to work all the mines that will be found.

## Copper.

The fluctuations in the value of copper during the first six months of this year, 1880, were very severe and rapid, while during the latter part of the year there has not been very much change. In the English market ore of good produce has varied from 15s. 3d. to 11s. 3d., and 11s. 9d. to 12s. 4d., per unit.

Opening at £65 10s., a strong demand sprang up early in January, 1880, for Chile brass and English copper, for the United States and for manufactured for India, causing considerable excitement and an advance in price. Charters continuing large, and stocks increasing, values gradually declined until, in March, the advance of £8 per ton gained in January was lost.

In June again there was a speculative up and down, but since that time fluctuations in values have been slight.

It seems there has been a falling off in the exports for Chile during 1880 of about 700 tons, compared with the previous five years, and of 8,500 tons compared with 1879. Yet the production of precipitate and pyrites in Spain has steadily advanced and is now 85% greater than in 1875-76, and 4,350 tons in excess of 1879.

According to the estimates based on figures in James Lewis & Son's circular, the English consumption of copper shows an increase in 1880 of nearly 2,000 tons over 1879, and 6,000 tons over 1878. The decreased export of foreign is accounted for by large shipments of Chile bar direct to France.

As a matter of curiosity we will compare the figures for three years, showing the extent of the business in England.

First taking the imports with the contents of ore regular and precipitate reduced in figures to "tons fine."

IMPORTS.			
	1878.	1879.	1880.
	Tons Fine.	Tons Fine.	Tons Fine.

Total.....	57,299	66,345	63,559
Difference, Tons Fine.....	27,833	29,124	27,481

Stocks of all kinds in Eng. at end of year, 1879, 1880.  
Apparent Eng. cons. of French copper, 17,586 23,233 25,190  
Production of Cornish mines..... 3,338 2,884 2,754  
British ores sold at Swansea..... 412 157 234  
Apparent Eng. consumption of copper, 21,255 25,394 27,778  
Stocks of copper in Fr. at end of year, 1,139 4,600 6,462

The English imports of Chile ores in 1878 were 10,314 tons, and in 1877, 7,949 tons; but they have gradually decreased, till in 1879 only 461 tons were imported. The importation of Cape copper has increased to a slight degree. The imports from other countries have increased largely however, being nearly double now what it was in 1875. The import of Spanish precipitate and pyrites in 1878 was 27,616 tons fine; in 1879, 30,199 tons fine, and in 1880, 34,652 tons fine.

Import of Chile ores, regular, bars and ingots, into England in 1878 were 37,990 tons fine; in 1879, 44,137 tons fine, and in 1880, 33,993 tons fine.

Import of Chile copper into France in 1878 was 6,364 tons fine; in 1879, 3,600 tons fine, and in 1880, 10,545 tons fine.

The total import of Chile copper into both England and France in 1878 was 44,354 tons fine; in 1879, 47,743 tons fine; in 1880, 44,543 tons fine.

The export from Chile to all countries was, in 1878, 46,931 tons fine; in 1879, 49,500 tons fine, and in 1880, 41,000 (estimated) tons fine.

To conclude, we give a table from James Lewis & Son's circular, showing the average value of Chile here and ore, and the available stocks of copper in England and France for the period named:

	Bars.	Ore.	Stock.
	£62 10s	12s 9d	Tons Fine.
Average.....1880	55s 5s	11s 6d	45,047
Average.....1879	55s 5s	11s 6d	41,943
Average.....1878	55s 5s	11s 6d	35,743
Average.....1877	55s 5s	11s 6d	29,134

**MINING DIVIDENDS IN JANUARY.**—The following mining companies paid dividends in January: Deadwood-Terra M. Co., 25c per share, \$50,000; Enreka Con. Mining Co., 50c per share, \$25,000; Homestake Mining Co., 30c per share, \$30,000; Idaho Mining Co., \$5 per share, \$15,500; Indian Queen Mining Co., 4c per share, \$5,000; Indian Queen Mining Co., 4c per share, \$5,000; New York Hill Mining Co., 20c per share, \$10,000; Northern Belle Mining Co., 50c per share, \$25,000; Ontario Mining Co., 50c per share, \$50,000; Silver King Mining Co., 25c per share, \$25,000; Standard Con. Mining Co., 75c per share, \$75,000; Western Mining Co., 75c per share, \$75,000. This makes a total of \$390,500 as compared with \$403,900 in the same month of 1880.

THIRTY men are at work at the mines at "Placeritas," nine miles from Laguna, San Diego county. Twelve astras are at work. A chunk of gold sent in during the week made return of \$83.

## Miners' Wages at Silver Reef.

As will be seen by an item in our "Mining Summary," there is trouble at Silver Reef, Utah, the "Sandstone district," about wages. Inasmuch as the whole matter is this: The miners receive \$4 per day; the mine owners say the miners cannot pay this sum, and he worked at any profit; the miners refuse to take less; the mine owners refused to pay more than \$3.50, and the mine shut down. The Silver Reef Miner says: "On Tuesday morning, the 1st inst., upon the miners going to the Buckeye mine, of the Stormont company, they were met by Supt. Allen, who informed them that all men going into the mine had to work for \$3.50 per day. Upon learning this, the men went back to town, dressed themselves, and then marched down to the mine in a body, and ordered every man working in it to come on top. These men then joined the crowd, and all proceeded to the Savage shaft; and the men working there also came out of the shaft, and fell in line. They then very orderly and quietly marched to the Berbee & Walker mine, and told the miners to come on top, which they did, and also fell in line. The Barbee & Walker company were given until noon Wednesday to clean up their mill, and then shut her down. The crowd then marched over to town." The Berbee & Walker made a draft of about 30 men on the 1st inst. Dead work has ceased, and all the men now employed are working in ore. The mill is running as usual. The Miners' Union intend fighting out the question on the \$4 line. The principal mine of the Stormont company has been shut down, the pumps hoisted out, and before long the mine must be flooded. If no amicable compromise can be effected before the workings are submerged, the Buckeye will probably be a ruined mine.

It is understood that the three companies, Stormont, Christy and Barbee & Walker, have contemplated this reduction some time, owing to the fact that miners' wages are higher in the camp than at any other in Utah. They claim there is no reason for this, as living is cheap, mines dry and easy to work, and climates healthy. They wanted to reduce to \$3.50 for underground, and \$3 for surface work. The Christy, as we understand it, was in the plan to reduce wages, but the Superintendent did not close his mine, having come out as a \$4 man when the troubles began. The other two companies are now making the fight. The arguments used by the mine owners are that the ores of the district will no longer stand these wages and they cannot pay more than expenses to run the mines. The miners, of course, deny this, and say that they will stick to \$4 per day, or not work at all. The Miners' Union comprises some 300 men—all the miners there are in the camp.

## Map of an Important Mining Region.

We publish in this number of the PRESS a lengthy article on the country traversed by the Carson and Colorado railroad, illustrating the same with a map showing the location of the principal mining districts, towns and other localities in that region. The map is a "sketchy" one, and has no pretence of being strictly accurate, but will serve to show the relative positions of the various parts. The table of distances, on the whole, however, will be found accurate.

The section of country covered by this map comprises some 30,000 square miles situated adjacent to the line of the railroad, and extending from 60 to 80 miles on either side of the boundary line between the States of California and Nevada.

It is known to be rich in almost every form of mineral and metallic wealth, but little of which could heretofore be turned to profitable account, owing to the great cost of freights, all of which had to be transported on wagons and pack animals, and generally over long stretches of barren and sandy country. It was for packing over some of the routes extending into this region that camels were at one time used, these animals having been employed for bringing out salt from some of the many salines existing there.

Through the construction of this railroad the carriage of goods is likely to be so cheapened as to give a great impetus to mining off that way, the business having already sensibly improved in anticipation of the benefit to be derived from railroad transportation. The map presented, while it makes but a meager topographical display, and claims to be only approximately correct, will, in connection with the table of distances given, be of service to parties visiting, or especially interested in that section of country, touching which, this class of data is very incomplete, and often inaccurate.

The Antioch Ledger says that the owners of the Empire railroad, who have bought the well-known Central mine, will immediately commence the construction of a railroad connecting the Central with the Empire. The road will cross three other and intervening claims, namely, the Pioche, Hartshorne and Corcoran, through all of which the coal measures extend. Work will be commenced in the Central in a few weeks, and a new mining town will spring up similar to Judonville and Somersville.

## Legislative.

The principal topic of interest discussed by the Legislature during the past week has been the Debris Act repeal question. After much discussion and exhaustive argument the repeal bill passed the Senate on Tuesday by the vote of 32 to 8. Motion to reconsider was given and next day reconsideration was refused by a vote of 27 to 12.

This bill to establish and support a Bureau of Land and Labor Statistics was discussed at length on second reading. The author of this measure, Senator Enos, made a vigorous speech, citing the establishment of such a bureau in the Eastern States, and the good results therefrom. He said 40,000 laboring men of California demanded the enactment of the law.

The committee on corporations has reported adversely on Assembly bill No. 93, (which we have previously given) regulating the buying and selling of stocks on margin.

On motion of Kellogg, the resolution asking Congress for relief for settlers on mineral lands on the 16th and 36th sections, was taken up and adopted in the Assembly. This bill we have previously given.

The Committee on Public Buildings reported in favor of the passage of the bill compelling all public buildings to have doors swing outward.

Senator Wasson, of the Committee on mines and mining, reported adversely to bill No. 81, relative to amending the mining law. This bill related to the formation of mining districts and to the arrangement of mining laws in the California code.

The Senate Committee on Water Rights and Drainage met Monday evening, and considered Harlan's bill relative to hydraulic mining and stopping the debris. One bill, making it a misdemeanor for any miner to run his debris upon agricultural land, was reported unfavorably. Another, and the most important of all, was to permit plaintiff, in actions for damage against miners, to join, or, in other words, show damages in severalty. This bill it was agreed to report favorably. Harlan's bill to abolish the office of State Engineer was considered, and after amendment, so as to abolish the office after July, 1881, it was agreed to report it for passage.

Assembly bill No. 295, by Mr. O'Connor, relates to mechanics' liens. Any person or firm, mechanic, material man, artisan, or laborer, who may bestow labor, or furnish material, fixtures, or tools to erect any house, improvement, or to repair any building or improvement whatever, to have a lien on such house, etc., and also on the lot or lots, or land, necessarily connected therewith, or on the leasehold interest, to secure payment for labor done, etc. To fix and secure the lien this person to have the right at any time within—after this debt becomes due, to file his contract, if in writing, with this Recorder, to be recorded by the Recorder. If the contract, order, or agreement be oral, a duplicate copy of the bill of items shall be made, under oath, one to the Recorder and the other to the debtor. Both the contracts and accounts, when filed and recorded, shall be accompanied by a description of the lands, lots, houses and improvements, etc. When such contract or account is filed and recorded, it shall be deemed sufficient diligence to secure the lien herein provided. Fee for filing 50 cts. The lien to extend to the land designated, and the person enforcing the same may have the lot or lots and improvements sold together, or he may have the improvements separately sold.

## The State Mining Bureau.

Two bills which relate to the State Mining Bureau, both introduced by Mr. Wasson, are now pending before the Legislature. These sections of the first bill, as amended, are as follows:

SECTION 1. On a written demand of the State Mineralogist, the State Librarian is hereby authorized and directed to deliver to him the cabinet of minerals, with all the fixtures thereto belonging and appertaining, now in the State Library; and the Secretary of the Board of Regents of the University of California, or any authorized officer thereof, shall, in like manner, deliver all of the engraving, camping, and other instruments and utensils and material, not used or needed by the State University, the property of the State Geological Survey, and which was placed in the University for safe keeping.

Sec. 2. A sum not exceeding \$150 is hereby appropriated, under the superintendence of the State Mineralogist, for the purpose of defraying the expense of removal of said property to the Mineralogical Museum, in the City of San Francisco.

The other bill appropriates \$10,000 for two years, as the following section shows:

SECTION 1. For the purpose of increasing the efficiency of the State Mining Bureau, and in order that the legitimate mining interests of every character in the State may be to a greater extent understood, fostered, and encouraged, the sum of ten thousand dollars (\$10,000) for each of the years 1881 and 1882, is hereby appropriated and set aside, out of any moneys in the general fund not otherwise appropriated, to the "Mining Bureau Fund," created by an act of the Legislature of the State, approved April 16th, 1880, entitled "An act to provide for the establishment and maintenance of a Mining Bureau." All amounts to be paid out of said fund shall first be allowed and audited by the State Board of Examiners.

## The Carson and Colorado Railroad.

## Mining Districts and Mineral Regions on the Line.

(Written for the PRESS.)

The extension of the Carson and Colorado Railroad into the country lying to the southeast of this place imparts to that region an interest and a prospective consequence that have not heretofore attached to it. As this is a country of "magnificent distances," its towns, mining camps, and other noteworthy localities being far apart, and not always laid down accurately on the maps, I have prepared and send you herewith some tables giving bearings and distances between many of these localities and a few central points. [See map on this page, EDS PRESS.] The data for these tables having been collected in good part during a trip recently made through that country, the same will, I think, be found tolerably accurate, the whole sufficiently so for most ordinary purposes. The places from which these courses and distances have been calculated are Carson City, Bodie, Aurora, and Columbus; each central to a number of mining towns, districts, or other important points, the distances being estimated along the roads and trails usually traveled.

## Mining Districts Tributary to the New Railroad.

To describe, with any fullness, the various mining districts that have, in times past, been organized throughout the extensive region that will afford more or less sustenance to the Carson and Colorado Railroad, would require many columns of the *Press*. Even a bare enumeration of them would make a long list, not much less than a hundred having been organized first and last. Not in all cases, however, have these districts been maintained. Many of them, fully a third, perhaps, have been deserted and suffered to fall into disuse, not having long survived the excitement that gave them birth. In numbers of them, even where an organization has been kept up, so little has been done that further mention of them may here be omitted, a few general remarks on some of the more important being all that can now be undertaken.

## The Bodie District.

As being the most lively, populous, and largely productive of these mining camps, first claims our attention, though even of this we shall not be able to speak with much detail. The town of Bodie has been for the past year, and still is, suffering from the reaction consequent upon the excitement that attended its earlier history, and the effects of which are now visible in every interest and branch of business connected with the place. Real estate has much depreciated in value, and the number of inhabitants having greatly diminished, the trade of the merchants and the patronage of the hotels, lodging houses, restaurants, and other minor callings, has fallen off in a like ratio. This, while it works a present hardship to those engaged in these pursuits, is, after all, a healthful process, being merely a sloughing, as it were, of the superfluous popu-

lation—an effort of business to adjust itself to a normal condition, and which, when effected, will make it better for all. Mining, the underlying industry over there, though less active than formerly, has not experienced the depression suffered by most other vocations.

Summarizing a little in this department, it may be observed that nearly all the larger companies at Bodie, say to the number of twenty or more, are employing about their usual labor force, the reductions made being mostly with the smaller companies, the majority of whom are also doing more or less work. All the stamps in the districts, about 160, have been kept running thus far, and ordinary interruptions excepted, are likely to be kept busy for the balance of the winter, fuel and ore having, as a general thing, been provided for. Even though no additions be made to the crushing capacity of the district, nor any new bodies of extra high grade ore be discovered, the gold product of Bodie for the current year ought to exceed two and a half million dollars, of which one-third, at least, will be paid out on labor account. While, taken as a whole, the value of the ledges in this district were at one time greatly overrated, still it must be conceded that there have been developed there some of the most sterling mines in the State, with the chances that others of large and possibly equal value will yet be opened up.

## Of the Mining Districts Located Around Bodie.

And to which it may be considered a sort of center, as denoted in the preceding tables, being nearly all comparatively new, not much can be said, as, indeed, not much can be expected of them, either in the way of hullion production

near it, and which being central to the entire group of mines in the district is in name often confounded with the latter. Both, after a short but prosperous career, went into a decline many years ago and from which they have only latterly shown any signs of recovery. Within the past year or two, owing chiefly to a well-planned and determined effort on the part of certain capitalists to prosecute deep explorations on one of the mines in the district, confidence in the resources of the latter has been measurably restored, leading to additional prospecting being done by other parties and causing some improvement in the business of the town. The exploratory work alluded to consists of a vertical shaft of large size, which, commenced several years ago on the Real Del Monte grounds, has now reached a depth of 700 ft., at which level the prospects, according to all accounts, are of a very flattering kind. A tunnel is being driven to thoroughly open up the Prospectus mine, in which a large body of good ore has already been cut. These, with some other ore developments of recent date, have tended to arouse the old residents of Aurora and stimulate them to engage in a more extended and methodical style of ore search than had for a long time been in vogue; their labors for many years before having been confined to pirouetting around through the old shafts and drifts after such small hunches of rich ore as had been overlooked, and which, when got at, they managed to crush in some of the dilapidated mills, or more often in hand mortars; and in this manner they managed to get money enough to live along from hand to mouth. Under the new order of things the earnings of these people, if not larger, will be apt to be more steady and cer-

fuel and water, both of which have still to be brought from a long distance—the fuel from the sparsely wooded mountains from five to 10 miles away, and the water through iron pipes from a spring lying 12 miles to the west. The ore is rebellious and has to be roasted, after which it yields up about 90% of the silver it contains—it carries no gold. There are a great many ledges in the Columbus district, some of which, as for example the Mt. Diablo, Metallic, etc., have been extensively opened, and will no doubt after a while become profitably producing mines, there being here at the same time, as in every other district, many claims that will never amount to much. While the mining district of Columbus is so tolerably prosperous the town itself is dull, most of the business once done there having been transferred to Belleville and Candelaria, the latter situated nearer the principal mines. The old town receives, however, considerable support from the farmers of Fish Lake valley and the teamsters who haul freight to the mining camps lying off to the south and east. Of the many

## Mining Districts Situated Within a Radius of 60 or 70 miles of Columbus.

Only a few of the more important can at this writing be noticed. Concerning those lying off to the north and northwest, it may be remarked that the most of them were organized many years ago, but being in a dry and barren region of country, and the claim-holders being men of small means, but little work has been done in any of these districts, though the most of them show good evidence of valuable ore deposits. They contain now but a small population and, with the exception of two or three small and poorly equipped mills, are without reduction works.

Looking to the south and southwest we come first to the Black Mountain district, lying 14 miles beyond Belleville, site of the Eadown mine, which a few years ago was worked with success, but has latterly been idle. The company have a 5-stamp mill at the little town of Marietta, three and a half miles from their mine, but the mill, like the town and the mine, has come to a standstill, the place and the property, with the country around, presenting a thriftless and forlorn appearance. The several mines farther on to the southwest, around the hamlet of Partwick, are doing, as they for many years have done, moderately well—small quantities of rich, sthborn ores, from which careful treatment wrings a fair percentage of the precious metals. Twenty-five miles southwest of Columbus, and 15 east of Benton is situated

## The Indian Queen Mine.

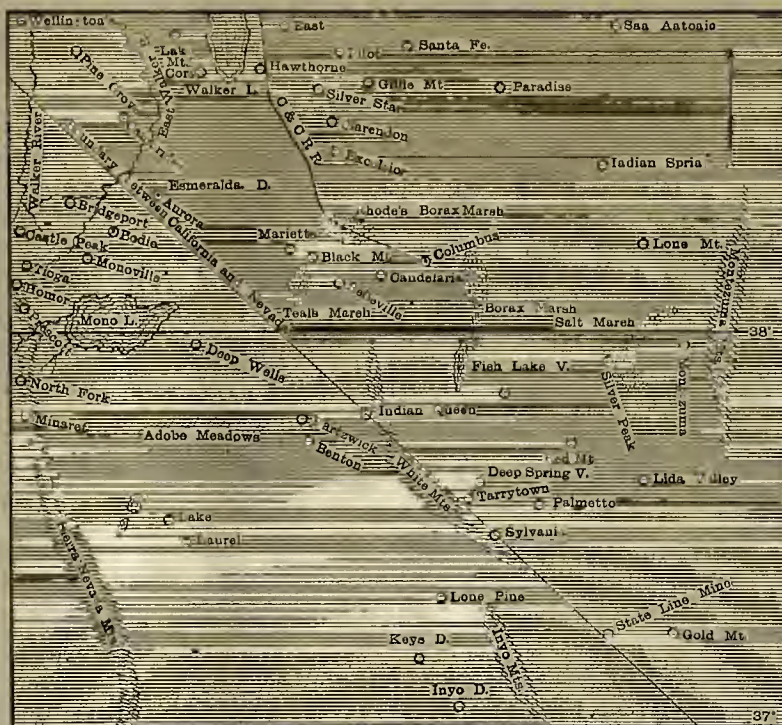

Outfitted with a 5-stamp mill and an improved Howell roasting furnace. The ore here, though rich—pulp assays averaging about \$130 per ton—are base to a degree that renders them extremely intractable. A viler combination of metals and minerals than this ore contains it would be difficult to find; yet, so thoroughly is it desulphurized and chloridized through the use of this apparatus that 95% of the silver is readily extracted from the pulp by pan amalgamation. This furnace, which consists of a conical cylinder, self-feeding and set on an incline, is the invention of John Howell, a miner of long experience and a metallurgist of great practical skill, and under whose general supervision the Indian Queen mine has been engineered to a marked success. With only a 5-stamp mill this property is yielding at the rate of nearly \$100,000 per year, its total product to date having been not much less than a million dollars, on which the net profits have been exceptionally large. The mine, which is located in a sag on the westerly slope of the White mountains, at an elevation of over 10,000 ft., is opened and worked by a series of five tunnels run in and with the lode, and which, being the one above the other, have afforded facilities for cheap ore extraction, and thorough drainage. The ledge, though small, is exceedingly rich and occupying a true fissure is likely to prove permanent. The reserves at a depth of 400 ft., are large and carry a higher grade ore than at any point above. But the mine itself is not better than hundreds of others in that region, its great success, achieved under many difficulties, having been mainly due to the employment of the Howell roaster and a generally good management.

Crossing the White mountains and traveling southeast a distance of 35 miles, passing on our route through Deep Spring valley, where there is water and some good land with undeveloped quartz lodes all round, we come to

## The Sylvania District.

Also abounding with metalliferous veins from four to ten ft. wide and well charged with ores carrying silver, lead, antimony, etc. Many shafts, 20 to 100 ft. in depth, have been sunk here and some ore taken out. A lot of it was sent to the Indian Queen mill and there worked by John Howell, who returned \$170 per ton, being over 80% of the silver it contained. Though considerably vitiated with antimony, arsenic, etc., it is a good smelting ore, containing itself all the requisite fluxes. And by this method it will most likely be treated hereafter, as the district is pretty well supplied with wood and water, though thus far without reduction works of any kind. Proceeding in the same direction as before, 20 miles bring us to Gold Mountain, a district formed many years ago and in which about 100 claims have been located and a considerable amount of work done. A 10-stamp mill was put up here at an early day, but the

[CONTINUED ON PAGE 112.]

MAP OF MINERAL REGION NEAR LINE OF CARSON &amp; COLORADO R. R.

or development. In a mineral belt lying to the westward of the town, and stretching in a northerly and southerly direction for a distance of fifty or sixty miles, a great number of gold and silver bearing lodes have been discovered within the past few years, which led to the organization of the following mining districts along it, viz.: The Castle Peak, Mountain View, Tioga, Homer, Prescott, Buckeye, North Fork and Minaret; some of which lie along the easterly slope, and others quite on the summit of the Sierra Nevada. Touching the mineral deposits in these districts it may be said that many of them are highly spoken of by the miners who have been at work upon them, a few, also, having been favorably reported upon by experts sent to examine them. Not much work, however, has yet been done upon any of the ledges there, leaving their absolute value to be demonstrated. As the winters are long and the snow falls to a great depth in that region, not till suitable buildings are erected and explorations are so advanced that the miners can labor under cover can much effective work be done. As wood and water are, however, abundant there, ore reduction can be performed cheaply should there be necessity for prosecuting the business on a large scale.

The Mammoth mine, Lake District, having failed to verify the favorable predictions made concerning it several years ago, albeit a great deal of money has since been expended in equipping and working it, this district, in common with the two or three others lying near it, has suffered in its prestige as well as in its more vital interests. Owing to this and other untoward causes, a general dullness pervades the Laurel and other districts in the vicinity of Lake.

## Esmeralda and Aurora

In their local significance mean about the same thing; the former being the name of a mining district and the latter of the only town in or

tain. Though still a little murky, the clouds are beginning to lift over there about Esmeralda.

## Cambridge and Pine Grove.

In the Cambridge, formerly called the Washington, and still earlier the Salt Spring district, situated on the East Walker river, ex-Governor Blasdel, who owns most of the mines there, is running a 10-stamp mill on the gold-bearing quartz which several of the lodes yield of good quality and in considerable quantity. Mining is there supplemented by farming, some 200 acres of land under careful irrigation being made to produce good crops of grain, alfalfa, etc. At Pine Grove, six miles northwest of Cambridge, one, and sometimes two of the several mills formerly put up there is kept running steadily, the annual hullion product of the place being about \$100,000 in gold. The district, which was organized in 1867 and a considerable town built up soon after, has been kept back by a variety of causes, some of which a fair display of energy ought to have overcome. A good deal of prospecting is going on and some work being done, and, taken altogether, the outlook for the district and neighborhood is tolerably good.

## Columbus and Surroundings.

Coming to Columbus we enter a broad field, it being the center of a metal-bearing territory rich and varied in its resources and imperial in extent. From the mines lying in the immediate vicinity not less than \$15,000,000 have been extracted, their yield for some years past having been over \$1,000,000 per annum. Among these the largest producer has been and still is the Northern Belle, which, whether assured of a long life lease or not, would seem to possess a good deal of present vitality. The mine is well developed and said to show a good stock of \$100-ore. The two large mills of the company are located at Belleville, eight miles west of the mine, placed there for greater convenience to

### The Floods and the Debris.

The Grass Valley Union says: The recent extraordinary storm has made a flood of water in the valley only second to the great overflow of 1861-2, which caused widespread devastation. The levees have broken in many places, and large areas of land have been flooded, which will result in great loss and inconvenience to those who hoped that they were protected by the embankments which had been constructed with so much labor and expense. This flood is already being used by the anti-debris men as a weapon to fight hydraulic mining, as they assume without the mining debris in the bed of the streams, the flood would have been borne in the channels and the levees would have remained intact. It would probably be useless to attempt to convince these men, who are disposed to hold the miners responsible for the phenomena of nature, that the extraordinary downpour of water from the precipitous watersheds of the Sierra Nevadas is something that can hardly be brought under the control of human efforts, but yet it is our privilege to point out that in the great flood of '61-2, when there was comparatively little debris in the river beds, the overflow of the valley was sufficient to extend the water from the foothills of the Sierras to that of the Coast Range. The water that poured into the valley was in an amount that no river channel could contain, and no levees could be reared high enough to hold. Then as now the water did as much damage from streams that descended from the non-mining regions, as that which went down from the auriferous hills of the Sierras, Putah and Cache creeks and numerous other streams that have their sources in the Coast Range, where no mining exists, sent out as destructive floods upon the valley as came from any other quarter. And so, too, at the present time, the Napa valley, which has no connection with any river system upon which mining is done, has been flooded to an unexampled extent, and great damage to property has resulted. The experience of the oldest settlers and flood-marks of perhaps a century ago go to prove that the valley of the Sacramento has been subject to flood visitations that made it a great inland sea, where its rivers would be currents in the wide waste of water. While the filling up of the river beds on this side of the valley, by mining debris, is an acknowledged fact, it cannot, in truth, be charged that that filling is responsible for the water breaking the levees below and flooding a large extent of country. The miners do not control the storms, neither have they builded the lofty Sierras, which sends the contents of the storm-clouds like an avalanche upon the low country. It is weak and querulous to ascribe to human agency that which is alone attributable to the forces of nature, and beyond human control.

**MOVEMENTS OF RAILROAD TRAINS.**—It is announced that in a few days the overland train will leave this city at 8 o'clock instead of 9:30, as at present. The 4 o'clock train will leave as usual for Los Angeles and Arizona. The 4:30 train will go by Niles, Livermore and Pleasanton, overtaking the Los Angeles train at Lathrop, and reaching Sacramento at 10 o'clock. The 7:30 train will go to Vallejo, Woodland and Willows. The noon train from Sacramento has been abandoned. The overland will arrive here from 1:15 to 1:20 P. M. The last train in the evening will arrive about 9:30 P. M. It is probable that the overland train will go via Stockton for about two or three months.

**PACIFIC ROLLING MILL.**—At the annual meeting of the stockholders of the Pacific Rolling Mill Company, the following gentlemen were elected directors for the ensuing year: D. O. Mills, William Alvord, Louis McLane, Nicholas Luning and James G. Fair. Subsequently the following officers were elected: President, William Alvord; General Manager, L. B. Benchley; Superintendent, Patrick Noble; Secretary, C. M. Keeney.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarrad Manila Rope, Hay Rope, Whale Line, etc., etc.  
Extra sizes and lengths made to order on short notice.  
**TUBBS & CO.,**  
611 and 613 Front Street, San Francisco

## MOREY & SPERRY,

MANUFACTURERS OF

### Gold and Silver Grinding and Amalgamating Machinery

**HOWLAND'S PULVERIZER** Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills' Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supply Iron Work complete for Wood Frames, also

**SPERRY'S**  
**WROUGHT IRON FRAME**  
**FOR STAMP MILLS.**

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores, Wet or Dry Crushing Mortars.

**MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.**

**PACIFIC MACHINERY DEPOT.**

## H. P. GREGORY & CO.,

Nos. 2 and 4 California Street, San Francisco.

Importers and Dealers in every description of

### MACHINERY!

Sole Agents for the Pacific Coast for

## BUCKEYE

### Engine Company.

J. A. Fay & Co.'s Wood-Working Machinery; Bennett & Sons' Machinists' Tools; Blake Steam Pumps; N. Y. Belting and Packing Co.'s Rubber Goods; Sturtevant Flowery and Exhaust Fan; Tait's Co.'s Emery Wheels and Machinery; Payne's Vertical Engines and Boilers; Perry's Centrifugal Pumps; Judson's Standard Governors; Dreyfus Self-Oilers; Gould Mfg. Co.'s Hand and Power Pumps; Eclipse Windmills; Diston & Sons Circular Saws; Otto Silent Gas Engine; Dues' Elevator Cups; Ballard's Oak Tanned Belting.

Also on hand and for sale A FULL LINE OF MILL AND MINING SUPPLIES.

## NOTICE!

**ENGINEERS, DEALERS AND USERS OF STEAM PUMPS**

Will Please take notice that we have taken the sole agency for the **KNOWLES' STEAM PUMP**, for the Pacific Coast States and Territories, and keep a full stock of Pumps and Duplicate Parts on hand at all times.

**PARKE & LACY,**

Nos. 21 and 23 FREMONT STREET.

San Francisco, Cal., September 23, 1880.

## LEFFEL'S IMPROVED WATER WHEEL.

**PRICES REDUCED!**

**PATENTS REISSUED 1868.**

The "OLD RELIABLE" with improvements, making it

**THE MOST PERFECT TURBINE NOW IN USE.**

Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head in this country. Our new Illustrated Book sent free to those owning water power.

Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

**JAMES LEFFEL & CO., Springfield, Ohio,**  
and 110 Liberty St., N. Y. City.

**PARKE & LACY, Sole Agents, 21 and 23 Fremont St., S. F.**

## SAVE YOUR GOLD AND SILVER.

I am prepared to demonstrate, if miners will bring me from 500 pounds to a ton of their ores, that I can save from 25 to 100 per cent. more than any other machinery now in use. I will make no charge.  
Machinery can be seen in operation every day at No. 143 Fremont Street.

**M. B. DODGE.**

**J. H. WYTHE, M. D.**

Residence: 985 West Street, Oakland. Office: 759 Market St., San Francisco  
Before 10 A. M., after 5 P. M. From 11 A. M. to 3 P. M.

### Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates

**WIND MILL.** One of the best made in this State for sale cheap on easy terms. Address, W. T., care of Dewey & Co., S. F.

### A Card from Architects.

**The California Architect and Building Review.**

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city: Believing that a journal of this kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huernie, John Marquis, B. McDougal & Son, Wm. Mosser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. J. Newsom, B. Hendrickson

**New Book on the Comstock.**

The attention of MINING ENGINEERS and EXPERTS is called to the new work by JOHN A. CHURCH, E. M. PH. D., on "The Comstock Lode, Its Formation and History." This very exhaustive treatise on this famous lode is fully illustrated with diagrams and colored charts showing sections, ore bodies, etc., and will be of great interest and permanent value for reference. DEWEY & Co., Publishers of the MINING AND SCIENTIFIC PRESS, are sole agents for the sale of the work. Mr. E. M. SLEATOR will act as their agent, and call on Mining Engineers and those interested in the great lode in this city with a copy of the book for their inspection.

### THE IMPROVED INGERSOLL

### Rock Drill and Air Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Comstock.

**GEO. R. FOARD, GEN'L AGENT,**  
No. 18, First St., S. F.

### CAUTION.

To the Public Generally.  
Notice is hereby given that George R. Foard, of No. 18 First Street, San Francisco, is the sole authorized agent for the sale of our manufactures, consisting of Rock Drills, Air Compressors, and duplicate parts of either in the territory known as the Pacific Slope, and that no other person or persons have any right or authority to represent themselves as the agents of this Company within the above mentioned territory. Also, take notice, that all persons manufacturing, or using any Rock Drills, Air Compressors, or duplicate parts of either, manufactured by others, embracing in their construction the mechanical inventions and appliances covered by the Patents owned by this Company, will be prosecuted for such infringement.  
**INGERSOLL ROCK DRILL CO.**  
New York, November 30, 1880.

### Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by **DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.**

**BY GUIDO KUSTEL,**

MINING ENGINEER AND METALLURGIST.

**Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Cold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.**

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

**ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.**

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. It contains 150 pages, embracing illustrations of furnaces, equipments and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3.00 coin, postage free.

### LEACHING

### Gold and Silver Ores,

By C. H. AARON.

The most complete Hand-book on the subject extant, 104 pages octavo. Illustrated by 12 Lithographic Engravings and Four Woodcuts. Fully indexed. Plainly written for practical men. In cloth, \$3.00. Sold by

**A. J. LEARY, Stationer,**  
402 & 404 Sansome Street, San Francisco.  
Send for Circular.

## CALIFORNIA Electric Light Company.

Owners of the Brush System of Electric Lighting for the Pacific Coast. Apparatus for sale for Mines, Mills, Manufactories, etc. Plating Machines and Machines for treating Ore manufactured to order. Electric Light furnished on all the principal streets of the city.

**Office—No. 119 O'Farrell Street,**  
**SAN FRANCISCO, CAL.**

Engraving done at this office.

**Metallurgy and Ores.**

**WM. D. JOHNSTON,**  
(Formerly Chief Assayer with Thos. Price.)  
**ASSAYER AND ANALYTICAL CHEMIST,**  
118 & 120 Halleck Street,

ASSAYING TAUGHT.

Personal attention insures correct returns.

**Nevada Metallurgical Works,**

No. 23 STEVENSON STREET,  
Near First and Market Streets.

Ores worked by any process.  
Ores sampled.  
ASSAYING in all its branches.  
Analysis of Ores, Minerals, Waters, etc.  
WORKING TESTS MADE.  
Plans furnished for the most suitable process for working Ores.

Special attention paid to Examinations of Mines; plans and reports furnished.

E. HUH,  
C. A. LUCKHARDT,  
Mining Engineers and Metallurgists

**JOHN TAYLOR & CO.,**

IMPORTERS OF AND DEALERS IN

**ASSAYERS' MATERIALS,**  
**MINE and MILL SUPPLIES,**

**CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
GISTS' GLASSWARE AND SUNDRIES, Etc.**

118 and 120 Market Street, and 15 and 17  
California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods both as to quality and price. Our *New Illustrated Catalogue*, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

# PATENTS AND INVENTIONS.

## List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.

FOR THE WEEK ENDING JANUARY 4TH, 1881.

236,133—DREDGING BUCKET—J. A. Ball, Oakland, Cal.  
 246,207.—NAPKIN RING—Geo. H. Behan, S. F.  
 236,306.—FRUIT BOX—R. J. & M. Cooke, Sacramento, Cal.  
 236,154.—WAGON JACK, E. S. Gerow—Cordelia, Cal.  
 236,320.—ARITHMETICAL FRAME—F. B. Ginn.  
 236,338.—ORE CRUSHER—F. A. Huntington, S. F.  
 236,168.—INKING-PAD CASE AND STAMP RACK—C. A. Klinkner, S. F.  
 236,171.—COLLAR BUTTON—R. Matthal, S. F.  
 236,243.—MOVABLE DAM—J. D. Osterhout; San Bernardino, Cal.  
 236,251.—REFINING APPARATUS—P. Percy, S. F.  
 236,353.—HAY PRESS—T. Phares, Eureka, Cal.  
 236,356.—TANK STRAP—E. Pomeroy, San Jose, Cal.  
 236,179.—OFFICE DESK—I. B. Robbins, Stockton, Cal.  
 236,182.—THRUSHING MACHINE—G. W. Schenck, S. F.  
 236,183.—CIGAR-LIGHTING LAMP—W. R. H. Scheunert, Sacramento, Cal.  
 236,274.—BARKING APPARATUS FOR FURNACES—J. O. Stewart, Alameda, Cal.  
 236,277.—WINDMILL—W. O. Swinnerton & E. B. Saunders, San Jose, Cal.  
 236,282.—LEVEL—W. W. Vaughn, Stockton, Cal.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

**FLOW.**—C. Grattan, Stockton, Cal. The object of this invention is to provide a number of shallow-cutting plows, which shall work over a large surface at each passage of the machine, and which will pulverize the top of the ground and keep it in a moist condition, so that when large plows are used for deep summer fallowing, the ground will turn up in a finely pulverized condition throughout, instead of being in large, hard lumps, as would be the case when large plows are put into unbroken soil. This plow is specially adapted for plowing in seed; and on account of its large size and consequent rapidity of its work, time may be given for the weeds to appear after the early rains before the seed is put in, as the plow will cut down all these weeds.

**TAP AND FAUCET.**—E. H. Crow, San Francisco. This invention relates to a tap and faucet for casks, kegs, barrels and other receptacles for liquids, the construction of which will permit the faucet to be easily removed, and can be used in any cask or keg in which the tap is placed. No hammering is required. The faucet fits easily and can be readily removed, while the hushing and sleeve snap the wood plug, and form a permanent and efficient method of closing the opening.

**HOOP IRON.**—The Cleveland Rolling Mill Company, Union Steel Screw Company and upwards of 40 other companies, firms and individuals prominently identified with iron interests here, have signed a memorial to be forwarded to General Garfield, setting forth that the late decisions of the Secretary of the Treasury are affecting seriously, if not utterly destroying the manufacture of hoop iron in the United States; and another decision now pending, as to the duty on tank or plate iron, is of like importance.

**NOT ENTIRELY PLAYED OUT.**—The attention of the *Rocky Mountain Mining Review* is called to the fact that Virginia City is still in existence. Mines are still being worked, mills are still running, and the camp is not completely wiped out, as we would infer from reading its editorials on the subject of late. Those "formerly famous bonanza mines" of which it speaks are still turning out two or three millions of dollars a year, and it is only from their comparatively greater productiveness that the amount seems small.

**BODIE BULLION.**—The following amounts of bullion were shipped from Bodie during the month of January, by the several mining companies named: Standard, \$185,645.70; Bodie, \$33,715.34; Noonday, \$26,355.75; Syndicate, \$16,712.11; Banks, etc., \$13,261; total, \$275,689.90.

In the hill northeast of the Lower Sink of the Carson river, Nevada, are some large veins of yellow ochre. It is pure and bright, and when burned makes a red almost as fine as vermilion. For ages the Indians have burned this ochre and use it for adorning their faces. In the same hill are strata of earth closely resembling umber.

In cost Sandy Bowers \$240,000 to erect the building now known as the "Bowers Mansion," in Washoe valley, Nev., and the furniture, books, pictures, etc., \$45,000 additional. The walls of the building are of blocks of the hardest granite.

THERE are 15 mines in Bodie district with steam hoisting works on which no work is being done. A number of them will be started up at an early day.

THE wagon bearing a 30,000 lb. steam cylinder for the Lent shaft, at Bodie, upset at Matthews' ranch, and the cylinder now lies buried in the mud.

## The Carson and Colorado Railroad.

[CONTINUED FROM PAGE 105.]

remoteness of the locality and a general scarcity of water have retarded developments, notwithstanding the mineral wealth of the district is known to be great. At last some new life seems likely to be infused into the place. A New York company, having purchased what is known as

### The State Line Mine,

Are about to erect thereon a large mill and to work the property in a vigorous and systematic manner. This mine, as its name might be supposed to suggest, lies partly in California and partly in Nevada, about one-third of the Gold Mountain District being on the California side of the boundary between these two States. On the claim, which is an extensive one, a good deal of work has been done and a considerable quantity of ore taken out. But this availed little, there being no mill in the district to work this ore and the former owners of the mine not being able themselves to put up one. And so the property, though evidently a good one, remained for years unproductive and practically valueless. Under the new ownership all this will be changed. Possessing ample means the present proprietors have planned and will conduct everything on a large scale. To this end I. M. Taylor, an experienced miner and millman, himself part owner of the property, has been put in charge in the field. It is a good selection, Taylor, as regards energy and sound business judgment, having no superior among the mine capitalists of the coast. The machinery for the new mill, which is to be of large capacity and first-class in all its appointments, is now being built in San Francisco; this, through a New York Company well appreciating the advantages of giving the work to establishments on the Pacific side. Meantime, the work goes on actively at the mine. Ore extraction is being diligently pushed; wood is being cut and piled up to dry, preparatory to be hauled to the mill; 12 miles of iron pipe is being laid down, that being the length required to bring water from an amply supplying spring upon the premises. What, with money paid out for labor, machinery supplies, etc., the expenditures of the company will amount to a large sum; and the number of employees, now considerable, will be much augmented when the mill comes to start up. Though commencing with 40 stamps, this number will be increased largely hereafter; it being the purpose of the new company to work their mine for all it is worth. It is even said that they are ambitious of emulating the great Black Hill mills as regards the number of stamps to be run. Touching bullion production they will hardly be satisfied with less than four times as much gold per ton of ore worked as the best Dakota mines turn out. The ore in the State Line mine, a quartz, bearing free gold, milling from \$33 to 35 per ton, stands in a solid, shapely mass nearly 30 ft across, and as the gangue, the walls and the country are all that could be desired, an early exhaustion of the stock here would imply a reversal of established geological laws, a thing not expected to occur in nature. The enterprise will be a success, and do much good by inducing other capitalists to embark their means in a region of country, which, though long neglected, possesses mineral resources second to no other in the State.

### Palmetto, Lyda Valley and Silver Peak

Leaving Gold Mountain and coming north we may, by slightly deflecting our course to the west, pass through the Palmetto district, with plenty of argentiferous lodes, but no reduction works and nothing done, and thence come on to Lyda valley, where the above remark might in part be repeated, the ledges here being even more numerous than at Palmetto, and the ores generally of a better grade and a more varied character, carrying gold as well as silver and lead. As the settlers in Lyda valley have enjoyed the further advantage of some small mills and furnaces, enabling them to reduce a portion of their ores, they have escaped the financial stringency experienced by most of their neighbors; yet even here mining lags, the district, despite a good deal done in a small way, being far from prosperous. What is required is capital to make the resources of the district available, these being ample for the profitable employment of large sums, now that a railroad is approaching and will, very likely, in the course of another year, traverse this group of mining districts. As capitalists have lately interested themselves at Gold Mountain and Montezuma, so might some of this class find it worth while to pay a little attention to Lyda valley and other of the districts previously spoken of.

A 20-mile stretch N. W. across Clayton valley brings the traveler to Silver Peak, which has an industrial history not at all cheerful, and which we cannot here stop to relate; suffice it to say, the disasters that overtook the extensive enterprise inaugurated there some 15 years ago, with its building of mills and heavy expenditure of money, were mainly due to mismanagement, culpable or otherwise. Many of the mines there are good—good enough to have warranted all that has ever been done in their behalf, had it been done well. It is said that the property has lately passed into the hands of partisans who will soon resume operations upon it, and under auspices that promise better results than attended its former working. Let us hope it will so prove.

Standing at Silver Peak and looking east, a heavy range of mountains, dark with pinyon forests and verdant with pasturage, lifts itself to the height of 3,000 ft. above the intervening

salt marsh, shutting out the view in that direction. These are the Montezuma mountains, and a right pleasant sight they are, with so much grass and wood in this arid and timberless land. And a pleasant history is connected with them too, for here, covering the southern extremity of the land, is the site of

### The Montezuma Mining District,

A locality that has brought profit to many and loss to none; the mines there since their discovery in 1863 having been not only self-sustaining, but remunerative to all concerned. For the first few years the ore was taken to Austin, 145 miles, at a cost, hauling and reduction included, approximating \$200 per ton. The ore so disposed of averaged \$400 per ton, the higher grades only having been selected. Then Dawley and McGlew took in a 10-stamp mill under a contract to convey, when the structure was set up and completed, a one-half interest in it for 900 ft. of mining ground. Though this mill cost a large sum, the contract was fulfilled on the part of the men, who even then made money in the end. The ore here, always impure, becoming at last so base as to require roasting, a Howells furnace was procured and the difficulty for a time obviated. With increasing depth the greater proportion of the ore has now become so laded that it can be reduced to advantage by smelting, only. To meet this new want.

### A Smelting Furnace,

Of large capacity, is now being set up at a point convenient to the mines, and which will soon be ready for operations. While a single furnace will do to start with, another and perhaps several will ultimately be required as this ore is very abundant in the district. It is also of good average grade, carrying from 20 to 30 per cent. lead and about \$60 in silver, to the ton. The principal group of mines in the district together with about all the available water and a large tract of timber, is owned by a single company, mostly Boston capitalists, with the business office in that city. The management on the ground has been committed to John Howell, a thoroughly capable man and inventor of the furnace before alluded to. Of these mines, which number twenty or more, fully one-half are pretty well opened, several of them being very thoroughly explored and outfitted with hoisting works. As extensive bodies of ore of the kind above described have been developed, an immediate, large and well sustained production of bullion may be expected to follow the completion of the smelter now under way. This method of treating the argentiferous galenas at Montezuma, has long been contemplated but has been postponed awaiting the advent of the railroad into that region, wagon transportation of base bullion over such long stretches of desert and sandy country having been too costly to warrant recourse to smelting at an earlier date. For the new enterprise, in such competent hands, a fortunate issue may safely be predicted. Both the mines and the new enterprise directed to a further utilization of their ores stand endorsed by one of our very ablest and most trustworthy mining engineers, who recently examined them with his accustomed impartiality and care.

### The Country Farther to the North and East.

Having said so much about the country lying adjacent to the route of the Carson & Colorado railroad, and which will, beyond any contingency, become tributary thereto, I refrain from remarking now upon a long line of mining districts situated farther to the north and east, and some of which will also be likely to afford that road material support. Beginning on the northwest, these districts consist of Elsworth, Union, Grantsville, (locality of the Alexander mine) all in the Sinkata valley, San Antonio, site of the Liberty mine, Belmont, Hot Creek and Tybo. Of these localities the three first named, including also, Belmont will be about aquidistant from Austin, terminus of the Nevada Central, and from the nearest point on the Carson & Colorado railroad, while Tybo and Hot Creek will occupy the same position relative to the latter, and Eureka, terminus of the Eureka and Palisade road. San Francisco freights destined to any of these districts would, however, if forwarded via Austin or Eureka, have to travel some 300 miles farther on the Central Pacific railroad than if stopping at Reno, they went in via the Virginia and Truckee and the Carson & Colorado roads. Beyond Tybo the latter road will take all the business throughout a belt of country 300 miles wide clear on to the Colorado.

Carson, Nev. Jan. 29th.

THE Tombstone *Nugget* congratulates the camp on the daily advent of capitalists and says: "Every day the stages from Benson come in loaded with passengers, and among them are a large number of capitalists who are here to see for themselves." When a rush of capitalists occurs it is just as well to see that some few of them at least are not the kind who hood a mine and borrow money enough from the owners to return to their principals with an order to report.

WE see the following in the *Mariposa Gazette*: A friend who resides near Hite's Cove on the South Fork, informs us that Hite's sand mill, situated about one-half mile below on the river from the main quartz crushing mill, together with the flume and tramway running thereto, have been washed away.

THE recent advance in lead is stimulating the low grade lead mines again.

## News in Brief.

RIPE oranges at Los Gatos.  
 THOMAS CARLYLE died last week.

In the Whole History of Medicine

No preparation has ever performed such marvelous cures or maintained so wide a reputation, as AYRES' CHERRY PECTORAL, which is recognized as the world's remedy for all diseases of the throat and lungs. Its long continuous series of wonderful cures in all climates has made it universally known as a safe and reliable agent to employ. Against ordinary colds, which are the forerunners of more serious disorders, it acts speedily and surely, always relieving suffering, and often saving life. The protection it affords, by its timely use in the throat and chest disorders of children, makes it an invaluable remedy to be kept always on hand in every house. No person can afford to be without it, and those who have once used it never will. From their knowledge of its composition and effects physicians use the CHERRY PECTORAL extensively in their practice, and Clergymen recommend it. It is absolutely certain in its remedial effects, and will always cure where cures are possible.

FOR SALE BY ALL DEALERS.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

THE MINING AND SCIENTIFIC PRESS finished its 41st volume with its last publication. We do not know the circulation of the paper in this community, but we do know that every mechanic and miner ought to take it, for by so doing they would benefit themselves far more financially than they are aware of.—*Shasta Courier*.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for \$3 per (half-yearly) volume. In cloth and either binding, \$5. These volumes, complete, are scarce, and valuable for future reference and library use.

How to STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So he signs and send us notice by letter.

—FOR—

Consumption, Asthma, Bronchitis, Dyspepsia, Catarrh, Headache, Neuralgia, Debility, Rheumatism,

And all CHRONIC and NERVOUS DISEASES.

PACKAGE CONVENIENTLY SENT BY EXPRESS, READY FOR USE

AT HOME.

A Treatise on Compound Oxygen, giving the history of this new discovery, and a large record of most remarkable cures, will be mailed free to all who ask for it. Also, "Health and Life," a quarterly journal, containing much interesting information. Write for it. Address the proprietors, DR. STARKEY & PALEN, 109 and 111 Grand street, Philadelphia, Pa., or H. E. MATHEWS, 606 Montgomery street, San Francisco, Cal., from whom can be procured both information and supplies.

'49 AND '50.

MR. JOHN VANCE CHENEY'S new historical story of early days upon this Coast will be commenced in the next number of "The Californian."

A NEW SERIAL STORY will be commenced in the next number of THE CALIFORNIAN which will run during the remainder of the year. It is entitled "'49 and '50," and is a story of early days upon this coast. The author is Mr. John Vance Cheney, whose articles in the leading Eastern magazines and in THE CALIFORNIAN have received such wide and merited recognition. Mr. Cheney has had this story in preparation for THE CALIFORNIAN for some time. Competent critics, to whom it has been submitted pronounce it at once realistic and fascinating. The stirring events of 1849 and the succeeding year are vividly pictured. Absolute truthfulness of impression is sought rather than idealization. A thread of romance runs through the work, and the interest is sustained to the end.—(Note Book).

NOW IS THE

TIME TO SUBSCRIBE.

"This magazine is only in its second year, but the merit shown renders it worthy of patronage from all parts of the country."—(Liberal Press, Woodbury, N. J.)

"An exceptionally bright periodical."—(New Haven Palladium.)

"A welcome visitor comes to us each month from the far off Pacific Coast. It is THE CALIFORNIAN, whose literary worth compares well with Eastern contemporaries. The January number is brimful of good things."—(Louisville Post.)

"There is a long list of attractive contents. It is an excellent number of a very good magazine."—(Philadelphia Inquirer.)

INCERSOLL

ECLIPSE ROCK DRILLS.

The Most Economical Air Compressors in the Market.

MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is hoisted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS & RIX,

49 Fremont St., S. F.

ST. DAVID'S,

A FIRST-CLASS LODGING HOUSE

CONTAINS 113 ROOMS.

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from \$2.50 upwards.

R. HUGHES, Proprietor.

At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

Mining & Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

## SECURE PATENTS

Through Dewey & Co.'s Patent Agency.

Scientific Press

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of invention in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

MINING AND MECHANICAL ENGINEERS.

Room 7, No. 109 California St., San Francisco, P. O. Box 2083

Cups for Engine, Machine and Shaft Bearings and Loose Pulleys. We furnish the Albany Compound (a solid), \$1 worth of which will last as long as from \$2 to \$10 worth of Oil, with no elor, and with ONE-TWENTIETH the ATTENTION required by the best Oil Cups. If the Cups are not satisfactory, we will receive them back and make no charge.

Cylinder corrosion is not so much owing to impure tallow or oil as to the fact that those animal fats do not maintain their integrity under steam heat, but decompose and set free acids which attack and destroy metal. The Albany Cylinder Oil does not contain fatty acids—is incapable of being decomposed and does not form insoluble soaps. If it becomes mixed with boiler incrustation it diminishes its tendency to cling to the side of the boiler, and thus exerts in this respect also a beneficial action.

THE ALBANY  
Cylinder Oil

Is now in use throughout the world, and we refer to nearly all first-class establishments on this coast for evidence of its efficacy.

Pure Winter Strained Lard Oil

By every vessel from New York.

ALBANY SPINDLE OIL,

Genuine West Virginia Lubricating Oil,

SIGNAL OIL for outside lights of vessels, etc.

The Albany Lubricating Compound and Cups, the Albany Spindle Oil, etc., can only be gotten from us or our agents. Send for catalogues.

Entirely different from other Saws. When dull, sharp teeth, which only cost a trifle, can be inserted in a few minutes, without taking the saw off of the mandrel, and no skill is required in doing it. Send for Catalogue showing their vast superiority. More of them are being sold than of any other kind, and we are altering all other kinds to the Chisel Tooth.

## Mining Accidents.

A man by the name of Louis Fravega, was caved on and killed instantly while at work in his claim near Whisky Slide mine, Calaveras county, last week. The man was alone in the claim at the time of the accident, but was found soon after the occurrence.

Soon after the workmen on the Santa Clara coal mine, Los Angeles county, left the mine for dinner the other day, the mine caved in through all its length. Had the accident occurred five minutes sooner, not one of the 14 miners would have escaped death.

At the Washington mine, Mariposa county, about 10 weeks ago, according to an informant of the *Gazette*, an accident occurred which illustrates the perils of a miner's life, and shows what narrow escapes can occur. It seems that while the bucket was on its way up from the 1400 ft. level, loaded with about a ton of rock, at a point 400 ft. from where it left the unsuspected miners below, by some means the brakeman above lost control of the rope, and the loaded bucket returned with much greater velocity than it went up, carrying with it four set of timbers which somewhat impeded its progress, and gave notice to the miners below that something besides ordinary thunder was the matter above. Quickly apprehending the situation they speedily took a vertical position close against the shaft, just in time to escape the awful death which was staring them in the face. The bucket fortunately passed through the fifth and last level, without hitting, striking about centrally the bottom of the shaft, simply grazing one of the men just enough to make him afterwards feel good at the thought of having so narrowly escaped death. The miners below who stood so well from under the terrible crash were Samuel Tibbetts, Richard Berkley and a Chinaman.

On Thursday of last week, while piping upon the claim of the Jones Hill gravel mining Co., El Dorado county, Nate Staten was pretty badly hurt. A small sized "cave" of earth came from the bank which, being thoroughly saturated with water from the excessive rains, ran along upon the bed rock like so much hot ashes, but with tremendous force. The flying mud splattered in his eyes, so blinded Staten that he was unable to see which way to run to escape the avalanche. While running he was caught, thrown down and partially covered by the debris. Upon being extricated he was found to have one badly fractured leg below the knee, besides other less serious bruises.

**THE CHASE COAL MINE FIRE.**—Advices from Victoria are to the effect that the fire in the Chase mine has burned through the roof of the No. 2 chamber, and is burning at a fearful rate in the slate stratum above. Owing to the intense heat and dense smoke it is impossible to ascertain the extent of the fire, or the direction in which it is traveling. The fire engine, however, is kept constantly at work day and night, but owing to the peculiar position of the fire the streams can only be sent up among the flames at intervals. Some incline to the opinion that the fire has struck a "pocket of coal;" others that the seams have split and the fire is now in another seam of coal. It is almost impossible to state the exact nature of the fire, for nearly every person working in the mine has a different opinion from his fellow-workman. One thing is certain; the fire is raging and, beyond causing a heavy daily expenditure of funds, is causing a great anxiety to the officers of the company and to citizens generally.

## New Geared Hoist for Round Rope.

No class of mining machinery is of more importance than hoisting works. The best mechanical talent of the coast has been brought to bear upon this subject for the past few years, and the improvement in this class of work has been very marked. Among the best new forms for hoists for single shafts that has been produced, is that illustrated on this page, made at the Pacific Iron Works, in this city. It embraces all the improvements and safeguards that experience has proved valuable in this class of machinery. It is adapted to all the requirements of practical work, and is in great favor with mines in all parts of the coast. The facilities which a hoist of this character affords for opening up a mine make it indispensable to any rapid and economical development.

The following is a description of the construction and operation of this machine: The drum is loose on the shaft, and is brought into

SINGLE DRUM GEARED HOIST FOR ROUND WIRE ROPE.

action by a clutch sliding on two steel feathers set into the shaft. The spur gear is keyed fast to the drum shaft, one bearing of which rests on a solid bracket, cast on engine frame, the other rests on a substantial bracket bolted to the foundation, which also supports the outboard end of the crank shaft. A friction band brake is attached to the fly wheel on crank shaft, and upright post brakes, with wood shoes, act upon the break ring of the drum, thus allowing the bucket to be lowered while the engine is at rest. The various levers, including the reverse lever and throttle valve, it will be observed, are arranged so as to be under the control of the engineer at one point.

They are made of two sizes and adapted to either vertical or incline shafts. A 6x10 cylinder is good for working to a depth of 400 ft. and an 8x12 for working to a depth of 600 ft.

Boilers of suitable capacity with feed pumps, are furnished at the above works; as also the axis head, sheave, shaft and boxes, making the rig complete.

**BODIE MINES.**—Twenty-three mines in Bodie are now being actively worked. Of this number, 17 have steam hoisting works of their own, two are being worked through adjacent mines having steam works, one is worked by tunnel, one by whim and two by windlass. A singular coincidence is that the two windlass mines (Union Con. and Jackson), one at the extreme north and the other at the extreme south end, have each recently made rich and important developments. Eighteen mines in the district having steam hoisting works and fair prospects of lying idle—chiefly for the want of means.

## Mining Litigation.

W. H. Howland has commenced suit against Simon Desmarchals in the Superior Court, to recover \$100,000 damages for a breach of contract on the part of defendant, to allow plaintiff to work the tailings of the French mine in El Dorado county, for one-half the gross proceeds extracted from the tailings.

The case of the Jupiter Mining Co., against the Bodie Con. Mining Co., was begun before a jury in the United States Circuit Court on Wednesday. This action was brought in July last to recover \$5,000. It is alleged in the complaint that on the 1st of February, 1880, and at various times subsequently, the defendant has intruded and entered upon certain drifts and cross-cuts of plaintiffs in Mono county and extracted 20 tons of ore, valued at \$5,000, therefrom. Defendant, in its answers, denies that plaintiff is the rightful owner of the premises on which the alleged unlawful entry was made.

## New Ore Washer.

A patent has recently been granted to S. P. Speers, of Baltimore, Md., for an ore washer which has some peculiarities. It consists of certain mechanism for conveying the gravel or ore up a series of inclined troughs, while subjecting it to the action of a current of water, combined with a series of settling tanks or chambers to receive the float gold or lighter flakes of metal.

The gravel or ore is delivered into a hopper and falls upon a screen. Then the coarser portions that fail to pass through the screen are rejected, and pass off on to a table where the coarse gold or nuggets are extracted. The portion which passes the screen falls through a spout into the first conveyer trough and is carried by the conveyer upward against a stream of water that is delivered from pipes, until it reaches the top of the conveyer trough.

It then descends through another trough to the bottom of the next conveyer of the series, and so on until the sand or refuse from which the gold has been extracted is delivered on a belt. This belt has cleats at its sides, and is provided with overlapping ends. The heavier portions of gold collect at the bottom of the conveyer troughs, and are removed from the pockets by opening certain slides specially provided.

The lighter particles are carried over by the overflow into a tank and subside in its various compartments, according to their weight, the gold being subsequently reclaimed from the earthy matters by means of amalgamation.

V-shaped partitions are placed between the troughs, and subserve an important end, in that as the area enclosed between them increases toward the top the effect of the upward current is diminished near the surface, and its power to carry over the light particles of gold with the refuse matter is proportionally diminished. This device merits the attention of mill men.

**CHINESE AND NEGROES.**—The *Herald*, in reviewing the late census statistics, finds that while the increase of the black population of the 15 Southern States, during the decade preceding 1870, was only 53%, the increase during the last 10 years was more than 35%. Regarding the increase in different States, the *Herald* says: "In Nevada they have increased, since 1870, from 3,152 to 3,420; in Colorado, from 7 to 610, of whom about one-third are in Denver; in Washington Territory, from 234 to 3,182; in Wyoming, from 143 to 914; and in Dakota, from none to 238. In Idaho and Montana there has been a marked falling away of Chinese, the decrease being from 4,274 to 3,378 in the former Territory, and 1,949 to 1,737 in the latter. New York city, which had just a round dozen in 1870, now musters 747, while Philadelphia, which started 10 years ago with precisely the same number as New York, can only show 80. Kings county enumerates 118, which may be taken as the approximate number of Chinese laundries in Brooklyn. Even New Jersey has 176 Mongolians within its borders, while Massachusetts has 237, and Connecticut 124. It is probable that New Orleans has attracted 473 to Louisiana, but St. Louis has drawn less than a hundred to Missouri."

The Bodie stage, says the *Carson Appeal*, brings in large quantities of bullion daily, yet the stocks of the mines which produce it are selling at figures which scarcely cover the cost of surface improvements.

### Silver in Sedimentary Rocks.

The following paper was read by A. W. Jackson at a recent meeting of the California Academy of Sciences, in this city:

Widespread interest has recently been developed in the subject of the occurrence of silver ores in sandstones and related sedimentary rocks, by the success which has attended the development of the famous Silver Reef mines in southern Utah. These mines ship regularly between \$70,000 and \$80,000 worth of bullion per month, most of which is derived from ores taken from two or three strata of sandstone, a rock, which, like most sedimentary rocks, is continuous over many square miles of territory.

This, certainly, must seem passing strange to the Pacific coast miner, who has been accustomed to consider that if there is any place where ores of the precious metals are *not* to be sought, it is in the sandstones and related sedimentary rocks.

The question is at once suggested: If precious metal is found in the sandstone of Utah, may it not be found in the sandstone of other districts? Has the prospector, who has, with such untiring energy, explored the most inaccessible recesses of our highest mountain chains in search of silver and gold, entirely overlooked a source of wealth which may be hidden in the monotonous sedimentary rocks of our plains and valleys? Finally, is there any practical consideration which guide the prospector which can tell him that in one locality he would seek fruitlessly for gold or silver, while in another he may hope to find it?

I think it can be shown that there is.

To the miner these are intensely

#### Practical Considerations.

If argentiferous and auriferous ores are to be sought indiscriminately in all of our sedimentary rocks, then there is scarcely an acre of the surface of the dry land but must be investigated, to prove either the presence or absence of ore. I am the more desirous of presenting a few thoughts on this subject for two reasons. On the one hand, prospectors have more than once recently sent sedimentary material to the geological department of the University, with a query as to whether ore deposits of the precious metals might be sought in them. On the other hand, one of the leading geologists of the country, Prof. Newberry, of Columbia College, N. Y., has announced a theory of the formation of the silver sandstone deposits at Silver Reef which, pushed to its legitimate conclusion, would necessitate the investigation, as I said before, of almost every acre of sedimentary rock in every country before the miner could be satisfied that gold or silver did not exist in it.

Now, I am aware that geology is far from being an exact science; furthermore, that that particular portion of it which deals with the genesis of ore deposits is one of the least understood. It is truly astonishing, when one reflects, that some of the fundamental principles of an industry which yearly adds hundreds of millions of dollars to the wealth of the country, should be so little understood.

However, while it is true that we know comparatively little about the

#### Genesis of Ore Deposits.

Still, we are not altogether in the dark. In almost every mining district, there are certain empirical laws which guide the miner in that particular district, but which are totally inapplicable, or at least not necessarily applicable, to any other district.

The laws of the occurrence of gold and silver, which are of general application, are exceedingly few.

#### The Typical Mineral Vein.

The "true fissure vein," as it is very properly called, is very simple in its structure and geological relations. It consists, essentially, of a fracture or fissure of a rock, varying from a fraction of an inch to many feet in width, of moderate length, rarely more than two or three miles, and of indefinite depth. This fissure becomes subsequently filled from side to side with ore and veinstone, probably introduced in the form of solutions from below. Very little obvious connection between the neighboring rocks and the contents of the fissure is observed. The bulk of the ore is confined almost entirely between the two walls of the fissure. It is often noticed, however, that the ore wanders out laterally into the wall rocks in sufficient quantities to render them worth mining and, to a much less extent than this, even to very considerable distances. This takes place, too, under circumstances where the conditions would seem to be exceedingly unfavorable, as in solid granite and similar rocks.

Special attention is called to this lateral impregnation of the country rocks, as it has an important bearing upon the genesis of the ore in the sedimentary deposits. The essential

#### Characteristics of Fissure Veins

Are, then, indefinite extension in depth, very moderate width (or thickness) and length, and subsequent formation to the inclosing rock.

The structure and geological relations of sedimentary rocks are in many respects quite the reverse of these. Take sandstone as a typical instance. It generally exists in the form of a widely extended horizontal deposit, covering many, often hundreds of square miles, and varying in thickness from a few feet to thousands of feet. Other stratified rock often lie both above and below it, and it is always younger than the underlying, and older than the overlying material.

Suppose such a body of rock to be impreg-

nated with silver ore more or less throughout its whole extent; you at once comprehend the vast difference in mode of occurrence between such an ore-body and the typical mineral vein previously described.

Such in general is the mode of occurrence of the ore at Silver Reef, Utah. I am indebted to Prof. Newberry and to Mr. Rolker, for several years and until quite lately Superintendent of the Stormont mine, for the facts concerning these mines; particularly to the latter gentleman, who has recently communicated a paper to the American Institute of Mining Engineers, upon the Leeds district mines, which was abstracted from the S. F. MINING AND SCIENTIFIC PRESS, December 25, 1880. I have not been able to consult Mr. Rolker's original paper, but have been compelled to content myself with the above-mentioned abstract.

I will not present a detailed description of the entire district and deposit, but will suggest only such points as bear more immediately upon the question to be discussed; namely,

How did the Silver get into the Sandstone?

Let it be remarked right here, however, that no one can pretend to furnish a complete solution of the problem in all of its details without a most minute and accurate knowledge of every detail of structure and relation presented by the deposit in place. Such a knowledge can rarely be acquired at second hand, nor can it be attained even by investigation in the field, until the mines have been much more thoroughly opened than is the case at the present time. These mines have been prospected to the depth of only — ft. The Comstock lode has been pierced to a vertical depth of nearly 3,000 ft., and scientific men are to-day unable to demonstrate precisely how the ore came into its present position, and where it came from.

The temptation to hasty generalization from insufficient data is, perhaps, no where so great as in geology. Instances without number can be cited where

#### Theorists have Fallen into Error

By drawing hasty conclusions from too few, or imperfectly observed facts. I would prefer altogether to await the accumulation of observed facts and let them explain themselves, as they always will sooner or later, if properly recorded and collated. However, the average modern investigator in almost every department of science has found it necessary to have constantly in mind what he calls a "working hypothesis" concerning the subject under investigation, which is to him the most rational of the many explanations of the phenomena in question which suggest themselves. Since we must have these hypotheses, it behooves us (particularly where practical considerations of great moment are involved, as in mining) to see that our hypotheses rigidly conform to observed facts, and that, as soon as this is not the case, we discard them for less objectionable ones.

It is in this spirit that we approach the present question, fully aware that at this distance from the field, and with the few data in hand, a complete solution is impossible, but believing that at least a rational choice from the two or three proposed hypotheses can be made.

To return, then, from this digression to the facts of the case.

#### The Silver Reef Mines

Are situated in extreme southern Utah. The sandstone containing the silver ore is of triassic age, as recently determined by Prof. Newberry. They are not to any extent metamorphosed from their primitive condition. There are two silver-bearing sandstone strata or "reefs," as they are called, overlying each other but separated by beds of clay shale. The ore, which above water line is mostly horn silver, and below it silver glance, is not homogeneously distributed through the entire rock, but is largely concentrated in ore-channels, lying one above another in the different beds. Organic remains of plants, partially or wholly converted into ore, are very plentiful; they make up, perhaps, the bulk of the ore, although it is distinctly stated by Mr. Rolker "that he had mined portions of these beds for a stretch of 200 consecutive ft., which were absolutely devoid, to the eye, of organic remains, and yet yielded an average of \$30 per ton.

On the other hand, organic remains are plentiful in sandstone layers quite free from ore, but overlaid and underlaid by sandstone free from fossils and full of good ore. Mr. Rolker also cites another instructive instance where a layer of 2 ft. of \$30 sandstone, which itself lies upon 15 inches of barren rock, under which the sandstone again carries \$20 ore.

Further, at Silver Reef comparatively little copper is found, while farther south copper enters largely into the ore, and in the same triassic sandstone on the west flank of the Nacimiento mountains in New Mexico, the silver gives place entirely to copper.

Prof. Newberry finds that the extension of these sandstones into the table lands to the east of Silver Reef, and along Cedar mountains as far north as Beaver, all contain silver, though rarely more than seven or eight ounces per ton.

Finally, in the words of Mr. Rolker, "the Silver Reefs are, where the silver is mostly concentrated, in close proximity to former volcanic centers; as is likewise the case at another less known locality, viz: at Virginia City on North Creek."

These, then, are the facts which we have to interpret. How did the silver get into the sandstone?

#### Several Theories

Have been propounded. Prof. Newberry thinks

that "the silver, like the copper which the sandstones contain, was deposited with them, and not introduced subsequently."

Mr. Cazin, of New York, takes exception to this and thinks that "the ore deposits both of copper and silver in the triassic sand-rocks, are precipitations from solutions containing metals, upon animal and vegetable matter, such matter, and not the metallic ores, being contemporaneous with the deposition of the sandstone." This is really, however, one of the possible interpretations which can be given to Prof. Newberry's statement of the case.

The usually accepted theory is that the metal solutions come from below, and are dependent upon, and immediately subsequent to, the eruption of igneous rocks in the vicinity of the present deposits. The hot springs bringing the metal solutions are the last dying manifestations of subterranean activity.

Let us examine these theories in the order indicated.

It is unfortunate that Prof. Newberry's opinion is not couched in specific language. It was probably not intended as a scientific statement, as it was contained in a personal letter to the President of the Stormont mining company, published in the *Engineering and Mining Journal* of October 23, 1880. It is susceptible of two or three quite different interpretations, possessing in common only the fact of contemporaneity of deposition of the inclosing sandstones. I will give first the most natural one and the one which I think he intended, viz: that the ores were precipitated out from solution in the ocean, at the bottom of which the sandstones were formed. The only ground for this view given by Prof. Newberry, is his discovery of copper and silver in the same triassic sandstones in the table lands to the east, and as far north as Beaver.

Now, on the one hand this comparatively widespread impregnation can be equally well explained by another theory, while on the other hand the theory itself seems to be unable to explain already observed facts. Conceding for the moment that the theory is the true one, there are two ways by which this precipitation could be effected, viz: by separation, caused by over concentration of the triassic ocean, or by reduction out of a far less concentrated solution by means of organic matter.

I find it hard to believe that Prof. Newberry would have us accept the first method. It would be like asking us to believe that the Pacific ocean, or any considerable area thereof, was made up of a concentrated solution of blue vitriol.

Mr. Rolker urges against this view that it would necessitate the existence at the present time of an homogeneous mechanical impregnation of the entire triassic sandstone covering hundreds of square miles in Utah, New Mexico and Colorado, while, as a fact, we find the most of the ore locally segregated, and but a small amount at distances removed from these local segregations. This objection is not a valid one, as it is quite possible for the local segregation to have been entirely subsequent to the original deposition of the ore and sandstones. One certainly could not explain upon this hypothesis, however, the peculiar form in which this local concentration is at present found, viz. in ore channels lying over each other in the two beds.

It is likewise difficult to conceive how the alternation of sandstone layers, rich in silver, poor in silver, and free from silver, as described above, could be explained upon this hypothesis. We should have to suppose the superincumbent ocean to be alternately exhausted and resupplied several times, or else, that later, the ore in the now barren sandstone was leached out and concentrated in the next lower bed. The first supposition is, to say the least, a strained one; and as for the second, there certainly appears to be no good reason why such a leaching process, if it took place at all, should favor narrow zones of but 15 inches thickness, and not be general over the entire sandstone bed.

Again, there seems to be no adequate relation between the amount of ore existing in the sandstones and the amount of copper and silver salts required to saturate an ocean to the point of deposition.

Finally, the fact that the Silver Reef region contains almost exclusively silver ores, while farther south it becomes largely replaced by copper, and again still farther to the southeast in the triassic sandstone of the Nacimiento mountains, in New Mexico, the silver gives place entirely to the copper, seems to me fatal to the hypothesis. I do not see how a subsequent separation of copper from silver over such an extensive area could be brought about.

Without denying, however, that in the progress of chemical geology the chemical possibility may be established, it must at least be acknowledged that at the present day it looks like an arbitrary assumption.

The second method of deposition above indicated, viz:

#### Reduction by Organic Matter

Out of a sea very far below the point of saturation is an altogether more rational assumption. We are quite prepared to believe that a minute proportion of silver existed in the waters of the triassic ocean, inasmuch as it appears highly probable, although not yet directly proven, that copper and silver exist in the sea water of the present ocean in exceedingly minute quantity.

Now, while organic matter would unquestionably reduce the ore even from exceedingly dilute solution, my principal objection to this

view of the question is, that in an ocean made up of such a dilute solution, there would be even far less probability that most of the copper would be reduced in one portion of the sea-bed, as at the Nacimiento mountains, while most of the silver was deposited in a different portion of the same sea as at Silver Reef.

Ocean currents would certainly bring about a comparatively homogeneous composition to the whole body of water, necessitating a chemically homogeneous impregnation of copper and silver over the entire triassic area; and as I have said before, I do not see how the copper and silver could subsequently become differentiated. But again, conceding this to be possible, neither of these theories would explain why the ores in the two or three principal localities (Silver Reef and Virgin City, Utah, and on the west flank of the Nacimiento mountains, in New Mexico,) should become concentrated in the vicinity of eruptive rocks and, so far as we yet know, there only.

Mr. Cazin advocates essentially this theory of reduction by organic matter out of an ocean containing an exceedingly small amount of copper and silver. He modifies it, however, by assuming that the deposition of the organic matter only, was contemporaneous with the formation of the sandstones, which organic matter became gradually converted in ore by exposure during thousands of years to the waters of the superincumbent ocean percolating downward through the subsequently formed and forming sandstone.

The theory even thus modified, is open, however, to all of the objections above stated.

The only remaining interpolation that can be given to Prof. Newberry's language (and this, in my estimation, is the most plausible of all) is, that the ore particles are the result of the

#### Mechanical Disintegration of Pre-Existing Ore Deposits.

Just as the grains of quartz in the sandstones are the result of the mechanical disintegration of pre-existing silicious rocks, or that the ore grains thus originally formed by mechanical disintegration became subsequently oxydized into sulphates, and again reduced to sulphides by the organic matter in the sandstones.

A fatal objection to the first process (as indicated by Cazin) is that the difference in specific gravity between the ore grains and the sand grains would inevitably lead to the mechanical segregation of the ore, in comparatively restricted areas. Furthermore, the ore particles are not rounded or water worn, but have evidently been formed just where they are now found, proven also by the plant remains converted into ore, which would not bear transportation and preserve their form.

The second process, viz: Oxydation to sulphate and subsequent reduction by organic matter would obviate the objection that the ore particles are not rounded, but would certainly not, that founded upon differences of S. G., although such a process would certainly admit of a far more extensive impregnation of the sandstone than the purely mechanical theory.

Further, we have the testimony of Mr. Rolker, that the mountains in the immediate vicinity of these deposits have as yet revealed no ore bodies to the industrious prospector, while the nearest vein deposits situated to the north, contain gold and lead with the silver. Rolker pertinently asks if the ores are derived from this source, why do we not find lead or gold with the silver in the sandstones?

Finally neither of these theories explains the occurrence of the ore in channels previously described, nor the concentration in the neighborhood of eruptive rocks.

There being, then, valid objections to all of the theories thus far suggested, let us turn to the last and most generally accepted theory, viz: That the

#### Metallic Solution Came from Below.

And were dependent upon and immediately subsequent to the eruption of the igneous rocks in the neighborhood of the present deposit.

In the first place, let it be noted that this is substantially the theory ordinarily accepted for the formation of true fissure veins, so that if it can be made equally applicable to such deposits as these under consideration, there would be a certain amount of presumption in its favor even if other things were equal. As fast as a hypothesis becomes gratuitous in science, it is eliminated—it becomes unnecessary. Not that nature always produces the same effects in precisely the same way. Too close adherence to this idea has frequently led into error. The only safe test is for each specific case to bring our theories to the ordeal of a satisfactory explanation of observed facts. In the present instance I fail to see a single fact which cannot be explained upon this hypothesis.

In the first place the igneous rocks are in close proximity to every locality where ore in paying quantities has been discovered.

It explains the occurrence of the ore in schuttes or ore channels, one above another in different beds. The eruption of igneous rocks could not fail to fissure more or less the adjacent sedimentary rocks. The solutions which followed, bringing the silver and copper would come through these fissures, and would, of course, deposit the greater portion of their metallic contents in and near the fissures which now form the ore channels. It would explain the alternation of rich and barren zones in the sandstone. We know that solutions will travel in channels, offering the least resistance. The layers richest in ore will be such channels and in proportion as the

(CONTINUED ON PAGE 118.)

## MECHANICAL PROGRESS.

## Rotary Cutters for Metals.

It would seem, to the experienced machinist, that the manners, and methods and means of working metals could have been reduced to an exact science. The planer, the lathe, the drill, the shaping machine, the milling machine, and other general and special tools are usually considered to have covered the ground of reducing and sizing metallic objects; the abrading and abolishing of the work being relegated to another branch.

But somehow the different manipulations on and processes of working metals seem to be so intimately connected that in many instances one department and one method overlaps and engages with another.

It is hard to point out the dividing line between turning (cutting) and finishing and polishing; it is difficult to determine where drilling and milling are separate; to say what difference there is in the resultant action of the shaping-machine and the profiling machine, although one acts with a fixed cutter and the other with a rotary cutter. The result of file finishing and corundum, or emery, finishing may show apparent difference to the mechanical eye, but the object sought may be equally gained by one method as well as by another.

The uses of these natural abrading materials are yet in their infancy. To make a turning or planing tool requires stock—the best of steel—and hard labor, and dulness and wear of the cutting edge requires additional labor and considerable skill to put the tool in shape again. Whereas, the emery wheel is a constant, requiring only occasional dressing, easily made. It is noticeable that most of the improvements in the working of metals could drift toward the application of rotary contrivances, and that the emery wheel is largely superseding the chisel edge and the serrated edge, as represented by the turning and planing tool and the file. In fact, the milling machine has stolen a large share of old time lathe, planer and vise work, and almost rules in the shop, its control being shared by the stone and emery wheel.

All this movement is in one direction, and it is not surprising that advanced mechanics insist that the movement has not reached its maximum. These improvers assert that a large amount of the work now done by the lathe and the planer with fixed tools should be done by modifications of these machines with rotary tools; and recently an ingenious and progressive mechanic has given proof of the advantages of substituting rotary for fixed cutters in the lathe and on the planer. His idea is to use mills of small diameter in place of the cutters in general use. A quotation from his own statement is better than a synopsis of his plan.

"All fixed and stationary cutting tools are merely chisels, driven either by percussion or by pressure; the percussion must be regular and equal or the work will be ridgy and 'chattered.' The pressure must be uniform, a condition impossible where the object to be turned is suspended on centers, which allows more or less recess on from the cutting point as the circumferential resistance is greater or lesser. But with a rapidly revolving cutter there is no time for recovery from the attack of the abrading cutter, and no chance of any projection or prominence overcoming the attack of the tool. So on the planer the spring and 'action' of the fixed tool leaves the surface in a series of transverse ridges; the finishing cut being only a reduction of this fault but not a removal of it. There is no planed surface but is a series of ridges; no smooth surface is possible with a fixed tool in a planer head. So in the lathe, it is impossible to turn a journal except its surface be left in ridges, which cannot be ground down and will not wear down. I insist that better work can be done on the lathe and the planer by rotary cutters than by any fixed cutter. The improvement will be as much as the sliding cut of the planer chisel over the percussion cut of the cold chisel. The only known means of producing an equal surface on metals is by a rotary motion. This is seen in our means of polishing and our methods of finishing. No true surface is expected by longitudinal or transverse motions. In either case the ridges must be removed by rotary motion. So in the lathe and the planer, the fixed cutter in one produces longitudinal ridges, and the other transverse ridges, to be removed after the work is done by rotary polishing or rotary wear. I claim that the only proper way of sizing metals is by rotary tools."

This mechanic has made some tests that appear to favor his plan. He rigged up a lathe with a rotary mill in place of the ordinary fixed chisel and turned a shaft of two and a half inches from the rough to size with one going over of the mill. The shaft was revolved at a rate somewhat less than for ordinary turning, and the mill driven by an overhead belt at as rapid a rate as it could stand, being fed with soda water.

The mill was only one and a half inches diameter with between 30 and 40 teeth, and was fed with a feed of about 30 to the inch. It should be stated that this was as rapid a feed as he could get on the lathe, and he thought a feed of 20 or 22 would give better results. The specimen showed excellent work, very true as to circumference and very smooth as to surface.

On the planer he introduced a similar mill in place of the chisel cutter, but he had to run his

planer at a lower speed than with the chisel cutter. The result, however, was very fine, a smooth surface apparently needing little more than ordinary stoning to make a good finish.—*Boston Jour. Com.*

## Saws.

The grand secret of putting any saw in the best possible cutting order consists in filing the teeth at a given angle to cut rapidly, and of a uniform length, so that the points will all touch a straight-edged rule without showing a variation of 100th part of an inch. Besides this there should be just enough set in the teeth to cut a kerf as narrow as it can be made, and at the same time allow the blade to work freely without pinching. On the contrary, the kerf must not be so wide as to permit the blade to rattle when in motion. The very points of the teeth do the cutting. If one tooth is a twentieth of an inch longer than two or three on each side of it, the long tooth will be required to do so much more cutting than it should, that the sawing cannot be done well. Hence the saw goes jumping along, working hard and cutting slowly. If one tooth is longer than those on either side of it, the short ones do not cut, although the points may be sharp. When putting a cross-cut saw in order, it will pay well to dress the points with an old file, and afterwards sharpen them with a fine whetstone. Much mechanical skill is requisite to put a saw in prime order. One careless thrust with a file will shorten the point of a tooth so much that it will be utterly useless, so far as cutting is concerned. The teeth should be set with much care, and the filing should be done with great accuracy. If the teeth are uneven at the points a large flat file should be secured to a block of wood in such a manner that the very points only may be jointed, so that the cutting edge of the same may be in a complete line or circle. Every tooth should cut a little as the saw is worked. The teeth of a handsaw, for all sorts of work, should be filed fleaming, or at an angle on the front edge, while the back edges may be filed fleaming or square across the blade. The best way to file a circular saw for cutting wood across the grain is to dress every fifth tooth square across and about one-twentieth of an inch shorter than the others, which should be filed fleaming at an angle of about 40°.

**ANOTHER DEPARTURE IN LOCOMOTIVE BUILDING.**—There seems to be an inclination of late to depart from the long existing and uniform style of locomotive building. We have already described a locomotive with a double set of driving wheels, the one over the other, the lower ones being actuated by friction; and here comes the description of still another departure, which we clip from a cotemporary: A locomotive of rather unusual shape is building at the Concord railroad repair shop at Concord, N. H. The boiler, instead of being round is flat—some 2 ft. thick by 7 ft. wide and 12 ft. long—the tubes running horizontally; this boiler rests over the fire-box and in the middle of the locomotive, the engineer's position being in a little cab, similar to a wheelhouse on a steamer, at the forward end, while the fireman's position is at the opposite end as now, the whole "machine" being considerably longer than the largest used at present. The inventor is a young man, by the name of Stevens, whose name this novel locomotive will bear. The greatest idea is the economy of fuel, the boiler being flat, and covering over so much of the fire-box, while the water will in no case be to any great depth as now. The invention was shown by J. H. Pearson, one of the largest shareholders, who was so pleased with it that he made arrangements to have one built for trial. It will be several weeks before this engine will be finished, and should it meet the expectations of its friends it will be quite a departure from the present style of locomotive.

**WATER POWER AND STEAM.**—The partial or entire discarding of water power by a large number of Northern and Eastern manufacturers is one of the industrial features of the hour. Favorable sites where a fall of water could be secured, led to the foundation of the most important of the New England industrial centers, but as time has gone on the power available has been found insufficient in itself and steam manufacturing has sprung up in the vicinity. This has been the case at Paterson, N. J., Lowell, and numerous other localities we could enumerate. Manufacturing operations have now attained a magnitude that renders absolute dependence on a supply of water subject to the drouth of summer or congealing in winter out of the question, being a source of constant loss. Hence, steam is everywhere in the ascendant, either as a supplemental or exclusive agent of power. Steam, unlike water power, has no assignable limits, and the means of further economizing its application are assiduously sought out with its more exclusive use; yet water power will always be a factor of value, and the great West still offers magnificent sites to which manufacturers are flocking to undergo the same experience of the more populated Northern and Eastern States.

**POTTERY IN THE UNITED STATES.**—There are now 500 potteries in the United States, the total products of which supply 50% of the wares annually consumed, the chief centers of the industry being Trenton, the capital of New Jersey, and East Liverpool, in Ohio.

## SCIENTIFIC PROGRESS.

## The Influence of a Tuning-Fork on the Garden Spider.

Having made some observations on the garden spider which are I believe new, I send a short account of them in the hope that they may be of interest to the readers of *Nature*.

Last autumn, while watching some spiders spinning their beautiful geometrical webs, it occurred to me to try what effect a tuning-fork would have upon them. On sounding an A fork and lightly touching with it any loaf or other support of the web or any portion of the web itself, I found that the spider, if at the center of the web, rapidly slow round so as to face the direction of the fork, feeling with its fore feet along which radial thread the vibration travels. Having become satisfied on this point, it next darts along that thread till it reaches either the fork itself or a junction of two or more threads, the right one of which it instantly determines as before. If the fork is not removed when the spider has arrived it seems to have the same charm as any fly; for the spider seizes it, embraces it, and runs about on the legs of the fork as often as it is made to sound, never seeming to learn by experience that other things may huzz besides its natural food.

If the spider is not at the centre of the web at the time that the fork is applied, it cannot tell which way to go until it has been to the centre to ascertain which radial thread is vibrating, unless of course it should happen to be on that particular thread or one stretched supporting thread in contact with the fork.

If when a spider has been enticed to the edge of the web, the fork is withdrawn and then gradually brought near, the spider is aware of its presence and of its direction, and reaches out as far as possible in the direction of the fork, but if a sounding fork is gradually brought near a spider that has not been disturbed, but which is waiting as usual in the middle of the web, then instead of reaching out towards the fork the spider instantly drops—at the end of a thread of course. If under these conditions the fork is made to touch any part of the web, the spider is aware of the fact and climbs the thread and reaches the fork with marvelous rapidity. The spider never leaves the centre of the web without a thread along which to travel back. If after enticing a spider out we cut this thread with a pair of scissors, the spider seems to be unable to get back without doing considerable damage to the web, generally gumming together the sticky parallel threads in groups of three and four.

By means of a tuning-fork a spider may be made to eat what it would otherwise avoid. I took a fly that had been drowned in paraffin and put it into a spider's web and then attracted the spider by touching the fly with a fork. When the spider had come to the conclusion that it was not suitable food and was leaving it, I touched the fly again. This had the same effect as before, and as often as the spider began to leave the fly I again touched it, and by this means compelled the spider to eat a large portion of the fly.

The few house-spiders that I have found do not seem to appreciate the tuning-fork, but retreat into their hiding-places as when frightened; yet the supposed fondness of spiders for music must surely have some connection with these observations, and when they come out to listen, is it not that they cannot tell which way to proceed?

The few observations that I have made are necessarily imperfect, but I send them, as they afford a method which might lead a naturalist to notice habits otherwise difficult to observe, and so to arrive at conclusions which I in my ignorance of natural history must leave to others.—*C. V. Boys, in Nature*.

**THE CURRENT OF RIVERS.**—A very slight dexterity suffices to give the running motion to water. Three inches per mile in a smooth, straight channel gives the velocity of about three miles an hour. The Ganges, which gathers the waters of the Himalaya mountains, the loftiest in the world, is, at 100 miles from its mouth, only 300 ft. above the level of the sea, and to fall 300 ft. in its long course, the water requires more than a month. The great river Magdalena, in South America, running for 1,000 miles between two ridges of the Andes, falls only 500 ft. in all that distance. Above the distance of 1,000 miles, it is seen descending in rapids and cataracts from the mountains. The gigantic Rio de la Plata has so gentle a descent into the ocean that, in Paraguay, 1,500 miles from its mouth, large ships are seen which have sailed against the current all the way by the force of the wind alone—that is to say, which, on the beautiful inclined plane of the stream, have been gradually lifted by the soft wind, and even against the current, to an elevation greater than our loftiest spires.

**A NEW ILLUMINANT.**—Herr Kordig, a Hungarian, has lately been performing some very curious experiments at scientific meetings in Paris with a new volatile combustible essence, which is offered for lighting purposes. Having arranged on the table several lamps in which the essence burns with a beautiful bright flame, Herr Kordig pours a quantity of the liquid on his hat and lights it, whereupon a long flame springs up to the ceiling. To the surprise of

the audience, he puts his hat on his head and waits till the flame goes out. The hat is then shown to be intact. He pours some of the liquid on the floor and on a handkerchief and lights it. The floor and the handkerchief are noways damaged. Some drops may be put in the hollow of one's hand and burnt without producing appreciable pain. These extraordinary facts are easily explained. Herr Kordig's mineral essence boils at about 35° C., and the tension of its vapor is considerable, so that it is not the liquid that burns, but its vapor. He states that the liquid is a very volatile essence of naphtha, with a certain mixture of ether of its composition added. The new essence is said to be obtained quite simply from natural oil seeds recently discovered in Hungary, and the cost is low. The liquid has a slight smell of petroleum, and produces on the hand a cold sensation like ether.

**A NEW PROPERTY IN SELENIUM.**—M. Blondlot has communicated the results of some investigation on a new property of selenium, which is of timely interest in view of the famous researches of Bell and Tainter. M. Blondlot finds that when a piece of annealed selenium is connected to one pole of a Lippmann capillary electrometer, by means of a platinum wire, and a plate of platinum is similarly connected to the other pole, a comparatively powerful electric current is developed by rubbing the selenium against the platinum plate, as is shown by the deflection on the electrometer scale. Mere contact between the selenium and the metal produces no deviation from the zero; but the act of rubbing readily gives an electromotive force equal to that of a sulphate of copper cell. As if to take the effect still further out of the category of those already recognized, M. Blondlot has verified the facts that neither the rubbing of two metals against each other, nor an isolating substance against a metal, nor two isolating substances, can produce a change in the capillary electrometer. The current flows through the electrometer from the unrubbed to the rubbed surface of the selenium. Now a thermo-electric current set up by heating a selenium-platinum junction would, as M. Blondlot points out, flow through the electrometer from the hot selenium surface to the cold one, or in precisely the opposite direction; hence, the novel effect cannot be due to heat developed by the friction.

## THE ACTION OF CHLOROPHYL IN VEGETABLE

**GROWTH.**—The question of the use of chlorophyll in vegetable growth does not as yet appear to be definitely settled. Pringsheim, it will be remembered, recently suggested that chlorophyll was chiefly of use as a screen to protect the subjacent cells and their contents from those rays of light which would be adverse to the secondary processes that have been distinguished as growth. But Dr. Gilbert, in his recent address to the chemical section of the British association, points out that the plant may receive abundance of nitrogen, may produce abundance of chlorophyll, and be subject to the influence of sufficient light, and may yet not assimilate a due amount of carbon. He shows that the presence of a due supply of potassium salt and of sufficient available nitrogen is necessary for the proper assimilation of carbon by plants. The amount of carbon assimilated evidently does not depend on the protective power of the chlorophyll alone, nor on its chemical action. In connection with the coloring matter of leaves it has been observed that the leaves of the Virginia creeper change to the well-known, beautiful red hue sooner on walls exposed to the north and east, and that if the weather be wet during the time when they usually change color the red tint is only sparingly developed.

**THE VOICE OF FISHES.**—Some discussion has recently taken place in regard to voice in fishes. A correspondent to the *Scientific American*, writing from Parkersburg, West Virginia, says with reference to the note on the subject in a late number of that paper, that the white perch of the Ohio river will often follow a boat for a considerable distance, all the time making a peculiar humming noise like that of a telegraph wire in the wind. He has heard the fish make the same sound when imprisoned in a fish box to keep it alive.

**EGYPTIAN OBELISKS.**—There are 30 of them at the present time scattered over Europe. Rome has 11, four of which are higher than our New York obelisk. The highest of the Roman obelisks, which is also the highest in Europe, stands before the church of St. John Lateran. The obelisk in the piazza of St. Peter's is 82 ft. 9 inches high. Both of these were mounted on high pedestals. The pedestal of the St. John Lateran obelisk is 44 ft. high, making the entire height of obelisk and pedestal 150 ft. The pedestal of the St. Peter's obelisk is a trifle less than 50 ft. high, making the whole height of the monument 132 ft. 2 inches.

**AN ELECTRIC WATCH.**—A watchmaker at Copenhagen, of the name of Sonderberg, is reported to have made a watch which requires no winding up, inasmuch as it performs that work itself by means of an electric current. An electric magnet fixed inside the watch keeps the spring perpetually in a state of tension. All that is required to keep the watch running is to preserve the battery in proper working order, for which purpose one or two inspections in a twelve-month are said to be sufficient.

**BODIE DISTRICT.**—*Free Press*, Feb. 8: The Syndicate is still stoping ore from the Caeola vein, 300 level, but will probably run the mill on custom ore next month and resume work in the west crosscut, 950 level, to cut the same vein at that depth. The Standard Con. has made a regu-

lar boom in the hullion business. On Tuesday of last week it shipped \$59,943.26, and on Monday of this week \$131,935.27, and the average pulp assay jumped from \$49.74 to \$75.53. The west crosscut, 1000 level, is in favorable ground, and will probably reach the ore body within 10 days or 2 weeks. Bodie still holds its own, the ore milling about \$115 per ton. The Lent shaft is down 430 ft. and a second installment of heavy machinery is on the road near Bridgeport. The north drift, 600 level, of the Con. Pacific, is showing some fine silver ore. Toga is still driving the west crosscut, 922 level, and stringers of quartz and day are coming in. They ought to reach the vein inside of 2 weeks. In Concordia the Taylor vein is strong 70 ft above the 400 level, and the porphyry for several lodes each side of the vein is strongly mineralized, being coated with silver. The east or main Concordia vein is also improving in the north drift. In Boston Con., sinking for the 400 level has been commenced, the vein on the 300 level having proved to be a good one for a distance of 315 ft. Jupiter has started a new crosscut 230 ft south of the shaft, to prospect the favorable looking ground to the east of the south drift. The rich strike of the 512 level of Noonday is growing in importance. The winze following the foot-wall in this ore is down 35 ft, and on Monday a crosscut was driven 5 ft into the ore without the slightest indication of the near proximity of the hanging wall, the ore in the face of the crosscut being fairly as rich as at any other point. It will be remembered that the 512 level ore was 35 ft wide and of good quality. All the stopes in both Noonday and North Noonday are looking well. Goodshaw will clean up to-day (Tuesday) the result of a crushing of 95 tons of ore. The south drift, 600 level of this mine, is still being pushed, and the work of sinking the shaft will be commenced next week. The Champion has not yet commenced sinking, but will probably be in shape in a few days. The south drift is still sinking. Bodie Tunnel is shipping ore to the Miners' mill, the ore being taken from north and south drifts in the Festoon or No. 20 vein. Blackhawk is showing an improvement both in quantity and quality of ore in the winze from the west crosscut, 700 level, the winze being down 70 ft. The Spaulding mill will start up to-day on Spaulding ore, so that there will not be an idle stamp in the district.

## NEVADA.

**DEER CREEK.**—*Herald*, Feb. 14: The mines down Deer creek are now all running in full blast. The Providence, Merrifield, Mountaineer and Wyoehue and Spargo, are all making good showings. The Michel amalgamating pan, that is now in operation on the creek between the Providence and Merrifield mines, is showing better results since alteration was made in the regulation of the water power. The Charronnet mine, at Canada hill, continues to look as well as ever. The incline having been sunk 100 ft below the drain tunnel, drifting has been commenced both ways. The ledge, though a little smaller, yields very rich rock. About 120 tons are now lying on the dump, and will be hauled to the mill as soon as the water will permit. A fine specimen of this ore was on exhibition to-day at Isaac's store.

**A PAYING MINE.**—*Nevada Transcript*, Feb. 11: The little hydraulic claim formerly known as the Knickerbocker, and now owned by Messrs. Lindemeyer & Hottinger, which is situated just above Sargent & Jacobs' claim at Quaker hill, is a paying piece of property. A clean-up of \$2,002 has just been made after a run of 20 days with one monitor. The total expense of the run looks up to over \$350, leaving a net gain of \$1,650 for the owner, or over \$82 a day. The gold found there is worth \$19.41 an ounce.

**TRUE BLUE.**—Work at the True Blue drift claim, Mt. Oro, is progressing as favorably as could be expected during such weather as has been prevailing throughout the county for several weeks past. The new incline is already down 30 ft, and rapidly nearing the extensive and rich gold deposit exposed to underlie the ridge. The erection of the new hoisting and pumping works has been delayed on account of the roads being in such a bad condition as to prevent hauling the machinery up there. There is no likelihood that the pump will be required, however, till the cement has been tamped.

## PLACER.

**IOWA HILL.**—*Cor. Pacer Argus*, Feb. 12: Indian canyon never was so high, and the Orion Con. has had to stop washing and turn all their attention to the trestle which supports their pipe across the canyon, and which is ordinarily submerged beneath the tailings. Despite all their precautions part of it was swept away Saturday night, and the slides began to undermine the ridge. The erection of the new hoisting and pumping works has been delayed on account of the roads being in such a bad condition as to prevent hauling the machinery up there. There is no likelihood that the pump will be required, however, till the cement has been tamped.

## PLUMAS.

**ROUND VALLEY WATER CO.**—*Greenville Bulletin*, Feb. 12: On Saturday we visited the reservoir and made a careful inspection of the dam, as fears had been expressed by a number of persons that it might give way, in which case this town would be badly injured. The reservoir covers over 700 acres, and the water will probably average nearly 20 ft in depth. The dam is in every way safe and substantial, and the natural conformation is such as rendered it an easy matter to construct the dam.

**SOUTHERN EUREKA CON.**—The new 10-stamp mill is now completed. The engine was started for trial on Monday, and the clear, sharp whistle sounded plainly in town. The mill is completely ready to go to work, and is provided with 80 square ft of first-class silver plates. The chimney in the mine has just been reached, and the quality of ore developed is very superior. Supt. Bransford expects to have the mill under full headway in a day or two, and anticipates the most favorable results.

**CHEROKEE.**—Last Saturday we visited the Cherokee and Green Mountain mines, and witnessed some of the effects of the terrible storm. So much rain has fallen that the ground is thoroughly soaked, and on the steep side-hills there are numerous slides. For several hundred ft in length the earth loosens, breaks off from the hill and down goes the huge mass, carrying large pine trees with it, and uprooting them as if they were but dry twigs. Along the side of these steep hills, winding in and out the numerous canyons, is the ditch and flume of the Round Valley Water Company, which supplies the water for the Green Mountain mills. At 3 different places slides have completely destroyed away vestige of the ditch. In one place it was found necessary to turn across a canyon and build a flume, rather than dig out the buried ditch.

## SIERRA.

**NORTHERN SIERRA.**—*Mountain Messenger*, Feb. 12: The recent almost unparalleled severe rain storms in the Sierras have created havoc over the northern part of our county. George W. Swan, of the La Porte and Morris-town gold gravel hydraulic mining property, is putting the ground in working order, and, no doubt, will return good dividends to its lucky owners, as he is a sterling, good manager, which supplies the water for the Green Mountain mills. At 3 different places slides have completely destroyed away vestige of the ditch. In one place it was found necessary to turn across a canyon and build a flume, rather than dig out the buried ditch.

**NORRIS.**—The St. Louis monster water pipe, 34 inches in diameter, lately hurled, not yet repaired. At Gardner's Point all the ditches are full. Part of Col. Baker's flume is demolished, and the blocks are gone. At Port Wine, ahead manager, which supplies the water for the Green Mountain mills. At 3 different places slides have completely destroyed away vestige of the ditch. In one place it was found necessary to turn across a canyon and build a flume, rather than dig out the buried ditch.

the gravel banks blasted down last fall. Poverty Hill diggings are being worked under the energetic and able management of one of its owners, S. Kingdon, which has already been remunerative.

**HOWLAND PLAT.**—Supervisor J. K. Walls, who arrived last Sunday evening from Howland Flat, we learn that there is between 3 and 4 ft of snow at that mining camp, and near 8 on the ridge separating Slate and Canyon creeks. For 36 hours snow fell, followed by the same period of clear weather, succeeded by a 9 days' continuous rainfall, the longest ever known at that rather elevated level, 5,800 ft above the sea level, ending with about 2 inches of snow. It is estimated that more water fell than usually does in an entire winter season. All new snow has disappeared. The old snow is frozen hard, and will not turn water.

## NEVADA.

### WASHOE DISTRICT.

**CALIFORNIA.**—*Virginia City Enterprise*, Feb. 13: On the 2300 level the joint Ophir east winze has been connected with the upraise from the 2500 level. The joint Con. Virginia east crosscut has been advanced 21 ft. On the 2500 level the south drift from the Ophir line has been advanced 18 ft; the joint Ophir east crosscut has been advanced 18 ft, and the joint Ophir upraise connected with the winze from the 2500 level, and is now enlarging the winze to the full size of the upraise.

**UNION SHAFT.**—Sunk and timbered 10 ft; repairing the 1600 drift, and casing the timbers at the 1900 station.

**UNION CON.**—The joint Mexican east crosscut has been extended 30 ft, and the joint Sierra Nevada east crosscut 34 ft.

**MEXICAN.**—On the 2500 level the joint Ophir east winze has been sunk and timbered 21 ft, and the joint Union Con. east crosscut has been advanced 30 ft.

**HALE & NOKROSS.**—We lowered the cages on the 10th inst, the first time since the first. Miners are at work clearing away the broken stave and damaged cables. Work on the ore-house is progressing rapidly. This completes the construction work.

**CON. VIRGINIA.**—On the 2300 level the south lateral drift has been extended 13 ft. On the 2500 level the joint California west drift to the C. & C. shaft has been extended 32 ft.

**UTAH.**—During the past week the east drift on the 2150 level has been extended 24 ft. The ground is soft and working well. Work on the east drift, 1950 level, has been discontinued at a point 048 ft east of the incline. We are now engaged in cleaning out the sump, preparatory to sinking the incline for another level.

**SIXTH NEVADA.**—On the 2300 level the upraise has been advanced 30 ft; total length, 540 ft. On the 2500 level the north lateral drift has been advanced 55 ft; total length, 515 ft. During the week 99 tons of ore have been extracted, assaying from \$18 to \$103 per ton.

**OPHIR.**—On the 2500 level the joint Mexican east winze has been sunk and timbered 21 ft; the joint California upraise has been connected with the winze down from the 2300 level, and is now being enlarged and timbered.

**SUTRO TUNNEL.**—South Lateral.—The repair and header shifts have been at work during the week retimbering, easing timbers and repairing the drift near the face. One gang of men is employed, about 21 ft from the face, retimbering the ground and working towards the face. Another gang is engaged at a point about 43 ft from the face in retimbering, easing timbers and repairing towards the face. At present some hot water is flowing from the east side, which was probably dry when the drift was run. Sixty-one ft has been completed (retimbered, etc.), including 15 new sets. Total distance to the Yellow Jacket shaft, 976 ft. Flow of water in standard gallons, 3,612,900.

**YELLOW JACKET.**—The Suto tunnel level drift has been extended 50 ft during the past week, making the present length of some 340 ft from the switch, or 410 ft from our shaft. The ground continues full of clay seams, which makes it necessary to keep the drift timbered close up to the face. There is a slight increase in the quantity of water. We have again been delayed somewhat in work by the hoisting of water for 3 days, owing to a break in Belcher pump beams.

**CALIFORNIA.**—The pumps have been run an average of 21 hours per day, consuming 8 cords of wood per day. Have pumped water for the Belcher company the entire week. The Forman shaft has been sunk and timbered 15 ft; total length, 1,730 ft. The rock is very hard and short, and work is badly.

**OVERMAN.**—The east drift, 2275 level, has been extended 35 ft; total length, 280 ft. We have bailed water with the tanks 78 hours for the Belcher company. The Forman shaft has been sunk and timbered 15 ft; total depth, 1,730 ft. The ground continues very hard and short, and does not blast well.

**SAVAGE.**—Have been engaged during the past week in relieving timbers in incline, in repairing the drift south from the 10th level station, and in driving west on the 2100 level.

**C. N. S. SHAFT.**—Still engaged in bailing water and in putting in pipes for hydraulic pump.

**KENTUCK.**—Repairing the old shaft, preparatory to renewing operations in the mine.

**G. & C. AND E. & B. SHAFT.**—Excavating bob-pit and making excellent progress.

## BRISTOL DISTRICT.

**DAY MINE.**—*Pioche Record*, Feb. 12: A. S. Gould, Supt., informs us that on Monday he will ship sample of ore to Bullionville for the purpose of having them test it and see what they can do. There is no telling at what ancient period the Bristol mill will start up.

## CORTEZ DISTRICT.

**BULLION.**—*Silver State*, Feb. 9: S. Wenban, of Cortez district, near Beowawa, has struck another bonanza in his mine. Yesterday he shipped West, by express, 25 bars of bullion, valued at \$33,000. Mr. Wenban sticks to Cortez through ill and good report, and makes money by doing so, though experts who visited the district some time ago pronounced it worthless.

## CENTRAL DISTRICT.

**ENCINO ARROYO.**—*Silver State*, Feb. 8: S. W. Hammond brings very good news from the Central district. Several miners are at work on their claims, and taking out more or less ore. The Keystone mine, owned by R. V. Craig and C. W. Cook, is producing very rich ore, and considerable of it. They are down 180 ft on the ledge, and in one of the levels they have a ledge 14 ft wide, 8 inches of which will average \$200 to \$210.

**NORMAN GILBERT.** is at work on the Railroad mine, the largest ledge yet found in the district. The ore is principally argilliferous galena and antimony. This he roasts in a reverberatory furnace, and then treats it by the leaching process.

**THE MYRLE.** owned by S. W. Hammond, is the richest in the district. The ledge is small, seldom exceeding 1 ft in thickness, but it pays well. Assorted ore works about \$2,000 to the ton.

**J. F. CLARK.** is building a mill on the Humboldt to work the Loomis and Railroad ore. He has the frame of the building completed, and will probably get it in running order next spring. It is to be run by water power.

## DUN GLEN DISTRICT.

**CLOUGH.**—*Silver State*, Feb. 8: John Wright, of Dun Glen, informs us that the late rains washed out the road through Dun Glen canyon so badly that teaming is suspended. The Long Sync mine and mill are closed down for the present, and the Superintendent, Dr. Loomis, has gone west to purchase pumps and a hoisting engine. The mine is looking splendidly, and below the tunnel level the ledge is larger and richer than it has been above that level. To work it, however, it is necessary to get an engine to pump out the water.

## ESMERALDA DISTRICT.

**DEL MONTE.**—*Esmeralda Herald*, Feb. 12: On Saturday last the nose place of the balance-hob on 300 level broke and fell. This caused a delay of several hours, during which time the haulage was removed from this hob to the other two. The water came over the 800 level but was speedily lowered, and the pump handled it without difficulty.

culity assisted by one tank. Work in the drift on 800 level is progressing very favorably.

**EVA CON.**—Work progresses in the shaft. Ten ft have been accomplished this week, making its total depth about 50 ft. The ore has changed for the better, and in the bottom looks very well.

**CENTRAL.**—The work of developing this valuable property still goes on. Preparations for opening the mine thoroughly in the spring are being made.

## EUREKA DISTRICT.

**PREMIER.**—*Sentinel*, Feb. 12: The work of grading the ground for the machinery of the Eureka Con. still continues, and the ground will soon be ready for it. In the meantime work in the new shaft has been entirely suspended, and will not be resumed until the machinery is in position to control the flow of water.

**A DISPUTED POINT.**—Ever since Joe Potts vanguarded the Richmond with stink-pots the soul of Wm. Harris has been bent on revenge, and on Thursday night he proceeded to carry his cherished scheme into effect. All the articles generally used for such purposes were brought into requisition, and a stench powerful enough to have sickened his satanic majesty was driven toward the conclusion by the powerful air compressor of the Richmond. But the Albion folks closed the aperture, and the Richmond received the benefit. Joe Potts is now cock of the walk, and says if they propose to settle the disputed point with stink-pots they can count him in.

## GRANTSVILLE DISTRICT.

**THE CENTENNIAL.**—*Bonanza*, Feb. 12: Work on this mine goes on with increasing and flattering results. The entire shaft is in ore, and a careful examination of the bottom shows it to be of a better quality than any yet obtained, and further shows that the same improvement in quality is met with as depth is gained. There can be no question but that this company has just entered a large body of ore, and that in the next 24 ft rich developments are expected.

**THE ALEXANDER.**—In the Alexander the work goes steadily on, the slopes producing the usual quantity of ore. The work of sinking the incline progresses satisfactorily, and everything is in a prosperous condition.

**THE BROOKLYN.**—The Brooklyn continues to send out plenty of fine ore to run its stamps, and more if the stamps are in the mill. An incline will soon be started in the bottom to go for another level.

## LEWIS DISTRICT.

**MINER'S UNION.**—*Silver State*, Feb. 12: The miners in Lewis district, whose wages were reduced to \$3 per day and per week for board, have organized a Union. Following are the officers elected: Wm. Tophill, President; F. Bartlett, Vice-President; D. T. Holmes, Secretary; I. W. Finley, Treasurer; I. Knight, Warden; H. Roscoe, Financial Secretary; H. Darey, Conductor; M. McCormick, T. Baker and M. Roscoe, Financial Committee; James Tomahat, Outside Watchman. The officers were installed by a member of the Austin Union.

## PIOCHE DISTRICT.

**BULLIONVILLE WORKS.**—*Pioche Record*, Feb. 12: Work is being steadily pushed ahead on the furnace, which will soon be completed. Thiefturce, although a water-jacket, is very different from that erected by the Hillside Co., and is of an octagon shape. During the week the greater portion of the machinery in place has been tested, and one or two slight alterations will probably have to be made.

**THE 24th of January** was the time on which the Raymond & Ely Co. was to hold its annual election, but, as we have failed to hear anything about it, we presume that the unworthy Board of Trustees of that company failed to meet. We have the very best of reasons for believing that the property of the company will fall into the hands of Lazard Freres, and that the much talked of suit brought by Mr. Walker will probably be dropped; and as the French do say, then "We will see what we will see."

**HICK MILLS.**—Henry Raymond's mill is now all in readiness, with the exception of some slight articles, and the whistle, indicating its starting up, we to have been blown on Wednesday last. There is quite a lot of ore on hand.

## SILVER CANYON DISTRICT.

**RUNNING.**—*Ward Reflex*, Feb. 12: J. C. Campbell, who arrived from Silver canyon Monday last, informs us that Wm. Sheek, for a long time in charge of the 6-stamp mill at Cherry creek, is running Dr. Brooks' mill at Silver canyon. When Mr. Campbell left for Ward on the 30th of last month there was between 500 and 600 lbs of amalgam ready for the retort. One from the Sadie L. reaches the mill by the Blue Bell. When the snow goes off the Blue Bell mine will come to the rescue. Forty-three men are at work in the canyon.

## TAYLOR DISTRICT.

**ORE.**—*Ward Reflex*, Feb. 12: In the Selfcocker mine, Taylor district, Mr. W. R. Thomas informs us, a large body of first-class ore has been struck by McComie & Murphy, who are doing their best to get the claim. They are now sinking on it. The ore is of the same character that Garrothers & Garaghan shipped to Salt Lake for reduction.

## WARD DISTRICT.

**MARTIN WHITE.**—*Reflex*, Feb. 12: A small body of ore was cut in the 2900-ft crosscut in the Martin White tunnel Monday last. It looks like the top had been cut through and that there is a body of ore below.

## ARIZONA.

**PIONEER DISTRICT.**—*Pinal Drill*, Feb. 12: In the New-leader work is going on under contract, to sink 30 ft deeper, which will make the shaft 100 ft deep.

**TURNER.**—The Turner, formerly known as the Athens mine, is now worked at a depth of 76 ft in the shaft, and 33 ft in the tunnel. They have cut the vein in good ore.

**PIKE.**—The Pike mine is full of activity. The old shaft has been opened for exploration, and the lay of the metal ascertained so that a new tunnel is now under contract for 150 ft in length, and its mouth is on the low gulch, below the old tunnel. They will pierce the steep mountain at a great depth and open up a rich mine of silver-bearing galena ore, assaying nearly \$200 per ton.

**LEWIS.**—The work on the main tunnel is continued, and progressing rapidly. It is expected to reach the Lewis vein in 25 ft more. At 255 ft they are sinking a winze, which is now 9 ft deep, and all in good ore. In the tunnel the same rich ore is also found where they are now working. The assays of the Lewis run as high as \$1,200 per ton, and large quantities are in sight in the tunnel. The Lewis presents all the indications of a bonanza.

## IDAHO.

**WOOD RIVER.**—*Cor. Idaho Statesman*, Feb. 8: Several good prospects have been discovered near Bellevue since the snow fell. One claim, owned by John Walker and Thomas Hort, is being opened and shows a ledge of galena and cerussite about 4 ft wide, much of which will assay from \$300 to \$500 to the ton. This ledge is situated on the hill east of this place, and only about 1 mile from town. Several other claims on the same mountain are being worked with good prospects. Among them is the Town View, being worked by James Dillinger and others, who have leased it. They have several tons of ore already sacked out, and will yield from \$500 to \$700 per ton. These are the first claims that have been opened on the east side of town. Several small snow-slides have occurred in the mountain west of here and around Bullion, but, as yet, no one has been injured by them.

**A LUCKY STRIKE.**—*Yankee Fork Herald*, Feb. 14: The Andy Cremer tunnel right, situated a few hundred yards above Rocky Bar, Alturas county, was purchased by Resner & Settle and the vein was found on 300 to 400 ft long, 15 ft, where a 2-ft vein of ore worth from \$60 to \$100 was struck. Mr. Cremer had been at work on the tunnel for 17 years, and sold it for the insignificant sum of \$500. The vein tapped is supposed to be an extension of the Idaho

and Vishon mines. The Idaho and Vishon mines have been worked at different times, and immense quantities of bullion have been shipped from them. The mine was tapped by the tunnel at the depth of 300 ft, and there is enough ore in sight to keep a 10-stamp mill running for at least 2 years.

**CRUSHING COMMENCED.**—The Custer mill commenced crushing in earnest last Wednesday, and has been running night and day since, and will be successful in keeping pounding away without cessation. Everything is now working to a charm, and big clean-ups are looked for. The roasters are more than meeting the expectations of the builders, and the ore is being chloridized up to over 90% of the assay value. The bullion is 950 fine, which is high. The shipping of it will commence inside of a week.

**BOISE BASIN.**—*Jonas W. Brown, Esq.*, writes us in a private letter from Idaho City that there is now more snow throughout Boise basin than there was last winter, which insures a good placer mining season.

**YANKEE FORK.**—The usual force of 70 men will resume work in the Custer and Unknown mines in a short time. Most of them were "knocked off" a short time ago, all the ore houses, stopes, tunnels and every place being full of ore. The largest mine, which is on the Charles Dickens vein, is looking better than ever before. The sounds of blasts can be heard at any minute of the day, showing activity in all of the mines. The tunnel running to tap the Badger mine, on Custer mountain, is being pushed ahead with all possible speed. The mine is owned by R. C. Chambers and others.

## MONTANA.

**ANSELMO.**—*Butte Miner*, Feb. 8: The Anselmo continues to improve with the attainment of depth, and is one of the main mines of this district. Mr. Hughes, who prospect one year ago, is now regarded as a fortunate and valuable property. The east shaft is being steadily pushed to the deep and shows in the bottom a well defined ore body 4 ft wide and assaying across the vein \$250 per ton. The shaft is 210 ft deep. At a depth of 170 ft east and west drifts have been extended to a total length of 85 ft. The vein, though a ft less in width than at the 60 level, is producing a quantity of excellent quality, the sample last taken assaying \$180. The vein is being sunk as fast as the hoisting capacity of the winze will permit, and yesterday reached a depth of 150 ft. Before the end of the month it is the intention of the lessee, Joseph Lacaff, to have steam hoisting machinery in operation. The boiler has already arrived, and the engine and pump are en route from San Francisco.

**LEXINGTON.**—Although very little information concerning the Lexington finds its way into print, it is gratifying to know that the development of the mine is proceeding uninterruptedly, and that the results are of the most satisfactory character. For 3 years the Lexington mill has been running continuously and profitably on ore from the 80 level of the mine, and there are yet large reserves of pay ore available for extraction. For the past few weeks a new chute of ore not previously developed has been coming largely to the dry stack production. The new ore body is 6 ft wide, and is sufficiently rich to insure handsome returns.

**MOUTON.**—The main shaft yesterday attained a depth of 140 ft. The 2-ft "feeder" recently encountered has dipped south. Another one, showing equally rich ore, came into the shaft several days ago. Three shifts of men are employed, who sink between 24 and 3 ft per 24 hours. The hoisting works building is completed.

**BIG WORK.** continues on this property with an activity characteristic of the owners. The face of the east drift, from the bottom of the winze shaft, is being forwarded on a wide and well defined body of first and second class ore. The former is being sacked for shipment East, and the latter is left on the dump, where it will remain until the erection of the projected smelting works. From the winze, midway between the two shafts, on the 60 level, exceptional high grade silver-copper ore is being extracted which glitters with native silver, and is sufficiently rich in copper to pay all expenses of extraction, transportation and reduction. The necessary steam hoisting machinery will soon be imported and placed in position.

**ALICE.**—Supt. Hill is very well satisfied with the condition of the mine and the operations of the mill, though the latter is now being repaired, and the mine have not yet been perfected. The mine is now producing upwards of 60 tons per diem from the several levels. It is being mined on the ore floor in certain proportions, and excellent results in the way of fine bullion may be expected within a few days.

## OREGON.

**TWO MUCH WEST.**—*Democratic Times*, Feb. 4: S. C. Carter informs us that the ditch of the Grand Applegate Co. has been considerably damaged by the storm, and it will take much time and money to repair it. In some places not a sign of it remains, having been filled up with debris. The Squaw Lake Co.'s ditch is intact, however. Even the minor creeps and complaints of the superabundance of water for once. Ditches, dams, etc., have been damaged considerably in these instances, but the injury has generally been repaired soon and the work expended for a very short time only. At present writing nearly every miner in Jackson and Josephine counties is busy and improving his opportunity. A correspondent of the *Times*, under date of the 27th ult., says: "I think the water was higher in this section than we have any account of. The damage to the mine is light, but most of their ditches were damaged some of them. A. J. Fanky on Star Grove creek seems to be the heaviest loser. He built a breaker in the creek, in order to protect his works in the bank, but the water washed it out, with his flume, and filled up everything. His loss is put at \$250. He has gone to his farm in Sam's valley and will wait till spring to re-open his claim. The head of the Rising Star Co.'s ditch on Wolf creek was washed away. Damage about \$50."

**TUNNEL.**—Operations on Shumpp & Co.'s tunnel, in Willow Springs precinct, have been suspended for the present, but will be resumed at an early date.

**TAILINGS.**—The accumulated tailings of years have been swept from the dumps by high water, which has been a benefit to the miners who have often been discommoded by them.

**MINES.**—Since the organization of Josephine county 900 locations of quartz and placer mines have been made, the Galice Creek district heading the list with 264. The total number of transfers has been 239.

**NUOGOT.**—*Joia Saltmarsh*, of Youdas & Co., Sterling, picked up a neat nugget of gold, worth \$40, last week. The company is taking advantage of the water supply and making the dirt fly, as are others on the creek and elsewhere.

**NORRIS.**—Miners busy. Plenty of water everywhere. K. Boze is mining some new diggings near his place on Applegate with good success. Beck Bros.' dam on Applegate has again been washed out, but, with commendable pluck, they will try it over again. Barkdell & Kline, at Blackwell, are now working placer diggings, but will resume operations on their quartz ledge early next summer.

**FROM THE MONTANA.**—*Democrat*, Feb. 4: The Supt. of the firm of Back & Block of this city, returned from a trip to the Granite creek country last Monday. He visited the Monumental mine, and on his return Mr. Chas. Miller, superintendent, entrusted him with the care of two silver bricks, one valued at \$1,874 and the other \$1,801, to be brought to this city and shipped to the smelting works at San Francisco. Mr. Back reports the mines generally in that section in a flourishing condition.

## UTAH.

**PARK CITY NORRIS.**—*Salt Lake Tribune*, Feb. 12: The smelter will start up about the 15th of February. The Ontario company contemplate sinking a new shaft on the Last Chance ground, on the hill west of the present works. It will be larger than the present new shaft, to accommodate the monster Cornish pump which will be put in. The strike in the Rebellion is improving rapidly. The raise has been run over 90 ft, in ore all the way.

## Silver in Sedimentary Rocks.

(CONTINUED FROM PAGE 114.)

physical or chemical conditions for absorption are unfavorable in the same proportion will the rock be poorer in ore.

It would explain the preponderance of silver in one portion of the triassic sandstone, and of copper in another portion; viz., they came through different fissures and from different sources below.

It would explain the impregnation of the sandstones even at considerable distances from the larger bodies of ore. I have already cited the common occurrence of lateral impregnation of the country rock on either side of fissure veins. In the same way from the main channels in the sandstone the lateral impregnation of the body of the rock, even to considerable distances, would take place.

Mr. Cazin objects to this theory (and considers the objection fatal) that the ore deposits are not local, but extend over Utah, New Mexico, etc., and hence they cannot be dependent upon local fissures; and, furthermore, that it is characteristic of the triassic sandstone that it is not fissured.

In reply I would say that, if the ore deposits are not local, neither are the igneous rocks local; and that according to Mr. Rolker the two go together—i. e., the larger or more pronounced concentrations are in the neighborhood of crystalline rocks. In the second place, I am compelled, on general principles, to doubt Mr. Cazin's statement concerning the absence of these fissures over such an extensive district. The greater portion of the juratriassic area between Leeds district, Utah, and the Nacimiento mountains, New Mexico, is deeply covered by later sedimentary rocks, exposed only in places in the deep canyons of the rivers which drain the country. Even these exposures have not all been investigated to prove either the presence or absence of silver or copper ores. One cannot speak, therefore, of an universal impregnation of the entire triassic sandstone, nor of the absence of fissures over that whole area.

Finally, concerning the existence of fissures in those places which have been explored, neither Prof. Newberry nor Mr. Cazin recognized any fissures; but Mr. Rolker has discovered the key to the whole problem when he recognizes the

## Existence of the Ore Channels

At the Stormont mine, and properly explains them, viz.: During the disturbances attendant upon the eruption of the neighboring igneous rocks, the sandstones were fractured without opening. Instead of producing open fissures to be subsequently filled like ordinary fissure veins, the result was the formation of cracks, along which, from the friable nature of the sandstones, the rock would be considerably crushed, and might, later, partially heal up. But the ultimate result would be the existence of numerous

## Vertical Channels or Water-Ways.

Which would certainly be followed by metal solutions forcing their way upwards. These water-ways would finally contain the largest amount of ore, and would form the ore channels which Mr. Rolker describes, and from them the lateral impregnation of the sandstones, even to considerable distances, would be easily effected.

These water-ways would branch and ramify through the rock in all directions, never making themselves visible on the surface as fissure veins, and, in fact, by the entire absence of all the usual characteristics of fissure veins, such as distinct walls, selvages, etc., would easily escape the observation of even such an acute observer as Prof. Newberry.

It is then by such a process as this that I would explain the wide-spread impregnation of the sandstone, so far as yet observed, and the apparent absence of fissures, as insisted upon by those who have written upon the subject.

The silver came into the sandstones, consequently, in the same general way that the silver came into the Comstock lode, or any other fissure vein, the present difference in the mode of occurrence being due to the fact that the fissures did not open, and that the sandstone absorbed the metallic solutions like a sponge, as fast as they came in contact with it.

## General Considerations.

The existence of water-ways was first suggested to me by a large and magnificent specimen of ore from the Bassick mine in Colorado, now in the museum of economic geology, of the University of Cal., presented about a year ago by Mr. J. B. Farish, then of Silver Cliff, Cal. The country rock of the Bassick mine is an igneous rock (sanidin trachyte) and the difference between their modes of occurrence at this mine and the Silver Reef mine is due entirely to the different nature of the country rocks. The trachyte exists in the form of irregular fragments from the size of a walnut to many ft. in diameter, all more or less rounded and greatly decomposed by the action of infiltrating metallic solution which have deposited the ore between the fragments. Had the rock been any where nearly as porous as sandstone, we should have found here the same extensive lateral impregnation as at Silver Reef.

A subsequent visit to the Sulphur Bank quicksilver deposit, in Lake Co., Cal., disclosed precisely similar relations at that mine. There again andesite which forms the Bank has been irregularly fissured at the time of its original solidification, and subsequently infiltrated with metallic solutions carrying mostly quicksilver ore.

I have learned recently from Prof. Joseph Le Conte, that this idea of the widespread occurrence of water-ways has been suggested by him in his lectures on geology for the past two years, and that in the next edition of his geology he proposes to give it prominent place.

We are both convinced of the value of the suggestion. In fact, it is only by means of it that many otherwise puzzling deposits can be understood. It brings likewise, into close genetic relation, a large number of ore deposits which pass in the literature as impregnations, stocks, veins of substitution, irregular deposits, geyser deposits, etc., into genetic relation, not only with each other but with what must be regarded as the simplest type of them all, viz: the fissure vein.

It is certainly to be expected *a priori*, that the process of rock fracturing that accompanies every considerable disturbance in the mutual relations of rocks, for one fracture that is accompanied by the formation of an open fissure, many would be formed without opening, and through which metallic solutions could force their way upwards. The form of the resulting deposit would then depend upon the nature of the rock in which the fracture was produced.

If the fissure opened, we should have the simple fissure vein; if it remains closed and the rock was porous like sandstone, should have, as at Silver Reef, ore channels with very extensive lateral impregnation of the surrounding rock, if the rock was not porous like the Bassick and Sulphur Bank rocks, we should have comparatively thin veinlets ramifying in all directions accompanied, as it always is, by extensive decomposition of the rock, if the rock is very readily acted upon, chemically by the metallic solutions, as is the case with limestone, dolomite, etc., the softer portions would be dissolved, outforming huge caverns of most irregular form, which would subsequently become partially or wholly filled with ore, as at the Eureka and Richmond Consolidated mines in Nevada.

The ore deposits at Silver Reef and at the Nacimiento mountains are by no means the first sedimentary rocks containing sulphureted ores, which have been discovered. These beds are the first that have yielded any considerable amount of silver; but copper, lead and quicksilver, and even gold, have long been known in similar beds. I will mention but one or two localities; thus, at Voropatak in the Siebenbrunnen mountains, the Carpathian sandstones are impregnated with gold and quartz; at Bleiberg, in Carinthia, galena is found in limestone; at Bohmisch-Brod and Schwarzkosteletz, in Bohemia, the sandstone of the Rothleigenden formation of the Germans is impregnated with copper ores. The copper schist of Mansfield, at the base of the Harz mountains, is another instance, and many more might be mentioned.

I have studied carefully the geological relations of many such deposits, to see which of the above mentioned theories best explained the recorded facts. The theory which best explains the phenomena at Silver Reef is, likewise, the one which appears most rational for most of the others. With but a single exception (Comstock near Aachen in Rhenish Prussia), sedimentary rocks are impregnated only in the neighborhood of eruptive rocks. I will mention here but a single striking instance, the copper mines of eastern Russia. Central Russia is one vast, monotonous region of comparatively undisturbed sedimentary strata, perfectly free from sulphureted ores of all kinds. But as soon as we reach the extreme eastern edge, where the igneous masses of the Ural mountains have forced their way upwards through the sedimentary beds, there we find these same sedimentary rocks impregnated with ores of copper; while, in the immediately adjacent mountains, the same metal is abundantly present in the fissure veins of the eruptive rocks.

## Prospecting in Sandstone Districts.

One more point and I will close. It is the answer to the question I asked in my introduction. "Has the prospector any practical guide in his search for the precious metals?" I can only state what must still be considered as about the only law which is generally applicable to all mineral districts where the precious metals have thus far been mined, viz: that deposits of the precious metals occur almost exclusively in the neighborhood of the massive crystalline rocks.

Gold and silver may at any time be found in sandstones and similar sedimentary rocks, but only in the neighborhood of the massive crystalline rocks, and it is useless to prospect sedimentary rocks for the precious metals at great distances from such geological formations.

It is scarcely necessary to add that superficial drift deposits and all kinds of placer deposits, both recent and older, may form exceptions to the law as above stated.

A. W. JACKSON.

Museum of Economic Geology, University of California.

THE track of the Ruby Hill railroad, Eureka, is covered with ore that has fallen from the cars while en route for the furnaces. Chas. Mette, a lad of 14, has been collecting it. He will make not less than \$10 per day.

THE May Lundy Co. began work last spring and are now turning out from \$7,000 to \$9,000 per week with a five-stamp mill.

EDISON is the most promising man in the country. He doesn't make light of his promises either.

## Physical Studies of Lake Tahoe.—No. 8.

(Written for the Press by Prof. JOHN LE CONTE.)

## Rhythmical Variations of Level in Lakes or "Seiches."

As might be expected, the waters of Lake Tahoe are subject to fluctuations of level depending upon the variable supplies furnished by its numerous affluents. In mid-winter, when these streams are bound in icy fetters, the level falls; while in the month of May and June, when the snows of the amphitheater of mountain-slopes are melting most rapidly, the level of the lake rises, and a maximum amount of water escapes through its outlet. According to the observations of Capt. John McKinney, made at his residence on the western shore of this lake, the average seasonal fluctuation of level is about 0.61 of a meter; but in extreme seasons, it sometimes amounts to 1.37 meters. The lake of Geneva, in like manner, is liable to fluctuations of level amounting to from 1.95 to 2.60 meters, from the melting of Alpine snows. But besides these variations of level, due to the variable quantities of water discharged into them by their affluents, many lakes of moderate dimensions are liable to rhythmical oscillations of level of short duration which are, obviously, not produced by fluctuations in the supply of water. It is to this kind or species of variation of level, that our attention will be directed in the sequel. This interesting phenomenon was first recognized in the Lake of Geneva; but was subsequently found to be common to all Swiss lakes, as well as to those of Scotland. It is, therefore, a general phenomenon, which may be observed in all lakes of moderate dimensions. The inhabitants of the shores of the Lake of Geneva have long designated this rhythmical oscillation of the level of the water, by the term "seiche;" and this designation has been adopted by scientific writers.

These "seiches" were first signalized in the Lake of Geneva, in 1730, by Fatio de Duillier, who ascribes them to the choking of the flow of the waters of the Rhone on the shoal near Geneva by the force of the wind at mid-day. Addison and Jallabert, in 1742, supposed them to be caused by sudden increments in the discharge of the effluents, due to the augmentation in the amount of snow melted after mid-day; or to the sudden increase in the flow of the Avre checking the outflow of the water by the Rhone. Bertrand supposed that electrified clouds might locally attract and elevate the waters of the lake and thus produce oscillations of level. H. B. de Saussure, in 1799, attributed the phenomenon to rapid local variations of atmospheric pressure, on different parts of the lake. J. P. E. Vaucher, in 1802 and 1804, adopted de Saussure's explanation, and confirmed it by many excellent observations. He, moreover, established that "seiches" more or less considerable, occur in all the Swiss lakes; and that they take place at all seasons of the year, and at all hours of the day; but in general more frequently in spring and autumn. As regards the cause of the phenomenon, Vaucher showed how rapid local alterations of atmospheric pressure would produce oscillations in the level of the lake, and compares them to the vibrations of a liquid in a recurved tube or siphon. Finally, Arago maintained that "seiches" may arise from various causes and traced the analogy between them and certain remarkable oscillations of the sea, including those arising from earthquakes. But physical science is indebted to Prof. Forel, of Lansanne, for the most complete and exhaustive investigation in relation to the phenomenon of "seiches." This accomplished physicist began his researches in 1869, and has continued them up to the present time. He has been able to demonstrate that these rhythmical oscillations occur in nearly all of the Swiss lakes (he studied the phenomenon in nine of them), and that they follow in all cases the same general laws. Those of the Lake of Geneva have received the most elaborate and prolonged investigation. In March, 1876, Forel established a self-registering tide-gauge (*limnimetre enregistreur*), on the western shore of this lake, at Morges; and with the co-operation of P. Plantamour, another one was installed, in June, 1877, at Secheron, near the city of Geneva, at the southern extremity. Since these dates, these two instruments, have, respectively, been registering the oscillations of the level of the water of the Lake of Geneva; and they are so sensitive, as to indicate the waves generated by a steamer navigating the lake at a distance of 10 or 15 kilometers. From a most searching investigation of all of the phenomena presented by the "seiches" in the Swiss lakes, Forel deduces the conclusion that they are really movements of steady unidirectional oscillation "balanced undulations," in which the whole mass of water in the lake rhythmically ewings from shore to shore. And, moreover, he shows, that the water oscillates according to the two principal dimensions of the lake; thus giving rise to longitudinal "seiches" and transverse "seiches." They occur in series of synchronous oscillations of decreasing amplitude; the first wave produced by the action of a given cause, having a maximum amplitude.

## Amplitude of Oscillations.

The amplitude of the oscillations constituting the "seiches" is extremely variable. This, doubtless, arises from the fact, that the causes

producing the disturbances of hydrostatic equilibrium are extremely unequal in intensity, and variable in kind. In some exceptional cases, the amplitude of the oscillations, has been very large; thus, there are on record the following extreme fluctuations of the level of the lake at Geneva:

Observed by Fatio de Duillier, in Sep., 1600, 1.624 meters; observed by de Saussure, Aug., 1763, 1.481 meters; observed by Venie, Oct., 1841, 2.138 meters.

By amplitude is meant the difference in height between the maximum and minimum level of the water in a complete rise and fall. Thus in Venie's observation the water rose 1.218 meters above the mean level of the day, and subsequently fell 0.920 meters below the same level, making the amplitude 2.138 meters. Hence, we may say that the extreme amplitude of the "seiches" at Geneva fluctuates between 0 and 2.14 meters. In ordinary "seiches," however, it varies from 0 to 30 centimeters, or from 0 to 11.81 English inches. At Morges, the self-registering instrument indicated amplitudes within the limits of 12.5 centimeters, and 0 and 4.92 inches.

## Duration of Oscillations.

Like the rhythmical oscillations of a liquid in a siphon, the duration or time of vibration of any series of "seiches" at any given place and originating from a given cause is independent of the amplitude of the oscillations. In other terms, the time of vibration is approximately the same whether the fluctuation of level be large or small. But the investigations of Forel clearly prove, that the duration of the "seiches" depends upon the dimensions of the lake, and upon the mean depth of the water along the axis of oscillation. Thus, in a long lake, the time of oscillation of a longitudinal "seiche" will be longer, than that of a transverse "seiche;" while, on the other hand, in a deep lake, the duration will be shorter than in a shallow one. Hence, it follows, that every lake has its own period of oscillation for both its longitudinal and transverse "seiches."

The disturbances of hydrostatic equilibrium, which generate "seiches," may be produced by a variety of causes. Among these the following may be cited:

- (a) Sudden local variations of atmospheric pressure on different parts of the lake.
- (b) A descending wind striking the surface of the lake over a limited area.
- (c) Thunder storms, hail storms and water-spouts; especially when the accompanying winds act vertically.
- (d) The fall of a large avalanche or of a landslide into the lake.
- (e) And lastly, earthquakes.

Observations show, that the most frequent and evident of these causes are variations of atmospheric pressure and local storms. With regard to earthquake-shocks as a cause of such fluctuations of level, it is a singular, and significant fact, that since Forel has established the delicate self-registering apparatus on the shores of Lake Geneva, no less than 12 earthquake-shocks have been experienced in this portion of Switzerland; and they have had no sensible influence on these sensitive instruments. In fact, a little consideration in relation to the character of such shocks renders in highly improbable, that such brief tremors of the earth's crust, could have any agency in the generation of rhythmical oscillations of the whole mass of water in the lake. Indeed, it is very questionable whether any earthquake waves are ever produced in the ocean, except when the sea-bottom undergoes a permanent vertical displacement.

## Puget Sound Country.

The Seattle *Intelligencer* says: In this immediate vicinity, King, Pierce, Snohomish and Kitsap counties, covering an area of 5,000 square miles, the principal pursuits of the people are farming, timbering, mining, manufacturing, shipping and trading. The population is about 15,000, of whom about one-sixth depend upon the tillage of the soil; as many more upon getting out saw-logs, cutting them into lumber, etc.; as many follow coal mining and its transportation, upon steamboats and other crafts; and the other half upon the ordinary avocation of town life. We have no one overtowering industry. At present, lumbering is a business paying handsomely all engaged in it. The demand is for all the mills get out, and the promise is that they will soon be unequal to the strain upon them. The same is true of coal mining. Prices of coal and lumber are higher at this time than they have been for several years. The life in these lines of business has its effect upon all others—upon the farmers, the tradesman, the professional man and the capitalist. The times may truthfully be declared good. The country included within the area described contains hundreds of thousands of acres of Government land as fertile as one could wish. It is generally accessible. The principal market is found in Seattle, where there is a considerable home consumption, and from which large shipments are made by steamships to San Francisco. Hops, potatoes, oats and barley are what are chiefly exported. The best time for a man to come to this country is now. Work is plenty, and at remunerative rates. There is no room here, though, for men without principle, ambition and cash. We have more than enough of that kind already, and they make a pretty sorry living of it.

THE last bid for lead in Salt Lake was \$45.

## THE ENGINEER.

### The Railroads of the World.

From a volume published by the French minister of public works, entitled the "Album of Graphic Statistics," the *Saturday Review* has compiled an interesting article in regard to the railroads of the world. Taking the kilometer for the standard, it may be roughly estimated at three-fifths of a mile, or exactly .621 of a mile. In 1830 the total lengths of railroads in Europe were 316 kilometers, of which 279 were in England, and 37 in France. In the United States, there were 65 kilometers. In 1850, Europe had 23,083 kilometers, of which 10,656 were in the United Kingdom. Germany had 5,323, and France only 3,080. In the same year, the United States had 14,443 kilometers. In 1870, there were 104,120 kilometers, of which the United Kingdom had 24,999, very nearly one-fourth of the whole. But Germany, during the 20 years, had more than trebled her railroads, and possessed 18,560 kilometers. France had not been asleep, however, and had 17,924 kilometers.

In 1876, the United States had 84,637 kilometers, or about four-fifths of the mileage of Europe. In 1878, the increase in Europe was 50% over the railway system of 1870. Germany had then, it seems, the greatest lengths of lines in Europe—some 31,556 kilometers, while France had only 24,424 kilometers. The Germans, then, had much greater facilities in sending troops forward than had the French. This want of railroads in France may account for Mr. de Freycinet's railroad policy. Two years ago, according to the French authority, we had 131,682 kilometers of road. In comparing the length of railroads with population, Sweden is the best provided of any of the European states, having 1.03 kilometers for every 10,000 inhabitants.

Taking the mean in Europe, it is 5.3 kilometers for every 10,000 inhabitants. The United States is prodigal with her railroads, having 39.9 kilometers to every 10,000 people, six times more than the European mean, for the reason that we build roads to attract population, thus "reversing ordinary European ideas that railways should attend traffic, not go before it." For comparison of kilometers to area of kilometers of surface, Belgium has 13.5 kilometers of road, Germany 5.8, France 4.6, the mean of Europe being 1.7, and, strange to say, the United States mean is about the same as the European one.

From the statistics, the English reviewer seems to think that outside of England, Holland and some few minor European countries, railroad construction has hardly commenced, and that if the world is only at peace for a short period, railroad building will shortly take a fresh start of activity, and once more give rise to a brisk demand for iron and steel.

### The Isthmus Ship Railway.

Capt. Eads is a good persuader. His remarkable scheme of a ship railway across the Isthmus of Tehuantepec is taking a tangible shape. The Mexican Government has made a very liberal concession, giving him the right to construct a railway on such line as he may select, the work to be commenced within two years and completed within 12 years. He is allowed to charge \$5 per cubic meter of the displacement of each vessel transported; also \$15 for each passenger on the ship, and 1% on the value of coins or precious stones carried. The Government also gives him a subsidy equal to 1,000,000 acres of public lands, and makes other liberal concessions. While this will go but a little way toward the estimated cost of \$75,000,000, it will doubtless assist Capt. Eads in raising money in the United States. He desires to have our Government guarantee 6% dividends on \$50,000,000 of the stock of the company in consideration of free transportation of Government ships, officers and soldiers, and the benefit which the proposed road will be to our commerce. This, however, will be difficult to obtain. The projected road is, if built, to be about 112 miles in length, while the proposed Panama canal will be 45 miles long; but the Tehuantepec route will save about 1,500 miles between New York and San Francisco over the Panama route, while the distance from the mouths of the Mississippi to California by Tehuantepec is 2,300 miles less than by Panama. The Panama canal and the ship railway are fairly in the lists as competitors, while the Nicaragua canal scheme is also being urged, and if all are completed, it will be all the better for the country.

**TUNNEL THROUGH THE PALISADES.**—Chief Engineer Katta is getting his machinery on the ground, preparatory to building a double track tunnel through the solid mass of rock known as Bergen hill, for the New York, Ontario and Western railroad. Its length will be 4,225 ft., and it will extend from Weehawken, on the Hudson river, westward to the Hackensack meadows at New Durham. The time within which this work is to be accomplished would have astonished people born before the era of modern engineering, as the contract says all must be complete one year from date, November 19, 1880. The eastern approach cut measures 150 ft.; the tunnel proper, 4,225 ft.; western approach cut, 2,700 ft. The earth cut comprises 131,000 yards; loose rock, 9,000 yards;

solid rock, 44,500 yards, exclusive of 79,607 yards on the tunnel proper. Length of tunnel, 20 1/2 ft.; width, 27 ft. The shafts, five in number, involve 2,103 ft. of rock cutting; area, 7 x 15. The track will rise 25 inches per 100 ft. to a point near the meadows, and then fall 40 inches per 100 ft. The new railroad will give a third route through the rocky barrier of the lower Hudson, of which the Delaware, Lackawanna and Western and the Erie are the first two.

**MINING UNDER THE SEA.**—A number of English coal mines are being worked under the ocean. In Northumberland, Eng., the net available quantity of coal under the sea is estimated at 403,000,000 tons, and on the Durham coast under the sea, including a breadth of 3 1/2 miles with an area of 71 square miles, 734,500,000 tons. The latter mine is in a vein of an aggregate thickness of 30 feet, distributed in 6 seams. Engineers are considering how it can be worked successfully in the future.

## USEFUL INFORMATION.

### Luminous Paint.

According to the London *Building News*, luminous paint is getting into quite extensive use in England. Mention is made of offices coated with the paint, which give great satisfaction to the occupants. The effect is that of a subdued light, every object in the room being clearly visible, so that in a room so treated one could enter without a light, and find any desired article. The luminous paint is excited by the ordinary daylight, and its effect is said to continue for about 13 hours, so that it is well adapted for painting bedroom ceilings, passages that are dark at night, and other places where lamps are objectionable, or considered necessary. For staircases and passages, a mere band of the paint will serve as a guide, and costs but a trifle. For outdoor purposes the oil paint is used, but for ceilings and walls, the luminous paint, mixed with water and special size, can be used the same as ordinary whitewash, and presents a similar appearance in the daylight. By the recent discovery that it can be applied as ordinary whitewash considerably expands the field of its usefulness. Sheets of glass coated with the paint are in use in some of the vessels of the navy, at the Waltham powder factory, at Young's paraffine works, and in the spirit vaults of several London docks; and now that, by increased production and the use of water as the medium, its cost is reduced by one-half, it will probably be extensively used for painting walls and ceilings. The ordinary form of oil paint has already been applied in many ways to statues and busts, to toys, to clock faces, to name plates and numbers on house doors, and to notice boards, such as "mind the step," "to let," etc. The paint emits light without combustion, and, therefore, does not vitiate the atmosphere. Several experimental carriages are now running on different railways, the paint being used instead of lamps, which are necessary all day on account of the line passing through occasional tunnels.

**SPONTANEOUS COMBUSTION OF WOOD.**—The *American Journal of Science* gives a remarkable instance of the spontaneous combustion of wood. A Mr. Adam Reigart, two years previous to the occurrence, received a piece of wood, supposed to be cedar, detached from a large piece dug up 39 ft. below the surface, near Lancaster, Penn. The piece weighed a few ounces, and it was broken in two and laid upon a white pine shelf in Mr. Reigart's counting room. About four days before the discovery of the fire he had occasion to wipe the dust from the shelf and from the piece of cedar, with a wet cloth. Three days after it was discovered that the piece of wood had ignited and combustion was proceeding so rapidly that in a few minutes the shelf would have been on fire. Probably another prolific source of our forest fires is to be sought in the liability of decayed wood, not only to spontaneous combustion, but from the direct rays of the sun. At Winchester, Conn., some years since some workmen, about 2 P. M., on August 5, discovered smoke arising from a barren upland. The sun was excessively hot at the time. When they went to seek the origin of the smoke they found that the remains of an old decayed hemlock log had burst into a blaze, and were burning fiercely.

**TO CURE A SHEEP SKIN.**—To clean the wool on a sheep's skin and to cure the skin.—Nail on a board stretched, wool out, and scour with good soap suds and fuller's earth until properly cleansed. Then rinse thoroughly in hot water, and comb. Nail, wool down, stretched taut on a board, rub in plenty of salt, stand in warm place, and finally scrape off the softened inner membrane with a blunt knife. Then rub in plenty of moist alum powder, and let it stand several days or a week in a dry place. Soften, if desired, by rubbing with hot flour paste and the yolks of a few eggs, or with plenty of oil.

**A POWERFUL QUINQUET.**—Says Senator Beck: "Scott, Garrett, Huntington, Gould and Vanderbilt, the five railroad magnates, can sit down, and in a five minutes' chat fix a tax of \$200,000,000 upon the commerce of this country by raising freight two cents a bushel, and do it according to law."

### The New Tanning Process.

The Edlington Chemical Company, of Scotland, have been for some time actively engaged in perfecting the new tanning process by bi-chromate of potash. The leather which they have produced appears to be a very serviceable article. The *Scottish Leather Trader*, says:—We have seen a fine sample of strap butts, from native hides, where the fiber had thoroughly absorbed the tanning, and to anything but an experienced eye had all the appearance of an ordinary tannage. The color was good and the butt mellow; also a sample of crupper, of which the tanning and currying are thorough, and there seems nothing to prevent it suiting all the purposes for which this kind of leather is used; also a sample of calf which seems to us perfect and scarcely to be distinguished from the best home dressed. Samples of the tannage have been submitted for analysis to Dr. Clark, the city Analyst of Glasgow. These samples were bends of foreign and native pelts, butts, buffalo hides, and calf skin. The object of the analysis was to ascertain the total quantity of chromium which they contained, and the amount which was extracted by the action of water under different circumstances.

The result of the analysis and examination is reported as highly satisfactory. The leather was also submitted to Mr. Kirkaldy of the testing and experimenting works, Southwark, London, for the purpose of ascertaining the tensile strength of chromotanned vs. bark tanned leather. The results of the experiments showed that the chrome leather exceeds bark in strength, and that after it has set under the necessary stress it still retains an extraordinary amount of elasticity, which is available for tightening machinery belting or pulleys. For instance a piece of chrome leather, bore an ultimate stress of 3,297 lbs. per square inch, while a piece of bark leather only bore an ultimate stress of 2,672 lbs. per square inch, which proves the samples of chrome tanned to be stronger than bark tanned by 15 per cent.

**PALMETTO PARCHMENT.**—People of the Southern States discovered that smooth, strong and pliable parchment can be manufactured from the palmetto of Florida and other Southern States. The parchment can be washed, rubbed and handled just like cloth, and the writing will not be effaced. It can be cheaply manufactured, and is likely to come into general use for conveyances, land office receipts, etc. As much as 60% of the weight of the palmetto can be utilized in paper making.

## GOOD HEALTH.

### Fool Boys.

The Callow Youngsters who Puff Cigarettes.

Physicians and moralists alike are pained by the spectacle, growing more common every day, of pale-faced lads, ranging in age from 16 to 20 years, who are puffing their little lives away in cigarette smoking. Day and night they throng the streets, where the peculiarly offensive odor generated by cigarettes made of cheap paper and had tobacco renders their smoking as obnoxious to others as it is hurtful to themselves. Every evening before the doors of the theaters, they raise a cloud of foul smoke that is equally injurious to their own rickety constitutions and to the noses of their victims. Doubtless, also, they carry their pernicious habit into their homes—when they are old enough to do so without risk of the spanking they deserve—thus still further doing harm to themselves and making other people uncomfortable.

The cheap cigarette is a modern invention, and a peculiarly vicious one. Twenty years ago, when the cigarettes all came from Cuba and were wrapped in rice paper, smoking them did no great harm. Moreover, being made of Honduras, or some brand of equally strong tobacco, only a boy of stout stomach could smoke more than two or three of them at a time. But to meet the hoyish demand cigarettes are sold nowadays both cheap and weak. They are made of mild, often had tobacco, and for the most part they are wrapped in ordinary white paper. Rice paper wrappings necessarily increase the cost, and the boy who wishes to prove by the ordeal of smoke that he is not a boy but a man, much prefers the article that he can get the most of for his money. Moreover, the hoy does not know the difference apparent to the sight between rice paper and ordinary paper, any more than he knows that while rice paper burns away with scarcely any smoke at all, common paper burns with a foul smoke that cuts like a saw into the chest and throat. So he spends his money on cheap cigarettes and makes everybody around him uncomfortable while he humbles himself away into an untimely grave.

Of course, the boys do not intend to sin against themselves and their neighbors. They do not realize what a bad smell their nasty little cigarettes make, and they are very far from knowing what serious injury the smoke from them inflicts upon their throats and bronchial tubes and lungs. They smoke in innocence, not knowing what they do, but most earnestly believing that their smoking makes men of them. Down in the depths of their hearts the most of them have no sincere affection for smoking; and in the depths of their stomachs, they not unfrequently entertain a feeling of positive aversion toward it. But they hang on to their pestilent habit with a persistency that, in a bet-

ter cans, would be worthy of all praise, stiling the dictates of conscience and asserting a bad mastery over the rebellions of the flesh. And, if reasoned with, they answer in the words of dear John Leech's had boy, "But what is a fellow to do, when all the misu of his own age smoke?"

### Effect of Strong Drink on the Liver.

The *Family Physician* tells us that when alcohol is introduced into the stomach in the ordinary way, it nearly all passes through the liver. Undiluted spirits are much more injurious than when mixed with water, and produce greater irritation. Alcohol consumed as wine or beer is far less destructive to the liver than when taken in the form of ardent spirits. A hot climate intensifies all the vicious effects of alcohol. The symptoms of cirrhosis of the liver are in the early stages often obscure, but later they are sufficiently well marked. At first the liver gets slightly enlarged, and the patient suffers from pain in the right side, indigestion, wind and costive bowels. He is occasionally feverish, his skin is hot and dry, and he has a peculiar, unhealthy, sallow look, which he probably fails to notice, but which is sufficiently obvious to his friends. The necessity for making a change in his habits is forced upon his attention, and for a week or two he is under the doctor's orders, and not feeling able to drink any more, he consents to follow a restricted diet, and to take a course of purgatives.

Soon the most prominent symptoms are relieved, he fancies himself well again, and quickly returns to his old habits. Gradually, however, he notices that he is getting thinner and weaker, and occasionally he has a good deal of pain in the side. He is nervous and out of sorts. He has no longer the pluck he used to have; first his friends notice it, and then he gradually becomes aware of it himself. He finds that he is not "fit for business," and he is afraid to see people. The patient has occasional attacks of diarrhea, his appetite fails, and the emaciation and debility increase. He tries all kinds of treatment, but never sticks to one for long at a time. He would give up the drink if he could, but he can't. His self-reliance is gone, the alcohol has stolen away his will, and he is utterly incapable of giving up the dangerous fascination. He will take an oath to-day that he will never touch another drop of spirit, and will probably break it to-morrow. Sometimes he wishes that some would lock him up in an asylum, or that by some chance or other he would have six months' imprisonment, but he never feels able to put himself under restraint. After a time the liver gets smaller, and this, instead of being a good sign, is a bad one, for it is contracting. He would willingly enough consent to knock off drink now, but it is too late; the mischief is done, the liver is in a state of cirrhosis, and no medicine can restore it to its natural condition. Is there any remedy for this horrible complaint? Yes, one, teetotalism—absolute abstinence from alcoholic liquors of all kinds. This remedy must be applied early. If he waits until his liver has undergone serious organic change, it is too late. No half measures will suffice; he must give up drink of all kinds. If he does this he will recover; but if he goes on in his old plan an early and painful death is the inevitable consequence.

**SUGGESTIONS CONCERNING LONG LIFE.**—If any one could furnish the world with a medicine which would insure a long life, there is no end to the demand he would have for his drug. The *Herald of Health* thinks he would need many factories to make it, and many banks to hold the money he would receive. Fortunately, there is no such medicine, and so the world will have to get along in some other way. Some time ago the French government sent a circular letter to all the districts of that country to collect information as to those conditions of life which seemed to favor longevity. The replies were very interesting, but on the whole rather monotonous; and the general result was that longevity is promoted by great sobriety, regular labor, especially in the open air, short of excessive fatigue, easy hours, a well-off condition, a philosophical mind in meeting troubles, not too much intellect, and a domestic life. The value of marriage was universally admitted, and long-lived parents were also found an important factor. A healthy climate and good water were mentioned. All this agrees with common sense, unless the idea that the intellect is a hindrance to longevity be considered unreasonable, and we know that some of the most intellectual men have lived to great age.

**SODA FOR BURNS.**—All kinds of burns, including scalds and sunburns, are almost immediately relieved by the application of a solution of soda to the burnt surface. It must be remembered that dry soda will not do unless it is surrounded with a cloth moist enough to dissolve it. This method of sprinkling it on and covering it with a wet cloth is often the very best. But it is sufficient to wash the wound repeatedly with a strong solution. It would be well to keep a bottle of it always on hand, made so strong that more or less settles on the bottom. This is what is called a saturated solution, and really such a solution as this is formed when the dry soda is sprinkled on and covered with a moistened cloth. It is thought by some that the pain of a burn is caused by the hardening of the albumen of the flesh which presses on the nerves, and that the soda dissolved the albumen and relieves the pressure. Others think that the burn generates an acrid acid, which the soda neutralizes.

## Business Announcements.

Dividend Notice—Eureka Con. M. Co.  
Annual Meeting—Peytona G. & S. M. Co.

## The Week.

The rain has continued off and on during the week, but the rivers have fallen and the floods are over. It looks now as if there would be a scarcity of water for the hydraulic mines in the spring. Although we have had heavy storms there is little snow comparatively in the mountains, the warm rains having melted it; and the water supply in the spring will therefore be necessarily short.

The Legislature has as yet come to no conclusion in the debris question, and there seems to be a dead-lock, which retards legislative business of all kinds. No important measures have been passed this week. A summary of the work done will be found in another column.

News from the mines generally seem pretty good. In several places quartz mines have more surface water to contend with than usual, and have shut down. The wet ground and abundance of water have been good for hydraulic miners, however.

There seems to be trouble brewing with regard to miners' wages. In Silver Reef, Utah, the mines are closed owing to the refusal of miners to have their wages reduced from \$4 to \$3.50 per day. In Lewis district, Nevada, wages have been reduced to \$3.50 and there is trouble there. It seems to be Eastern companies which are urging this reduction, and miners' unions are opposing it.

Ice has again become an annoyance and nuisance in New York harbor and East river. While the fields are not as large as a fortnight ago, they are much thicker, and no ordinary boats attempt now to break a way through them.

THE bullion tax on the Comstock for the December quarter is a little over \$3,600; Con. Virginia being \$1,213; California, \$967; Union, \$502. Belcher and Crown Point are on for small amounts.

OWING to the impure air in the header of the Eureka, Nev., tunnel they can work but one shift in 24 hours at the present time.

## Oakland Harbor.

Work for the improvement of the harbor at Oakland, in San Francisco bay, is being carried on. Some idea of the extent of this great engineering enterprise may be better realized when we state that the two jetties, which are nearly parallel, extend from the shore line out into San Francisco bay a distance of 12,076 ft. This is 1,000 ft. longer than the jetties built by Capt. Eads, at the mouth of the Mississippi river, about which the public has heard so much.

The stone contract now under way at Oakland, contemplates raising both existing walls up to high-water level, by building a heavy dry-stone coping on its old walls as a foundation. The stones on this coping are being carefully placed in position, the stones weighing frequently from one to two tons each, the spaces between these large stones being carefully filled in with smaller sizes by hand, so as to make a good compact wall.

Where most exposed to the sea the crest is made eight ft. wide and with a slope of two to one, composed of stone carefully laid down to a point two ft. below low water.

The total amount of stone required to finish this present contract is estimated to be between 60,000 and 75,000 tons, the price per ton delivered and placed in proper position being \$1 and \$1.19, depending upon size.

The stone now being added to the walls is taken from McNear's quarry at Pedro Point, opposite the Sisters' lighthouse, at the entrance of San Pablo bay, whence it is brought in large light-draft barges, towed by a tug, and delivered at the site of the jetties at the rate of 8,000 tons per month. These barges are drawn up parallel with the walls at high water, and the rock is thrown on to the wall or wheeled down in position, according to this work being done. The men who are doing the contractors' work live in a floating barge, which is moored near by the scene of their labors. Work has gone on pretty rapidly this winter, as we have had smooth water so much of the time, few gales having occurred.

The object of raising the walls up to high water is to confine the ebbing tide from this inner harbor, more effectually than has been heretofore done by the low walls built during previous contracts, and which have permitted the best half of the tidal waters to escape laterally over their tops. This has, of course, lessened the scouring action of the ebbing waters, as they were not properly confined in the channel between the walls. On the very high tides a vast mass of water sweeps laterally across the jetties, and it is not until the tide has half fallen that the water can do what scouring is necessary to keep the channel clear. This lateral sweep of the water is dangerous for sailing craft during light winds, since instead of the tide taking them to the mouth of the harbor, it is apt to sweep them on to the north wall with the ebb and south wall with the flood tide.

The walls, as they have been for a few years past, might have been considered obstructions rather than aids to navigation. Being out of eight except at half tide, schooner men had to be very careful not to run on to them.

In addition to the stone work now going on, it is contemplated shortly to dredge out and widen the present deep-water channel between the jetties, so as to offer better facilities for navigation. The channel dredged out is now so narrow that steamers passing are crowded, and sailing vessels are apt to get ashore. It is confidently expected that the effort of raising the jetties to high-water level will be to maintain such a channel free from sandy deposit, no matter whether it comes from the inner harbor or from the wave action of San Francisco bay.

The work on this harbor has been going on under the direction of Lieut. Col. G. H. Mendell, U. S. Engineer, ever since its commencement in 1874, and the results have been very successful in developing the commercial value of this well-known sheltered and safe harbor, being one of the few such on the Pacific coast. Mr. L. J. Le Conte is the engineer, under Col. Mendell, in immediate charge of the work.

In 1874 boats drawing over five or six ft. of water could hardly bump along over the bar at high water and carry cargoes of not more than 60 to 100 tons.

Since 1878 ships and barks from 1,800 to 2,100 tons burthen have been running regular trips and drawing from 16 to 16.5 ft. of water. The completion of this year's work will admit of easy navigation for vessels drawing from 21 to 22 ft. of water, which is ample for most foreign vessels that come over the bar off the Golden Gate.

The Congressional Representative, Hon. H. F. Page, deserves credit for his perseverance and energy in disposing of the title question to the Oakland mud flats. This point was finally settled by the Attorney-General to the effect that the United States has supreme control up to the line of the salt marsh. The sum of \$50,000 was appropriated this year for this harbor, accompanied with the following proviso: "The same heretofore appropriated for this purpose, and unexpended, are hereby reappropriated; but the sums so appropriated and reappropriated shall not be available until the right of the United States to the bed of the estuary and training walls of this work is secured free of expense to the Government, in a manner satisfactory to the Secretary of War." This proviso

Mr. Page has endeavored to have struck out, on the ground that the question of title to the bed of the estuary had already been settled to the satisfaction of the Secretary of War by the elaborate opinion rendered by Attorney-General Davis last summer, which was conclusive as to the right of the United States to make the improvement—this being the only way the question could be settled, unless the Government should choose to authorize some one to bring suit against it. The enactment of the proviso, he said, would simply lead to a repetition of what was done last year, and with the same result. His motion was defeated by only three votes, and he therefore offered an amendment making this proviso applicable to all other improvements provided for in the bill, on the ground that Oakland harbor should not be treated as an exceptional case. This amendment was rejected by seven majority, and the subject was then dropped. Page's main object in offering this first amendment was to obtain an opportunity of placing the facts upon the record, and he accordingly got permission to print this Attorney-General's opinion as a part of his remarks for future reference. He is confident, as above intimated, that the enactment of this proviso will not delay the use of the appropriation.

## Reducing Ores.

Levi Stevens, of Washington, D. C., who, it will be recollected, was in San Francisco some years ago with a patent furnace for smelting ores by petrolum, has devised another process of reducing ores. There was considerable excitement at the time of his visit here, on the subject of low grade ores, and he sold rights to use his furnace, for an aggregate sum of \$40,000 or \$50,000, though it never came to anything.

His new furnace is triple in its character, by which it performs the threefold office of smelting, matting and roasting in one continuous operation. The products of combustion, after performing their function of smelting the ores, operate further summarily to mat and roast them.

In connection with this furnace he has a process of reducing ores by forcing superheated steam together with air through incandescent coal in a gas generator, thereby producing rapidly a large quantity of gas of high heating quality. This inflamed gas is conveyed in its highly heated condition immediately on to the ore.

A hot air chamber is placed in the top of the gas generator, and in connection with an air jacket, covering, or partly covering, the top of the furnace. Through the air jacket is forced atmospheric air, which serves to absorb the heat that would otherwise be radiated from the top of the furnace, and conveys it to the hot air chamber, from which it is discharged in the form of a hot blast, to perfect the combustion of the gases as they pass the bridge wall. The body of the furnace is made in the form of an inclined shaft, comprising, in sequence, a smelting, a matting and a roasting chamber. The bed of each of a series of shelves above the matting furnace is formed with openings, through which air is admitted, and through which, also, the ores can be moved from any shelf to the one below, and so on down, exposing the said ore to the action of the heat from within the furnace, and also to air drawn in through the openings, as they are moved from the upper to the lower shelves; and keeping each charge of ore separate from the more thoroughly roasted ore below, and the less thoroughly roasted ore above, until moved into the matting furnaces from the lowest shelf.

After the fire has been built in the gas generator or fire box, and the fuel is incandescent, ore is put in through a hopper. Superheated steam is injected into the ash-pit. This produces a powerful blast through certain parts, and the dry steam and air are forced up through the incandescent fuel. The steam is decomposed into its elements, thus aiding combustion. The hot products of combustion, at a turning point provided by the construction of the furnace, are met by a current of hot air. These joint currents, producing almost absolute combustion of the fuel, and multiplying the quantity of inflammable material by reason of the additional hydrogen, or carburated hydrogen, derived from the injected steam, thereby, the inventor says, giving to the incandescent gases, which are finally deflected upon the matted ore on the bed of the melting chamber, an intensity of heat, which only the most refractory substances can resist.

The products of combustion, having thus operated to melt the ore, continue on through a chamber where they mat the ore still on its way to the melting chamber, and next through another chamber, where they encounter air entering through other openings, which serve to ignite them afresh, thus aiding the operation of roasting. This accomplished, the gases pass into the chimney and escape, the inventor having done about as much with them as could be expected.

THE hydraulic claim formerly known as the Knickerbocker, just above Sargent & Jacobs' claim, at Quaker Hill, Nevada county, has made a clean-up of \$2,002, after a run of 20 days with one monitor. The expense was \$350, leaving a gain of \$1,650.

## Southern Inyo County Mines.

Resting Springs was formerly a halting-place on the old emigrant road a short distance from the Amargosa river, in Inyo county. About 1870, there were a great many stories in circulation about a famous mine supposed to have been found in the country somewhere in this vicinity. It was related that such rich ore had been found by an emigrant that he had made a gun-sight from a piece of native metal. Prospectors hunted all over the country, looking for the "Gun-Sight" mine—and some of them are hunting for it yet.

Some time in 1873, a mine was discovered which was supposed to be the Gun-Sight, and was so named. This mine was purchased by J. B. Osborn, and he and other Los Angeles capitalists have been working it ever since. They erected a smelter at Tecopa, and in 1876 had 1,200 tons of ore. For some reason the furnace operations were not successful. It was continually "freezing up." Finally they concluded to put up a larger smelter, which, however, met with no better success. A pulverizer was then put up at Resting Springs, but this did not work. Finally a 10-stamp mill was put up. About a year ago they began to run the Ward tunnel to tap the vein 500 ft. lower than the old lowest level; this will be at a depth of 800 ft. The tunnel is in 1,000 ft., and connection with the winzes has recently been made.

The mines in this vicinity have not been worked very vigorously, as they have all been waiting for the Gun-Sight to go ahead. The delay in vigorous work has run out about three sets of miners; that is, they have taken up the claims, worked them a while, and waited for the leading mine to prove its worth, so that attention would be attracted to the district. But the mill, since it was built, has never run more than two months at a time. The ore has been hoisted, but now they can get it out through the tunnel it is probable they will get out more.

It would seem as if the easiest way to get to Resting Springs was from Mojave Station on the S. P. R. R., and that will eventually be the way. Now, however, the principal travel is by way of San Bernardino, because the country along the road is settled. The mail comes to the district from San Bernardino but once a week.

In conversation with a gentleman recently from the district, we learn that the country thereabouts is full of mineral; besides the silver and gold, there are veins of galena, copper, iron, etc. The place is so isolated, however, and there has been so little to attract population that there has never been any excitement about it. A few wandering miners on their way to or from Arizona, look over the country a little, but it has never been thoroughly prospected.

The Gun-Sight mine, to which we have referred as the principal one in the region, belongs to the Los Angeles Mining and Smelting Company. They have worked the mine steadily, and paid for everything they had. No stock has ever been sold, nor have they tried to sell any. All supplies, labor, etc., have been promptly paid for, and there has never been any trouble in getting money from the company. The Gun-Sight above was galena; but when they worked further, carbonate ore was found, running from \$60 to \$4,000. It averages at the mill about \$80 per ton. About 40 men are employed at the mine, and there are about 300 altogether in the district.

The miners who own claims do their assessments every year, but not much more, apparently holding on for the big mine to make a stir. There is no custom mill to work the ores for the miners. On Gun-Sight mountain a few years ago was found a streak of black ore 100 ft. long on top and about four feet wide, lying on the surface. About \$30,000 was taken from this mass when it pinched out.

It is 20 miles from Resting Springs to the old Amargosa gold mines. The miners, years ago, took out some ore there, but the Indians came along and killed all the miners at the camp. The mines have lately been taken up again, and some work is being done.

A single mine has lately been found in a range about 75 miles south of Ivanpah, at the place where the last Indian war was carried on. The mine is on Providence mountain. It is being worked, but there is no mill as yet. They are taking out some rich silver ore. This mine is in San Bernardino county.

If the Gun-Sight mine at Resting Springs goes ahead steadily the camp will come out all right. Affairs have moved so slowly, however, that the patience of many has been worn out. The ore is soft and easy to work, going through the mill very fast. It contains some horn silver. In running the tunnel they have, of course, done a good deal of dead work, but the business of the company is managed on the same basis as a commercial one—in an economical and proper manner.

EXTENSIVE SHIP BUILDING.—Ship building on the Clyde was unusually active last year. Two hundred and forty-one vessels of all kinds were launched, of a total, officially, 239,000 tons, an excess of 71,000 tons over 1879. Their marketable value represents an outlay of about \$30,000,000.

A young man named Walford was killed on Monday at the Lyon Gravel mine, near Placerville. The car became unhooked and ran over him.

## The Alaska Mines.

## Description of the Newly Discovered Districts.

While the southern Territories of the United States are just now attracting a large share of attention from the mining community, the northern Territory of Alaska is also putting forth its claims as a mining region; and it is probable that the coming summer will see many prospecting parties in the field. Last year there was considerable prospecting done, but the winter of course, stopped work generally. It has been somewhat difficult to get any reliable news from the various camps which are being opened, and reports have been somewhat conflicting. We have received, however, from Mr. George E. Bilz, who is now at Sitka, a letter in which he communicates considerable information of interest concerning the mines; and as he has evidently personal knowledge of the matter, his statements are more direct than any we have received. Mr. Bilz's letter is as follows:

EDITORS PRESS:—I think it probable that as you have not heard for a long time from this part of the coast (Sitka), a few notes in regard to certain newspaper reports may be of advantage to the readers of the MINING AND SCIENTIFIC PRESS. During the past summer, feeling confident of the mineral wealth of Alaska, I fitted out seven different parties to prospect, each with six months' provisions and equipments. I also paid each party, which consisted of five or six men, regular wages; as otherwise I could not expect to have the prospecting of the country done to my own satisfaction.

The last of the seven parties returned in the latter part of November, and brought back to Sitka, on a canoe, about two tons of the richest quartz I ever saw in any country. I went up to this new El Dorado, leaving here on the 25th of November, and arrived there, on a canoe, on the 29th of the same month.

The district is called after the discoverer, "Harris district," and is situated on the main land of Alaska, between the Takou and Chilcat river, in 58° 28' north latitude and longitude 134° 10', within four miles of Stephenson's straits, opposite Douglas Island, on the northern end of Admiralty island.

The discoveries of the ledges and placers were first made on Gold creek, but since traced and found in Salmon creek and Glacier creek, five and seven miles northwest respectively, and in Sheep creek, three miles southeast. The same ledges and ores were found 30 miles southeast, and in Windham, Spruce and Sehug creeks, where, for the last five years, the placers have been paying well to a small lot of men. In Gold creek and its tributaries some 60 claims are now already taken up and staked out, and on all very encouraging prospects have been found. They may be called \$5 to \$20 diggings. But very little can be done there before April or May, as the men are not prepared to work yet, and are only getting ready and prospecting their grounds.

## The Ledges.

The ledge which made these placers are at the head of the creek, and cross the creek twice in a distance of about two miles. There is but one belt of them, which is about 3,000 ft. wide, and in it the six main ledges run parallel to each other, besides a number of smaller veins, but which are taken in by the main locations, as those are only about 300 to 500 ft. apart, and are from 6 to 30 ft. in width. These ledges, which show bold cropping for over three inches (so far as I have been on them), hold very regular in size and distance apart, and the whole length show the richest kind of ore. The quartz is imbedded in soft slate, and is quite decomposed and brittle. The gold is mostly free in the quartz, but the richest ore is in the galena, which is the only disadvantage of the ore, as I expect it will interfere with the amalgamation; yet the gold is quite coarse and very heavy, so that it will readily concentrate with the galena to be smelted there. I have made upward of a hundred assays, both fire and wet, and the lowest assay out of the very poorest piece of quartz yielded \$33 per ton, while the average of my assays which might be also called average of the ledges, are 285 per ton, and run from \$100 to \$5,000 per ton; and then I have never yet assayed any specimens.

The ledges were respectively called the Jamestown, Takon, Pilz, North Star, Montana, California ledges, and on each there are claimed already six locations of 1,500 ft. each, with plenty of ore on all of them. In the creeks lay thousands of tons of the richest kind of ore, every piece of which shows the gold plainly, and a good many of the placer claims are valuable for the quartz which lies on them.

## Water in the Creeks.

There is an abundance of water in the creeks as they are fed from eternal snow banks high up in the mountains, and there were on the 15th of December, all of 3,000 inches running, which is the lowest water of the year. There is nothing to prevent working these mines the year around. As far as this (January 18th), in the season, we have had only six days of frost, and now there is no snow as far as 1,000 ft. above sea, and it rains a good deal, of course, in the high mountains. It snows in the higher mountains.

The country is thickly timbered with red and black spruce, black pine, hemlock, alder and red birch, not so tremendously thick as on the

island, as there is 100% more moisture on the archipelago than on main-land.

The way to it is very easy and any large vessel can sail to the mouth of the creeks and anchor within 200 ft. of the shore. Already I had a 150 ton steamer up there, taking up my men and supplies, and by the middle of February, I expect to have the mail steamer *California*, running up there with lumber and supplies. Outside of this district one of my parties found

## A Silver Ore District

Between Lynn canal and Youiatate and Hoonah island. The ore they brought from there is most encouraging. They brought some chloride and some bromide silver ore which is quite high grade, and they claim to have plenty of it. They also bring samples of argentiferous galena, from a whole mountain of the kind, which yields 40% lead, and \$25 to \$60 per ton in silver.

Another ledge they report quite large, the samples yielding from \$30 to \$120 in silver and \$60 to \$100 in gold. They report also and bring fine samples of copper-silver glance, antimonial silver, and sulphurets of copper, in large quantities. This is called Morrisana district, and I shall visit it early in the spring in the U. S. N. steam launch. I must not forget to give due credit to Commander Glass and the other officers of the U. S. ship *Jamestown*, for their ready assistance to us prospectors, they having done everything in their power to further our efforts. You will please continue to send me the PRESS, and send me also a set of back numbers from July last.

Yours Respectfully, GEO. E. BILZ.

Sitka, Alaska, Jan. 25, 1881.

NEVADA.—Senator Jones naturally does not like the statement going the rounds of the press about the decadence of Nevada. He denies the assertions, and says: Nevada is in a prosperous

HOME AGAIN AFTER A WET DAY'S WORK.

condition. There is an impression in the East that our State government is so expensive that we think of abridging it and becoming a Territory again. This is not the case. Our people do not know that they have a government—that they have not felt it burdensome at all. Our system of taxation is such that the poor people do not feel the taxes. We are taxed according to our income. A mine is taxed for what it produces, so that it pays taxes on a part of its expenses, and comparatively speaking, the burden is not felt. In the East, taxes cannot be levied in that way, because there are too many rich men. In Nevada there are only a few rich men, and they cannot do much. Consequently, when a lode gives out like the Comstock, the revenue of the government falls off. Now, what, under such circumstances, does the Legislature do? It goes to work and cuts down salaries and expends right and left, to make the liabilities less than the receipts. We have no debt, and our miners are doing well, there being no State or Territory in the Union where mining is carried on so scientifically and systematically as it is in Nevada. The idea that we desired to be annexed to California, or return to a Territorial government, is absurd.

NEW GOLD MINES IN CHILE.—From a correspondent of the PRESS in Valparaiso, Chile, we learn that there is quite a gold fever in Leluanco, Indian district, over new discoveries. He says: "No one knows the truth yet over the fabulous stories told of the large tract of gold belt. It is to be hoped our people will not be fooled enough to come down here to suffer and meet disappointments. Better stay at home and let well enough alone."

THE HOMER MINING INDEX says: If miners in camps where the ore will admit of it, would go to work with their own arrastras instead of waiting for capital or for mills, we could have more prosperous camps and more well-fixed miners. This is something we have been urging upon miners for a long time. These miners who have started arrastras are better off than those who have waited to sell.

## Legislative.

It has become apparent that the Legislature will not have time to even consider half the bills before it. The dead-lock on the Debris Act Repeal question has hindered business greatly. The Legislature seems no nearer now to a solution of the problem than when it began its labors. Governor Perkins, however, asserts positively that he will not call an extra session. In an interview with Dr. May, on Wednesday, he said: "My decision is final. If no appropriation bill is passed, I shall run the State on credit for two years before I shall ever consent to call an extra session. And I can assure you," added his Excellency, "that this resolution cannot be shaken." The debris men will not consent to bring up the Murphy bill, and the anti-debris men will not permit any other bill to get ahead of it. Thus there is a dead-lock, which probably cannot be broken, as it will be absolutely impossible to get through the file in the short time remaining for work. About 1,000 bills are before the Legislature, and less than a dozen have been passed.

From a statement by Mr. Hutchings, guardian of Yosemite Valley, before a Legislative Committee, it seems that the revenue derived from the State by rents and leases is \$43,000 per year, of which half is paid out to the guardian. The valley was the only property owned by the State which yielded any revenue, and it could be made to pay far more than it did at present if new views were opened up, so as to make it more attractive. For the improvements mentioned, the Commissioners were of the opinion that an appropriation of \$24,000—\$12,000 this year, and \$12,000 next year—should be asked from the Legislature. It is to be hoped that the trails, now under private ownership, will be

side purchaser for value until the same is so entered upon the books of the corporation as to show the names of the parties by and to whom transferred, the number or designation of the shares, and the date of the transfer.

S. B. 209, to add a new section to the Penal Code, to be known as Section 307, to prevent the sale of liquors and tobacco to miners (by Mr. Bart), was passed.

A bill to prohibit the killing of domestic animals, or the sale or delivery of meat Sunday, was introduced in the Assembly by Howard of San Francisco.

Senator Hill introduced a concurrent resolution, asking our Senators and Representatives in Congress to use their influence to secure an appropriation of \$200,000 for the construction of a breakwater in Monterey harbor.

Paulk has introduced a Labor Bureau bill of similar import to that introduced by Enos. A committee of the Trade Unions of San Francisco is in Sacramento in the interests of the bill. A commissioner, who shall have charge of the bureau, is to be elected at the same time with legislative officers, and he is to have a salary of \$3,000 per year. His duties are to obtain accurate statistics of all the industries of the State, mechanical, mining, transportation, clerical and unskilled; the report on the amount of capital invested in lands, buildings, machinery, material and the means of production and distribution generally; the number, age, sex and condition of employees; on the apprenticeship system in skilled labor; average hours of labor; net wages; number and condition of the unemployed, with their age, sex and nationality, together with the cause of their idleness; the sanitary condition of lands, workshops, dwellings; cost of rent, fuel, clothing, water, in the various localities of the State; and finally as to the extent to which labor-saving machinery is employed, to the displacement of hand-labor. He is also to be empowered to ascertain the number and condition of the Chinese in this State; the same general facts in regard to their employment and mode of life as he is required to furnish relating to white laborers; to that extent their employment comes into competition with the whole industrial class of this State. Prison competition is to be inquired into also, and all the facts connected therewith reported. A deputy at \$1,800 per annum, office expenses and clerk hire are to be allowed the Commissioner.

Wm. Johnston has introduced an act authorizing the Capitol Commissioners to erect on Capitol grounds the Sutter Memorial and Industrial Exposition building.

Lampson has introduced a bill appropriating money for the purchase of trails within the Yosemite grant, and to improve the territory therein.

Paulk has introduced another drainage bill, to amend Sec. 20 of the debris law, and Platt one to amend Secs. 14, 20, 25 and 29 of the same law. Paulk's bill raises the miners' tax from half a cent to three cents on each miner's inch of water.

## The Miner's Cabin.

The little sketch on this page will remind many people, now residents of cities, of old days in the mines. And it will also be recognized as truthful by those who still "bach it" in mining regions of the coast. The storms of this winter must have brought to many a fire-side recollections of days when "roughing it" was experienced by the head of the family, and when he came into the cabin wet and weary to rest and dry himself by the blazing open fire.

And these things are not recollections only; they are still being experienced by the hardy miners of this coast. Hundreds of cabins dot the hill-sides, near the numerous mining camps, which are scattered through the mining regions. In all of these two, three, or four miners live on pretty much the same fashion that miners did 20 or 30 years ago. True, there are more hotels and boarding-houses, and more miners working for wages, and less for themselves, than there were in those "days of gold." Yet the miner's cabin of romance is still a reality as well. Perhaps there would be very little romance in the life if many of us were to return to it again after a lapse of years, wedded, as we are, to the artificialities of civilization; but we venture to assert that few look back to their days of rough living, hard fare, and hard work, with the pleasurable excitement provoked by the miner's vocation, without regret, and a wish that the same selfishness that prevailed among men then would exist now. A hard, wet day's work in a claim, in a rain-storm when water was plenty and the sluices full, instead of bringing ill humor and grumbling, brought joy and good humor, as is depicted on the faces of the bonest miners in our sketch.

MECHANICS' INSTITUTE.—In order that every requirement of the law might be complied with, a meeting of the members of the Mechanics' Institute was called, for the purpose of legally empowering the Trustees to sell or mortgage the property at present utilized as a library. The desired power was conferred by resolution, and the meeting adjourned without transacting other business.

W. N. LOCKINGTON has succeeded to the establishment at No. 520 Fifth street corner Bryant, where ore are tested, jewelers' sweeps worked, and assaying and amalgamating attended to.

**MINING AND FARMING LAND.**—It would save a great deal of annoyance to prospectors, as well as to other parties concerned, if those having, or pretending to have, mining ground, would record and work their mines. The law is plain upon this subject. This is a mining region, and we have mining regulations, which, if adhered to, will save a great deal of trouble. We have invited prospectors to come here and search for the hidden wealth, the development of which makes good times, and creates a market for the produce of our gardeners and ranchers. Take away the mineral right of the undeveloped mineral lands of this Divide, and our gardeners and ranchers will soon see such hard times as they never experienced before. And still we have men right in Georgetown, who would assist in "proving" the mineral off every acre of land which is not secured by a mining patent; men who, without the support derived from miners, would starve. Let the mineral character which the All-wise Creator has stamped upon this mineral belt, remain as the law of the land has rightly recognized it. Let no scheming corporation attempt to change the character of these lands by "law," and thus cause hundreds of miners to pay excessive tribute to them. The wants of agriculture do not demand these lands.—*El Dorado Gazette.*

The present financial condition of North Idaho is thus depicted by the Lewiston Teller: Our mines have produced less than their usual quantity of gold dust. A few thousand head of horses and cattle have been sold for cash at low figures. A few thousand pounds of wool and hides have been shipped. Our wheat shipments have been light. Of bacon and lard we have not raised enough for home supply, but have been compelled to ship from below. The average farmer is about finding out that the surplus product of his farm during the past year has been barely equal to his family expenses and the payment of hired labor.

611 and 613 Front Street, San Francisco

## Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

**A. J. SEVERANCE & CO.**  
Office, No. 320 Sansome street, Room 10.

## SAVE YOUR GOLD AND SILVER.

I am prepared to demonstrate, if miners will bring me from 500 pounds to a ton of their ores, that I can save from 25 to 100 per cent. more than any other machinery now in use. I will make no charge.  
Machinery can be seen in operation every day at No. 143 Fremont Street.

M. B. DODGE.

## USEFUL BOOKS

Relating to Casting and Founding, Electricity, Electric Light, Engineering, Drawing, Manufacture of Gas, Heat, Indicator Diagram, Link Motion, Mechanics, Screw Cutting, Slide Valve, Steam Boilers, Steam Engines, Steel, Turning, Wire Gauge, Workshop Receipts. Descriptive Catalogue sent prompt on application.

**E. & F. N. Spon, 446 Broome St., N. Y.**

## BOILER COVERINGS.

Plastic Cement and Hair Felt, with or without the Patent "AIR SPACE" Method. Cement ready for use by the barrel.

**G. C. FOWLER, No. 415 Pacific St., S. F.**

## MOREY & SPERRY,

MANUFACTURERS OF

## Gold and Silver Grinding and Amalgamating Machinery

**HOWLAND'S PULVERIZER** Takes the Place of the Cumbrous Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs \$1,500 ready for the belt. Will crush one per hour of hard quartz that will pass through a 40-mesh screen. The wear is less in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and O, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuously. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

Stamp Mills' Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supply. Iron Work complete for Wood Frames, also.

**SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.**

Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

**MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.**

## PACIFIC MACHINERY DEPOT.

## H. P. GREGORY & CO.,

San Francisco, Cal., September 23, 1880.

## DEWEY & CO.'S

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Offices, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 202 Sansome St., S. F.**

and 110 Liberty St., N. Y. City.

**PARKE & LACY, Sole Agents, 21 and 23 Fremont St., S. F.**

## THE IMPROVED INGERSOLL Rock Drill and Air Compressor.

The undersigned having been appointed sole agent for the Pacific coast, will keep always on hand a large stock of the various sizes, together with duplicate parts, all of which he will sell at factory prices. The Ingersoll is the only Rock Drill now in use on the Comstock.

**GEO. R. FOARD, GEN'L AGENT,**  
No. 18, First St., S. F.

## CAUTION.

To the Public Generally.  
Notice is hereby given that George R. Foard, of No. 18 First Street, San Francisco, is the sole authorized agent for the sale of our manufactures, consisting of Rock Drills, Air Compressors, and duplicate parts of either in the territory known as the Pacific Slope, and that no other person or persons have any right or authority to represent themselves as the agents of this Company within the above mentioned territory.

Also, take notice, that all persons manufacturing, or using any Rock Drills, Air Compressors, or duplicate parts of either, manufactured by others, embracing in their construction the mechanical inventions and appliances covered by the Patents owned by this Company, will be prosecuted for such infringement.

INGERSOLL ROCK DRILL CO.

New York, November 30, 1880.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by **DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.**

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

**Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.**

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, \$7.50

**ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.**

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3.00 coin, postage free.

## LEACHING

## Gold and Silver Ores,

By C. H. AARON.

The most complete Hand-book on the subject extant, 164 pages octavo. Illustrated by 12 Lithographic Engravings and Four Woodcuts.

Fully indexed. Plainly written for practical men.

In cloth, \$3.00. Sold by

**A. J. LEARY, Stationer,**  
402 & 404 Sansome Street, San Francisco.

Send for Circular.

## CALIFORNIA Electric Light Company.

Owners of the Brush System of Electric Lighting for the Pacific Coast.

Apparatus for sale for Mines, Mills, Manufactories, etc. Plating Machines and Machines for treating Ore manufactured to order.

Electric Light furnished on all the principal streets the city.

Office—No. 119 O'Farrell Street,  
SAN FRANCISCO, CAL.

**Metallurgy and Ores.**

**WM. D. JOHNSTON,**  
[Formerly Chief Assayer with Thos. Price.]  
**ASSAYER AND ANALYTICAL CHEMIST,**  
118 & 120 Halleck Street,

ASSAYING TAUGHT.

Personal attention insures correct Returns.

**Nevada Metallurgical Works,**  
No. 23 STEVENSON STREET,  
Near First and Market Streets, S. F.  
ESTABLISHED, 1869. C. A. LUCKHARDT, Manager.

Ores Worked by any Process.  
Ores Sampled.  
Assaying in all its Branches.  
Analyses of Ores, Minerals, Waters, Etc.  
Working Tests (Practical) Made.  
Plans and Specifications furnished for the most suitable process for working Ores.  
Special attention paid to Examinations of Mines, plans and reports furnished.

C. A. LUCKHARDT & CO.,  
(Formerly Huhn & Luckhardt.)  
Mining Engineers and Metallurgists

**JOHN TAYLOR & CO.,**

IMPORTERS OF AND DEALERS IN

**ASSAYERS' MATERIALS,**  
**MINE and MILL SUPPLIES,**

**CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
GISTS' GLASSWARE AND SUNDRIES, Etc.**

118 and 120 Market Street, and 15 and 17  
California St., San Francisco.

We would call the attention of Assayers, Chemists,  
Mining Companies, Milling Companies, Prospectors, etc.,  
to our full stock of Balances, Furnaces, Hutties, Crucibles,  
Scaffolds, etc., including, also, a full stock of  
Chemicals.

Having been engaged in furnishing these supplies since  
the first discovery of mines on the Pacific Coast, we feel  
confident from our experience we can well suit the demand  
for these goods both as to quality and price. Our  
New Illustrated Catalogue, with prices, will be sent on  
application.

Our Gold and Silver Tables, showing the value per  
ounce Troy at different degrees of fineness, and valuable  
tables for computation of assays in grains and grammes,  
will be sent free upon application. Agents for the Patent  
Plumbago Crucible Co., London, England.

### DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company.

San Francisco, February 2, 1881.—At a meeting of the Board of Directors of the above named Company, held this day, dividend (No. 25) of Seventy-five (75) Cents per share was declared, payable on Saturday, February Twelfth (12), 1881, at the office in this city, or at the Agency of the Nevada Bank of San Francisco, in New York. WM. WILLIS, Sec'y.

Office—Room No. 29, Nevada Block, No. 309 Montgomery Street, San Francisco.

Booth Gold Mining Company.—Location of

principal place of business, San Francisco. Location of works, Auburn, Placer County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the Second (2) day of February, 1881, an assessment, No. Three (3), of Three (3) Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 310 Pine Street, Room No. 44, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Seventh day of March, 1881, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the Twenty-eighth (28) day of March, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors.

GEO. R. SPINNEY, Sec'y.

Office—Room No. 44, No. 310 Pine Street, San Francisco, Cal.

## ST. DAVID'S,

A FIRST-CLASS LODGING HOUSE  
CONTAINS 118 ROOMS.

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from \$2.50 upwards.

R. HUGHES, Proprietor.

At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

## INCERSOLL ECLIPSE ROCK DRILLS.

The Most Economical Air Compressors in the Market.

## MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.
